The most reliable authorities say that Saint Denis of Paris was sent by the Pope to Gaul about 250 A.D. His mission was most successful and many pagans were converted to Christianity. The number of his disciples attracted the attention of the Roman governor who caused the arrest of Denis and several of his companions, among whom were Eleutherius, a deacon, and Rusticus, a priest. The Christians, refusing to denounce Christ and offer sacrifice to the gods, were tortured and put to death. The bodies of Denis, the priest, and the deacon were thrown into the Seine. Catulla, a Christian woman, recovered the bodies and gave them burial. Later a church was built over the place where the bodies were interred. Dagobert I. built (about 636) here the Abbey of Saint Denis. His feast, in the calendar of the Roman Catholic Church, is 9 October. Consult: Butler, 'Lives of Saints'; Taillar, 'Apostolate of Saint Denis'; Vereilly, 'Vie de Saint Denis.'

Denis, St., săñ dė-nē, France, town in the department of the Seine, six miles north of Paris, lying within the lines of forts surrounding the capital. It has numerous manufactories of calicoes and other printed cotton goods, gelatine, candles, saltpetre, and soda. In the latter part of the 3d century a chapel was erected on or near the present site to the memory of St. Dionysius or Denis, who is said to have been martyred here. For this chapel Dagobert I., in the 7th century, substituted a large basilica, in which he himself was interred, and afterward it was used as the burial place of the kings of France. Changes were made later but under the Abbot Suger the building became most beautiful. The chapel was destroyed during the Revolution and the bodies of the kings put into a cannon pit. Many of the tombs and relics were, however, preserved in the Musée des Petits Augustins. Napoleon's decree of 20 February 1806 made St. Denis again the burial place of the reigning family of France. Louis XVIII. obliterated from St. Denis all traces of Napoleon's rule; but under Napoleon III. the famous architect Viollet-le-Duc effected a mag-

nificent restoration of the ancient building. The present stained glass windows are all modern but one. Pop. 53,053.

Denison, Charles Wheeler, American poet and prose writer: b. New London, Conn., 11 Nov. 1809; d. 14 Nov. 1881. He published: 'The American Village and Other Poems' (1845); 'Out at Sea,' poems (1867); 'The Child Hunters' (1867); and a series of biographies: 'The Tanner Boy' (Grant); 'Winfield the Lawyer's Son' (Hancock); etc.

Denison, Frederic, American clergyman: b. Stonington, Conn., 28 Sept. 1819; d. Providence, R. I., 16 Aug. 1901. He was graduated from Brown in 1847; was chaplain in the Union army during the Civil War, and held several pastorates. He has written: 'The Supper Institution'; 'The Sabbath Institution'; 'Notes of the Baptists and Their Principles in Norwich, Conn.'; 'Westerly and Its Witnesses'; 'History of the First Rhode Island Cavalry'; 'Picturesque Rhode Island.'

Denison, George Taylor, Canadian soldier: b. Toronto 31 Aug. 1839. He was educated at Upper Canada College and Toronto University, was called to the bar in 1861, and practised law in Toronto, in 1877 being appointed police magistrate of the city. In 1872 and 1873 he was sent to England as commissioner in behalf of immigration. He began his military service in 1855 and was made lieutenant-colonel in 1866; he was in active service in the Fenian raid of 1866 and in the Riel rebellion in the Northwest Territory in 1885. His 'History of Cavalry' (1877) won the first prize offered by the emperor of Russia for the best book on the subject; he has written also: 'The National Defenses' (1861); 'Canada, Is She Prepared for War?' (1861); 'The Fenian Raid at Fort Erie' (1866); and 'Canada and Her Relations to the Empire' (1895). He was one of the founders of the "Canada First" party, and through his contributions to periodical literature and public addresses has been known as an earnest advocate of Canada's rights and of the preservation of the unity of the empire.

Denison, John Evelyn, English politician, for 14 years speaker of the British House of Commons: b. Ossington, Nottinghamshire, 27 Jan. 1800; d. 7 March 1873. Educated at Eton and Christ Church, Oxford, he entered Parliament in 1823, and was a lord of the Admiralty 1827–8. In 1872 he retired from the speaker's chair, and shortly after was created Viscount Ossington. He was a D.C.L. of Oxford; and it was on his suggestion that the "Speaker's Commentary" to the Bible was undertaken.

Denison, John Henry, American Congregational clergyman: b. Boston, Mass., 3 March 1841. He was college pastor at Williamstown for five years, and is the author of 'Christ's Idea of the Supernatural' (1895).

Denison, John Ledyard, American writer: b. Stonington, Conn., 19 Sept. 1826. He has published: 'Pictorial History of the Wars of the United States' (1850); 'Illustrated History of the New World' (1872); 'Pictorial History of the Navy of the United States' (1860).

Denison, Mary Andrews, American author: b. Cambridge, Mass., 26 May 1826. She married Charles Wheeler Denison (q.v.) in 1846 and became connected with the 'Olive Branch' of which he was on the editorial staff. Contributing frequently to the American and later to the English magazines, she wrote sketches of native life while living in British Guiana, where her husband was American consul. Among her numerous works are: 'Home Pictures' (1853); 'Gracie Amber' (1857); 'Old Hepsey, a Tale of the South' (1858); 'Opposite the Jail' (1858); 'The Lover's Trials' (1865); 'Annie and Teely' (1866); 'That Husband of Mine' (1874), which sold more than 200,000 copies in a short time; 'That Wife of Mine' (1877); 'Rothmell' (1879); 'Mr. Peter Crewelt' (1878); 'His Triumph' (1883); 'What One Boy Can Do' (1885). She has also written many Sunday-school books.

Denison, Iowa, city, county-seat of Crawford County; on the Boyer River, and on the Chicago & N., and the Illinois C. R.R.'s; about 100 miles west by north of Des Moines. Flouring mills and creameries are the chief manufactories. It is the site of one of the Denison Normal and Business schools, a private institution. Pop. (1900) 2,771.

Denison, Texas, city in Grayson County, on the Missouri, K. & T., the Houston & T. C., and the Texas & P. R.R.'s; 106 miles north of Dallas. It is a noted cattle-shipping place; the trade centre of the surrounding agricultural country, including the Indian Territory; and an important railroad point. It has manufactories of cotton, iron, and machinery, daily and weekly papers, high school, electric lights, waterworks, two national banks, St. Francis Xavier's Academy, and the Washington School. It was settled in 1872 and is now governed under a charter of 1893. Pop. (1902) 12,986.

Denison University, an educational institution in Granville, Ohio; founded in 1831, under the auspices of the Baptist Church, and intended at first as a manual training school. The manual training was soon abandoned, and the theological department was dropped in 1870. The Shepardson College for Women, established in 1887, became affiliated with the university in 1900. In 1902 the library contained about 22,000 volumes, and the attendance was 500.

Denitrifica'tion. See NITRIFICATION.

Den'izen, in English law, an alien who by letters patent has been constituted a British subject permanently or for a time. A denizen is in a middle state between an alien and a natural born or naturalized subject. He may take lands by purchase, or derive a title by descent through his parents or any ancestor, though they be aliens. No denizen can sit in Parliament, or take office, civil or military.— In natural history, an animal or plant originally introduced into a country or district by human agency, which now maintains itself there without the direct aid of man, is called a denizen of that country or district.

Den'man, Thomas, BARON, English jurist: b. London 23 Feb. 1779; d. 22 Sept. 1851. He was associated with Brougham in the courageous defense of Queen Caroline (1820), and shared his consequent popularity. He sat in Parliament in 1818–26, and was attorney-general in Earl Grey's administration in 1830–2; succeeded Lord Tenterden as lord chief justice of England in 1832; and was raised to the peerage in 1834. He retired from the bench in 1850.

Denmark (Danish, *Danmark*), a northern kingdom of Europe, between lat. 54° 40′ and 57° 45′ N., and lon. 8° 4′ and 12° 45′ E. It is composed of a peninsular portion, and an extensive archipelago, lying east of it, with a few scattered islands on its west side; and is bounded north by the Skager Rack, which separates it from Norway; northeast and east by the Cattegat and Sound, which separate it from Sweden; east and south by the Baltic; south by the duchy of Sleswick; and west by the German Ocean or North Sea. The peninsular portion is composed of Jutland, and measures, north to south, 185 miles with a breadth varying from 40 to 108 miles — its broadest part being from Fornæs Point, lat. 56° 26′ 42″ N., on the east coast, to Nissum Fiord on the west coast. The numerous islands lying east of Jutland are mainly comprised in two groups: — first, that of Själland, Seeland or Zealand, including, besides the large island of that name, the small adjoining islands east of the Great Belt, the principal of which are Amager, Langöe, Taröe, Masnedöe, Agersöe, Lolland or Laaland, Falster, and Möen, and second, the Fünen or Fyen group, comprising, besides the large island of that name, the neighboring islands west of the Great Belt, including Langeland, Aeröe, Fanöe, Taasinge, and others. Besides these, there are the outlying islands of Lessöe and Anholt, in the Cattegat, and Bornholm in the Baltic.

Besides these territories, Denmark possesses the Färöe Islands and Iceland, in the North Atlantic Ocean; Greenland, in the Arctic regions; the islands of Santa Cruz or Saint Croix, Saint Thomas, and Saint John, in the West Indies. She also formerly had some establishments on the coasts of Guinea, in Africa, and of Coromandel, in India; but these have been sold to Great Britain.

For administrative purposes Denmark is divided into 18 counties (*Amter*), each county being subdivided into *Herreder* or hundreds. Copenhagen is the capital, and among the towns of importance are Aarhuus, Odensee, and Aalborg.

The following table gives the main divisions of the country, with their area and population, as well as the total area and population of the whole monarchy, according to the census of 1 Feb. 1901:

Divisions	Area English sq. m.	Population 1901
City of Copenhagen (Kjöbenhavn) without suburbs	21	378,235
Islands in the Baltic	5,062	1,007,513
Peninsula of Jutland	9,765	1,063,792
Färöe Islands (17 inhabited)	512	15,230
Total	15,360	2,464,770

Previous to 1864 the duchies of Schleswig-Holstein and Lauenburg belonged to Denmark, so that the area of the kingdom was then greater by about 7,360 square miles, the corresponding population being more than a million.

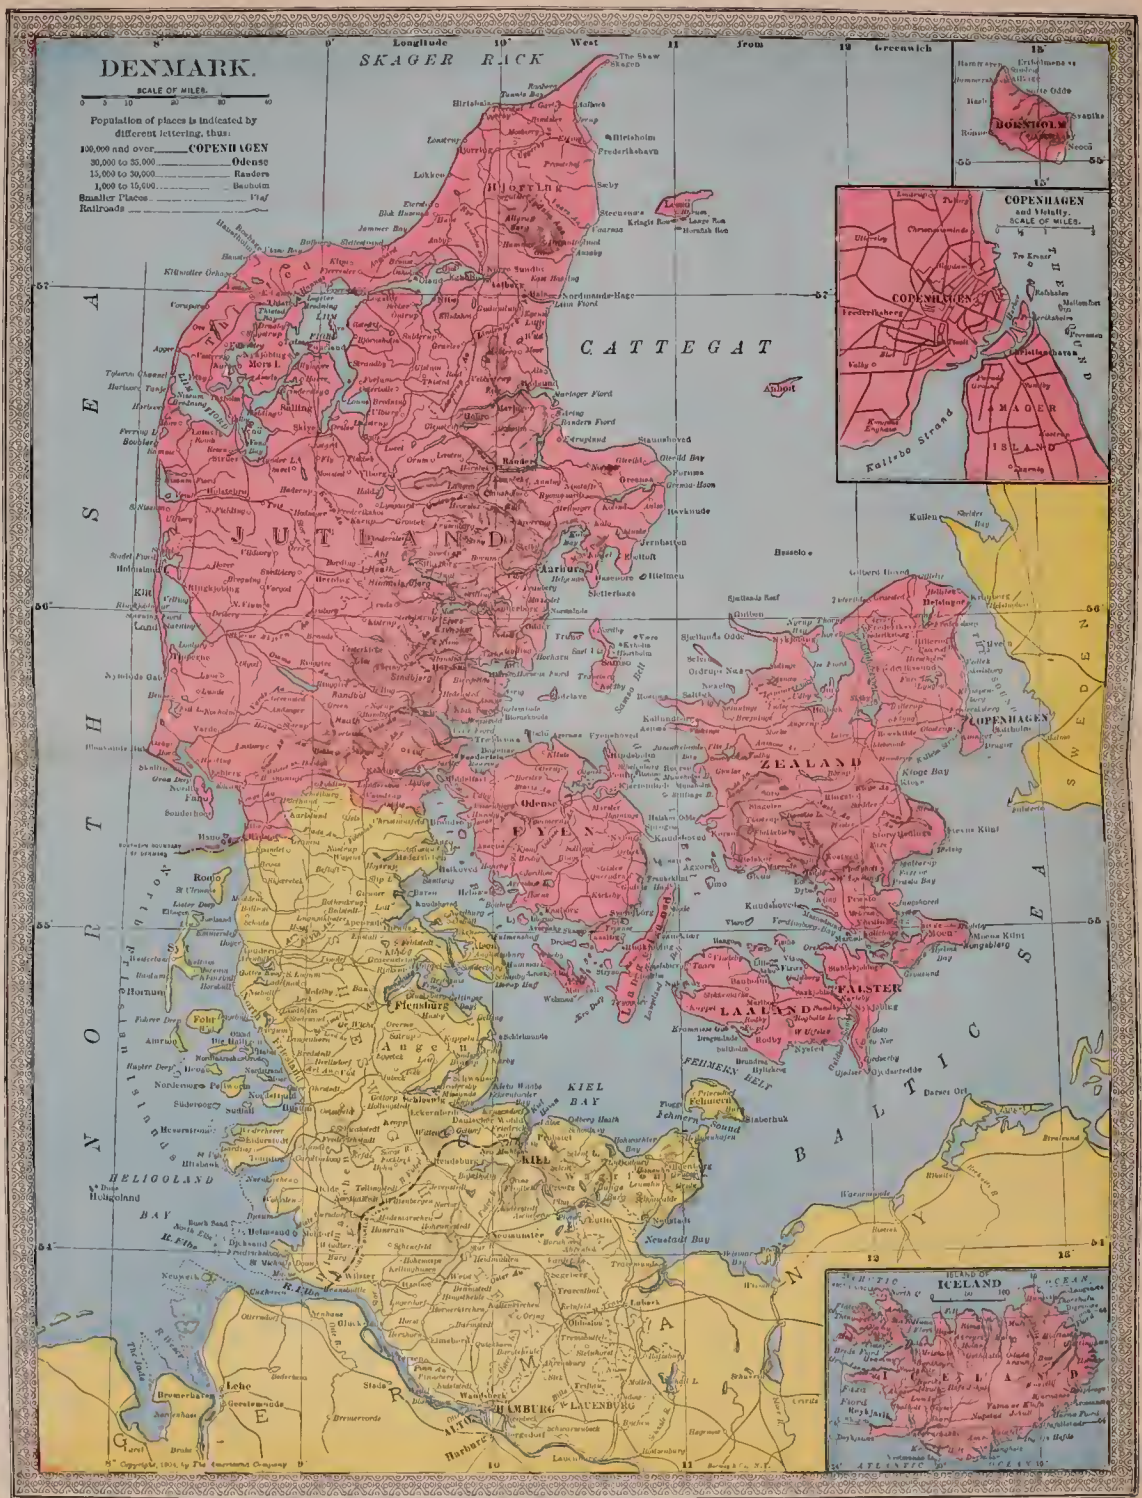
Geology and General Aspect.—Denmark is a very low-lying country, there being no elevation of any consequence throughout the whole kingdom. The greatest height is attained on the eastern side of the peninsula, though even there it never exceeds 550 feet. In respect of geological structure all the rocks belong to the upper series of the Secondary, and to the Tertiary formation, and have been deposited from water in regular strata. The rock most fully developed is the chalk, of which several distinct species have been recognized. The whole west coast is rendered almost uninhabitable by the drift-sand, which has formed an almost uninterrupted line of sterile downs, called *Klitten*, extending from Cape Skagen to Blaavands Hook, a distance of nearly 200 miles. Along parts of the coast of Jutland are extensive flats or plains, which have been wrested from the sea, and which are protected from its encroachments by huge dykes, as in Holland.

Rivers, Lakes, Sea-arms, Ports, etc.—Denmark has no large rivers; the principal is the Guden, which is navigable for part of its course. Less important streams are the Holm, the Lönborg, and the Stor Aa. All the others are insignificant streams. There are no rivers in any of the islands, but brooks and streamlets abound. There are a number of lakes, particularly in Jutland, and several in the larger islands; but they are all small. The most remarkable of the physical features of Denmark are its lagoons or fiords, winding inlets of the sea, that penetrate far into the land. The largest of these is the Lymfiord, or Liim Fiord, in Jutland, which, entering the land in the Cattegat, winds its way quite through the peninsula, and is separated from the North Sea merely by a narrow strip of land which storms have ruptured in one or two places. Most of the streams, lakes, and coasts of the kingdom are well stocked with fish. Besides these inland seas, the Great Belt separates the large islands of Seeland and Fünen, and the Little Belt flows between the latter and the coast of Jutland and Schleswig. Denmark is well supplied with excellent seaports, the most important being Copenhagen, Aalborg, Aarhuus, and Randers.

Climate.—The prevailing characteristic of the climate of Denmark is humidity; it is also remarkably temperate for so northerly a region; both the result of the lowness of the land and of its proximity to the sea on all sides. The heats of summer are great, sometimes excessive. The mean temperature of the year is 47°. The shortest day is about 6½ hours, the longest 17½ hours.

Animal and Vegetable Products.—Horses and cattle are reared in great numbers, and both are excellent. Large flocks of sheep are kept; but rather for the flesh than the wool, which is coarse and short. Swine are also reared to a great extent. Deer, stags, roes, hares, and a variety of other game are met with in the royal and other forests, but do not abound anywhere else. Wild fowl — including the eider-duck, so famous for its down — are numerous. Poultry of all kinds are raised, particularly geese. Potatoes, barley, oats, rye, beans, pease, tares, flax, hemp, madder, and tobacco are raised; wheat in Laaland and buckwheat in Fünen. Among the garden fruits are apples, plums, cherries, pears, and nuts. Few of the great forests with which the country was once covered now remain. Government, however, has of late years paid some attention to this source of national wealth, and has taken measures for the protection and better management of the forests. The larger forests are now confined to the east side of Jutland and to Seeland.

Agriculture, Cattle Breeding, etc.—Although not particularly favored by nature, Denmark is



yet pre-eminently an agricultural country. Of the total area 80 per cent is productive; about one sixth of the unproductive area is bog. The land is greatly subdivided, as the law interdicts the union of small farms into larger, and encourages the division of landed property. The kinds of grain most largely cultivated are barley, oats, rye, and wheat, the greatest area being occupied by oats, the second by barley. Rye is grown throughout the whole peninsula, and in the islands of Funen and Seeland, and some of the islands on the west coast. From this grain the greater part of the bread used in Denmark is made. Wheat, which occupies but a comparatively small area, is grown chiefly on the islands of Laaland and Langeland, and on large estates in other quarters of the kingdom. The yearly yield of the cereal crop is said to be larger than that raised by any corresponding European population except that of Mecklenburg. The oats crop of 1898 amounted to 39,920,052, the barley crop to 21,048,504, that of rye to 15,528,240, and that of wheat to 2,878,120 bushels. The value of these crops was estimated at $48,856,830, the total value for all crops for that year being $91,091,910. Buckwheat is cultivated to some extent in Jutland, as also in the island of Fünen and elsewhere. Potatoes, which were introduced into Denmark early in the 19th century, are now very generally cultivated. Herbage plants and grass are carefully cultivated. Beans, pease, and tares are also extensively cultivated throughout the whole country and form an important article of food. Flax, hemp, hops, tobacco, madder, lavender, and mustard-seed are grown, but not in sufficient quantities to supply the home demand. The part of the kingdom best adapted for the production of fruit is the island of Fünen. Cattle-breeding, grazing, and the dairy engage the greatest share of the farmer's attention in Denmark. Large and increasing numbers of cattle are annually exported from the country. A great increase has of late years taken place also in dairy produce, and the export of butter is now the main source of the wealth of Denmark. The rearing of horses is extensively carried on. The old Danish breed is found chiefly in Jutland. Those from the islands are said to be of Tartar descent, and are small, but strong and active. Sheep-rearing is on the decline in Denmark. Eggs are now largely exported, and the rearing of hogs is much attended to; the greatest number are reared in the vicinity of the woods in East Jutland. The rearing of bees occupies a large share of attention, particularly in the island of Funen, and wax is largely exported.

Fisheries.—The fisheries are an important branch of national industry. Next to the herring the turbot, torsk, and salmon are the most abundant sorts of fish. Oyster banks occur on the east coast of Jutland, near its northern extremity, and near the island of Lessöe. Fish-ponds were at one time very general over the country, and were profitable. The seal fisheries of Denmark are considerable, the principal station being the island of Anholt.

Manufactures.—These are comparatively insignificant, and do not comprise any peculiar or national manufacture. There are, however, one or two articles which have attained a considerable reputation; these are the woolens and earthenware of Jutland, the former a domestic manufacture; the wooden clocks of Bornholm, and a superior kind of stove made in Copenhagen. The manufacture of paper is pretty extensive, and has of late years been greatly improved and extended. There are also iron-foundries, sugar-refineries, some extensive tanneries, and many distilleries. Randers in Jutland, and Odensee in the island of Funen, were formerly celebrated for the manufacture of gloves; but the peculiar kind of leather from which they were made, and in which their excellence consisted, is now prepared in other countries. The people of Denmark bake their own bread, brew their own beer, and spin the greatest portion of the woolen yarn afterward knitted into stockings or woven into cloth by the village weaver. The women make up their own dresses, and frequently the clothes of their husbands; the latter make the wooden shoes and slippers, and manufacture the greater part of the house furniture and farming utensils. Several of the manufacturing establishments of Denmark belong to the government. Among these establishments are a royal porcelain manufactory in Copenhagen, and a royal cloth manufactory in Irsseröd, which supplies cloth for the army.

Commerce, Canals and Railways.—The commerce of Denmark is carried on chiefly with Great Britain, Germany (especially Sleswick-Holstein), Norway, Sweden, and Russia, Great Britain and Germany possessing by far the largest share. The chief imports are textile goods (especially cottons), metals and hardware, wood and articles made of it, coal, bricks, salt, manure, oil, oil-cake, fish, rice, coffee, fruit, glass-ware, paper. The principal imports are cotton manufactures, coal, and iron. Considerable quantities of cottons are imported by Denmark from Germany. The manufactures of Denmark being, as already mentioned, insignificant, the articles exported consist chiefly of agricultural products. The declared value of the total imports in 1876 amounted to $63,583,790, and that of the exports to $50,185,285; in 1898 they were $126,386,115 and $89,602,770 respectively. In 1898 the mercantile marine of Denmark consisted of 3,696 vessels, with a total tonnage of 350,108 tons. The coasting trade is extensive, and is largely shared in by foreigners. There are several canals in Denmark, but none of them of any great consequence. The country is now pretty well supplied with railroads, there being lines running across the islands of Seeland, Funen, Laaland, and Falster, which, assisted by ferries, gives direct communication with the capital on the one hand and with Jutland on the other.

Moneys, Weights, etc.—Since 1 Jan. 1875, the unit of the Danish monetary system has been the *krona* or crown, equal to about 28 cents. The krona is divided into 100 *öre*. The commercial pound weight is heavier than the United States weight of that denomination, 100 pounds Danish being equal to 110¼ pounds avoirdupois. The weight of 100 pounds Danish is known as the *centner*. The principal measure used throughout Denmark for corn is the barrel or toende, which contains 7,776 Danish cubic inches or 8,488 English cubic inches, and consequently is equal to nearly four bushels. The *viertel*, used for wine and liquor, is equal to 1.7 gallon. The standard measure of length is the foot, which equals 12.356 inches. The Danish mile is 4.684 English miles. 16 Danish square feet are nearly equal to 17 English square feet. A tonne or toende of land is as much land as can be

Copyright, 1904, by The Times Mirror Company

sown with one toende of rye, one of barley, or two of oats, and is equal to 1.36 acres.

People, Education, Religion.—The population of Denmark is composed almost exclusively of Danes, with a few thousand Jews and others. The Danes have regular and well-formed features, fair or brownish hair, and blue eyes, with muscular frames; they are kind-hearted, honest, and simple-minded, and continue to maintain their ancient reputation of being bold and hardy seamen. All classes are noted for their hospitality, which is indeed a characteristic of the nation. At the head of the educational institutions stand the University of Copenhagen and the Holberg Academy at Soröe. Elementary education is widely diffused, although in this regard Denmark is no longer so pre-eminent as formerly; it is compulsory for children between the ages of 7 and 14 years, poor parents paying only a nominal sum toward the government or parochial schools, of which there are about 3,000. There are training colleges for teachers, and classical and other higher education is afforded by a large number of colleges in the more important towns, with the university of Copenhagen (1,300 students) for the centre of the entire system. Denmark has also a theological seminary, a royal surgical college, a veterinary and agricultural school, and numerous military, technical and commercial schools, while 50 "people's high schools" provide instruction in agricultural subjects. There are three public libraries in Copenhagen, of which the Royal Library, with 500,000 volumes, is especially rich in Oriental and Icelandic MSS. The established religion is Lutheran, to which the king must belong; but complete toleration is enjoyed in every part of the kingdom. The Reformation was introduced in 1536, when the Church revenues were seized by the crown. Denmark is divided into seven dioceses, in which there are 1,360 parishes. There are only 31,000 persons not belonging to the Lutheran Church, of whom 4,000 are Jews, 3,600 Roman Catholics, 2,300 Methodists, 1,000 Mormons 4,600 Baptists, and 2,600 Irvingites.

Government, Army and Navy, Finance.— The government of Denmark is a constitutional monarchy, the king being assisted by a cabinet of seven ministers. The crown was elective until 1660, when the people and clergy, impelled by hatred toward the nobles, invested the sovereign (Frederick III.) with absolute power, and declared the succession to the throne hereditary. From that time the crown exercised absolute rule till 1831, when a constitution was granted. This proving unsatisfactory, was superseded in 1848 by the form of government which, with some alterations, Denmark now enjoys. The national assembly or Rigsdag consists of the Folkething and Landsthing, which meet annually, the members receiving a fixed allowance during their sittings. The Landsthing is composed of 66 members, of whom 12 are nominated for life by the king, while the remainder are elected for a term of eight years by certain bodies representing the large taxpayers of the kingdom. The members of the Folkething, whose number is fixed by statute in the proportion of one to every 16,000 of the population, are elected for three years by practically universal suffrage. To this body all budgets must first be submitted; but in the years 1877–87, when the government had a minority in the lower house, the king was induced to give the royal ratification to successive "provisionary budgets," which had never received the assent of the Rigsdag. Nevertheless the financial condition of Denmark is sound and prosperous. The total revenue in the period 1885–95 fluctuated from $15,000,000 to $16,000,000 a year; while the expenditure has repeatedly exceeded $18,000,000. Since the war of 1866, the government has maintained a comparatively large reserve fund to meet any sudden emergency. That fund stood in 1887 at $4,950,000. The total national debt is over $50,000,000, or about $25 per head of the population; but as the investments of the state (in telegraphs, etc.) amount to nearly $25,000,000, this proportion is reduced to less than $15. The decimal system was introduced in 1875, the unit being the *krone*, or crown, of 100 *öre;* the average rate of exchange is 3.6 *kroner* to the dollar. The Danish army numbers 1,200 officers and 46,000 men, inclusive of the landwehr; but only a sufficient establishment for garrison purposes is maintained, and the peace strength is 750 officers and 13,000 men. The total war strength is about 50,000 men, to which an extra reserve of 14,000 could be added on emergency. Conscription prevails, and the period of military service is divided into eight years in the line and reserve, and eight in the extra reserve. The navy is recruited by levies from the coast districts. The fleet comprises some 40 steamers (of which 10 are ironclads, but only one a first-class battleship). The navy numbered in 1888, 134 officers and 1,477 men. There were in 1897, 290 officers and 1,150 men. Besides Copenhagen (q.v.), there are no defensible fortresses, though there are antiquated forts at Helsingör (Elsinore) and Fredericia. The arsenal is at Copenhagen.

History.—The early history of Denmark is lost in the twilight of the saga-period, out of which loom dimly the figures of its heroes, their brave deeds, and daring voyages. Within its borders the Celts had first their home, and from its shores the Angles and Saxons sailed in the 5th century to the conquest of England; while in their place the Danes from Zealand settled on the deserted lands, extending their sway as far south as the Eider. One of their earliest kings, Harald Hildetand, fell in battle against the Swedes in 695; and shortly afterward a branch of the Ynglinger occupied Jutland, where they held a footing for two centuries. One of their kings, Harald Klak, received baptism in 826 from Ansgar, but the introduction of Christianity did not at once place any check on the long accustomed inroads on Frankish territory, or on the piratical expeditions of the Vikings; although the country was soon torn by dissensions between the adherents of the old and new faiths. Gorm the Old, who drove the Ynglinger from the peninsula, and first united the mainland and islands under one rule, was the bitter enemy of Christianity; and although his death in 936 gave fresh vigor to the diffusion of the new faith, yet even its ultimate success was only insured by the zealous support it received from Gorm's grandson, Canute. On his death in 1035 the three kingdoms of his Anglo-Scandinavian empire separated, and his sister's son, Svend Estridsen (1047–76), ascended the throne of Denmark, founding a princely line that flourished 400 years. Internal dissensions and external wars weakened the country, and the introduction of a feudal system raised up a powerful nobility,

and ground down the once free people to a condition of serfdom. Waldemar I. (1157–82) added Rugen to the other Wendish districts of Mecklenburg and Pomerania, and extended his sway over Norway also. Under Waldemar II. the conquests of Denmark extended so far into German and Wendish lands, that the Baltic was little more than an inland Danish sea. The jealousy of the German princes and the treachery of his vassals combined to rob him, however, of these brilliant conquests, and his death in 1241 was followed by a century of anarchy and inglorious decadence of the authority of the crown, during which the kingdom was brought to the brink of annihilation. Under his great-grandson, Waldemar IV., Denmark made a transient recovery of the conquests of the older Waldemars, rousing the jealousy of the Hanseatic League, and the national laws were codified. From his death in 1375 to 1412, his daughter, the great Margaret, widow of Hakon VI. of Norway, ruled not only that country and Denmark, but in course of time Sweden also, with so light yet firm a hand that for once in the course of their history the three rival Scandinavian kingdoms were content to act in harmony. Margaret's successor, Eric, the son of her niece, for whose sake she had striven to give permanence, by the act known as the Union of Calmar (1397), to the amalgamation of the three sovereignties into one, undid her glorious work with fatal rapidity, lost the allegiance and the crowns of his triple kingdom, and ended his disastrous existence in misery and obscurity. After the short reign of his nephew, Christopher of Bavaria (1440–8), the Danes exerted their ancient right of election to the throne, and chose for their king Christian of Oldenburg, a descendant of the old royal family through his maternal ancestress, Rikissa, the great-granddaughter of Waldemar II. Christian I. (1448–81), who was at the same time elected Duke of Sleswick and Holstein, was the founder of the Oldenburg line, which continued unbroken till the death of Frederick VII. in 1863. His reign was followed by half a century of international struggles in Scandinavia. The insane tryanny of Christian II. cost that monarch his throne and freedom; the Danes chose his uncle Frederick I. to be their king, while Sweden was forever separated from Denmark, and rose under the Vasas to be a powerful state. (See Gustavus I.).

Under Christian III. (1536–59), the Reformation was established in Denmark. Christian IV. after his brief share in the Thirty Years' War, proved one of the ablest of all the Danish rulers. His liberal and wise policy was, however, cramped in every direction by the arrogant nobles, to whose treasonable supineness Denmark owes the reverse by which she lost (1658) all the possessions she had hitherto retained in Sweden; and with the relinquishment of these, and consequently of the undivided control of the passage of the Sound, the country's former international importance came finally to an end. The national disgraces and abasement which followed led, in 1660, under Christian's son, Frederick III., to the rising of the people against the nobles, and their surrender into the hands of the king of the supreme power. For the next hundred years, chiefly marked by wars with Sweden, the peasantry were kept in serfdom, and the middle classes depressed; but by the end of the 18th century the peasants had been gradually emancipated, while many improvements had been effected in the mode of administering the laws, and the Danish kings, although autocrats, exercised a mild rule. The miseries of the reign of Frederick VI., who governed as regent from 1784, brought the country to the verge of ruin. Denmark having joined Russia in a compact of the northern powers hostile to England, a fleet was sent into the Baltic, and considerable injuries were inflicted by an attack on Copenhagen, in 1801, under Parker and Nelson. From this the country rallied; but in 1807 the British government, suspicious of an intention on the regent's part to violate his neutrality and take sides with Napoleon, demanded the surrender of the entire Danish navy, to be restored at the conclusion of peace. A refusal was followed by the bombardment of Copenhagen in September, 1807, and the fleet was given up; but this treatment drove Denmark into Napoleon's arms, and with him the kingdom was obliged to co-operate until the close of 1813.

By the congress of Vienna, Denmark was compelled to cede Norway to Sweden. From this period a spirit of discontent grew up in the duchies, degenerating into mutual animosity between the Danish and German population, which led to an open rupture with Denmark in 1848, immediately after the accession of Frederick VII. (For the whole question, see Sleswick-Holstein. After alternate hostilities and armistices, the war was virtually concluded in 1850, by the victory of the Danes at Idsted; but in 1863 the quarrel was renewed. On the death of Frederick in that year, Prince Christian of Sleswick-Holstein-Glücksborg ascended the throne under the title of Christian IX., in conformity with the act known as the Treaty of London of 1852, by which the succession to the Danish crown had been settled on him and his descendants by his wife, Princess Louise of Hesse-Cassel, niece of King Christian VIII. of Denmark. A pretender, backed by German influence and help, at once started up in the person of the eldest son of the Duke of Augustenborg, who assumed the title of Duke Frederick VIII. of Sleswick-Holstein; but his cause was speedily merged and lost sight of by Prussia and Austria in their direct aim of incorporating the duchies with the German Confederation. Denmark, unaided by England and France, allies on whose support she had relied, was forced to go single-handed into the unequal contest. After a brave but utterly futile attempt at resistance, the Danes found themselves forced to submit to the terms dictated by their powerful foes, and resign not only Lauenburg and Holstein, but the ancient crown-appanage of Sleswick. By the peace of Vienna, 1864, the Danish king bound himself to abide by the decision which Prussia and Austria should adopt in regard to the destiny of the severed Danish provinces. The dissensions between these two great powers, which led to the Austro-Prussian war of 1866, resulted in the triumph of Prussia, and since then the duchies have remained an integral part of that state. Since the war, Denmark, although reduced to the narrow limits of the islands and Jutland, has recovered from its fall, and has greatly prospered, in spite of the spread of socialistic opinions, and the political dissensions that have ranged the government and Landsthing, supported by the press of the capital, against the Folkething and majority of the people.

In 1870 war broke out between Germany and France and an alliance was formed between France and Denmark, with a view to the protection of the latter from German aggression. The result of the war was the downfall of the French empire; this treaty was dissolved, and Denmark felt that her safety lay in a strict neutrality. Yet the resentment of the country towards Germany was by no means allayed, and the general population were indignant that so many leading politicians were anxious to draw closer the lines that bound Germany and Denmark together. This indignation frequently broke out into such violent manifestations that at last it became evident that anything like a close alliance and understanding between the two states seemed impossible.

The 5th article of the treaty made between Austria and Prussia (23 Aug. 1866) had given to Denmark some prospect of recovering the northern districts of Holstein. There arose, however, considerable discussion with Prussia about the realization of this hope, and Prussia seemed reluctant to give any guarantee for the restoration of the territory. So long as the Emperor Napoleon was in power, this article, which he had not only suggested, but had maintained and advocated, the hope of Denmark for the surrender of North Sleswig appeared reasonable. After the catastrophe of Sedan (1870) this hope was forever abandoned. The French republic took no interest in Sleswig, Italy was equally indifferent, England was occupied in other matters and had learned in the Crimea to shun all meddling with other people's quarrels. The rage of the Danes was roused in 1879 on learning that Germany was discussing with Austria the abolition of Article 5 in the treaty, and even the Danish Court, by the marriage of the Princess Thyra, in 1878, with the Duke of Cumberland, whose dislike for the Germans was well known, had shared, by anticipation, in this expression of feeling. This national sentiment of the Danes took almost a warlike character. In the Rigsdag, 1873, legislative measures were proposed for the reorganization of the land and sea forces and the fortification of Copenhagen. The ruling party in the Folkethings strongly advocated an increase in the army and navy, and an improvement in the coast fortifications; this was advisable as a demonstration of power which would be of effect in the case of war between other nations, but would also secure Denmark against the encroachments of Germany. The representatives of rural constituencies or Agrarians, however, together with the Radicals, were opposed to an active policy on the part of Denmark. The Conservatives, with the sympathy of King Christian, were for warlike preparations, by the increased national defences.

In 1874 the Liberal party, under Fonnesbech, succeeded Holstein-Holsteinborg's Conservative cabinet, which had been in power since 1870, but even the Liberals failed to overcome the opposition which the Folkething persisted in showing to the proposed expenditure on the military and naval forces. The king therefore called into office a ministry of a purely bureaucratic character, which he had counseled Estrup to appoint. Jacob Brönnum Estrup is a remarkable man. Since he took his seat in the Landsthing in 1864, when he appeared as leader of the Agrarians, he has shown both power and patriotism in his political career, and has done much for the advancement of Danish constitutionalism. His desire has been to render Denmark's place among the Powers secure and independent, to develop its resources, and especially to secure for his country adequate protection in the carrying trade of the world's commerce. The King had found in him a man ready to carry out his wise designs for the little realm. In 1866 he had been a leading spirit in the revision of the constitutional code of Denmark, and he strongly advocated the view of the Conservatives that the Folkething, or lower house of the Rigsdag, had not, like the English House of Commons, the sole right to make appropriations from the public treasury. The Radicals of the Folkething, however, claimed supremacy in all matters of taxation and finance, and formed the Left in that assembly. On the other hand, the King and Landsthing, or upper house, according to the Conservatives, had constitutionally the right of overruling the Folkething. Estrup was on the side of those who would not trust the lower house with the sole control of the exchequer. The government, he maintained, was threefold,—King, Landsthing, and Folkething; where any two of them were united against the third, the majority ought to be paramount in deciding the issue. From the time Estrup was appointed Minister of Finance and President of the Council, the clash of parties increased day by day; Estrup again and again brought forth his measures of warlike preparation; again and again were they defeated. In the Folkething the opposition majority increased with every division. In 1876 this party had 74 members as against 27 supporters of the government. It threw out the Budget of Estrup, and the government was compelled to beat a retreat, although the fortification of Copenhagen went forward. This brought about a crisis in political affairs and also led to a new development in the constitution. Estrup stood his ground and was supported by the press as well as by the public opinion of the capital. He maintained that, according to the parliamentary system of Denmark, he had it in his power to propose a provisional finance measure; that such a measure could be carried by the Landsthing, the upper house, which controlled the Folkething. The measure was carried with the approval of the King, and the fortifications at Copenhagen were on their way to be completed. In 1880 two measures were passed for the increase of the army and navy. The opposition thereupon began what was known as the "Verdorrungspolitik," "The policy of blight," i. e., obstruction. Not only did they oppose the finance measures of the government, but every measure, of whatever kind, proposed by Estrup's party and sanctioned by the Landsthing, they threw out. But the King and the ministry remained firm, and were supported by a large majority of the population of the country.

The fortification of Copenhagen was completed with the assistance of volunteer contributions to the amount of $253,333 33. The financial prosperity of the country was evident. The appropriation made for land defences amounted to $10,033,333 33; the department of railways had expended $17,733,333 33. There was still a large balance in the treasury. The history of Denmark from that time is a history of parliamentary struggle. The Moderates of the Left could not keep pace with the violence of the Radicals, and in 1891 an actual rupture took place. The Moderates desisted altogether from the "policy of blight," or obstruction, and drew nearer and nearer to the Conservatives. The consequence was that the Radicals lost their supremacy in the Rigsdag, and in the elections of April, 1892, forfeited many seats. The opening speech of the prime minister in the Folkething (1892) outlined a policy which was not long in being carried out. The Moderate Lefts supported a measure for land defences; the fortifications projected were quickly finished, and the triumph of the Conservative was complete. This was shortly before the resignation of Estrup in 1894. But the fluctuations of parliamentary life in Denmark was not yet complete. The dispute indeed seemed interminable. The Landsthing and the ministry stood on one side, a majority of the Folkething on the other. This majority in the lower house gradually completed the rupture which had been threatened during the debates on land defences, and seemed at last rent asunder permanently into Radicals and Moderates. In August, 1899, M. Hörring became premier. The Radicals had been gathering strength since the retirement of Estrup, and the absence of his firm hand and clear judgment had imperilled the tranquillity of the political voyage in Denmark. In 1900, however, the new Conservatives rallied their strength, and a cabinet was formed by one of their number, M. Schösted, who, after a stormy experience, resigned in 1902, when the Radicals won an overwhelming victory at the polls and a Radical administration, under Prof. Deuntzer, came into power. After the elections of September, 1902, the Landsthing contained 29 Conservatives, 22 Independent Conservatives, 25 Radicals, and 1 Socialist. The ranks of the Independent Conservatives are largely recruited from the Radicals.

The prosperity of Denmark has greatly advanced since its dismemberment in 1864, and the increase in its trade has been remarkable. In 1898, the merchant steam fleet had an addition of 50,000 tons, in the shape of forty-nine individual ships. These form a part of the great tramp fleet that plies between Europe and America. The trade between Denmark and the United States has especially shown a healthy growth, the imports from the United States to Denmark for 1901 being over $21,00,000, while the United States imported from that country goods to the value of more than $2,000,000. This growth of trade between the two countries has been rapid, for the route from Copenhagen to Newport News and Norfolk, Va., was only opened up in 1898. The six Danish steamers engaged on this route also run to New Orleans and carry American goods to all the principal Baltic ports. The New York route has two large steamers newly built in 1898. The Danes emigrate in considerable numbers to the United States and generally settle in the agricultural districts of the west, notably in Illinois. Recent census returns give the annual Danish immigration as about 4,000. Agriculture has been developed in the peninsula to a remarkable degree during the past few years, and dairy produce manufactured with the aid of steam machinery has shown a proportionate increase. There are about 900 steam dairies in Denmark. The sanitary precautions taken by government in the inspection of cattle are more thorough than anywhere else in the world.

The Danish West Indian possessions have recently been looked upon as likely to become territories of the United States. These comprise St. Croix, the largest of the Virgin Islands, St. Thomas, a smaller island further south, and St. John, to the east of St. Thomas. Their united area is 118 square miles. The proximity of these islands to Porto Rico naturally points to their ultimate annexation and their importance as stations in the trade routes of the Caribbean Sea adds to their desirability as United States possessions. There has been for many years a willingness expressed by Denmark to transfer these islands, and the question was brought up afresh in 1902, when a treaty, providing for the sale of the Danish West Indies to the United States for $5,000,000, was signed at Washington by President Roosevelt, 14 January, and ratified by the Senate, 17 February. This was considered to have settled the question finally, but 23 April of the same year the Danish Landsthing passed a resolution postponing a decision as to the sale, until the electors qualified to send members to the Colonial Council should be consulted. The sale was not to be ratified until these electors should approve the cession. The Folkething went even further than this, and refused to ratify the sale, unless the inhabitants of the islands, who are mostly free negroes engaged in the cultivation of the sugar cane and number 35,156, declared in favor of the transfer by a plebiscite. The matter was thus naturally referred once more to the Landsthing, and when the matter came before that body (22 October) their decision was regarded as adverse to the bill. As the Premier reminded the Council, it would be necessary to put out more capital in the islands unless they were sold, and accordingly the West Indian Co., with a capital of $1,000,000, was formed at Copenhagen three days after the decision of the Landsgrath. The object of this company is to promote Danish trade with the Danish West Indies. Trade between Denmark and these three islands had been steadily decreasing for some years, and the Danish government in 1902 appointed a commission to proceed to the islands and report on measures for improving their commercial condition.

Danish Language and Literature.—The Danish language has sprung from the southeastern or Danish-Swedish branch of the *dönsk tunga* (or *lingua danica*), which was the common name by which the language of all the Scandinavians was designated in the Middle Ages by the southern races of the Teutonic stock. From the 11th to the 13th century the Danish-Swedish branch of the Old Scandinavian became more and more markedly distinct from the Norwegian-Icelandic branch, through its replacing the old diphthongs with single long vowels, and dropping the initial *h* before *l, n,* and *r;* while the latter became characterized by a further modification of the *a* sound, by the loss of *v* before *r,* and by a series of contractions of consonants. In the provincial laws of the 12th and 13th centuries, which (after the Runic monuments) are the earliest specimens of this Danish-Swedish language, there are three dialects — that of Skaane (the southmost province of Sweden) and those of Zealand and Jutland, the first of which is nearest the old language, while the last two have deviated from it by dropping the final consonants from the old inflexional endings and changing their vowels *a, i, u* to a less distinct *e* or *æ,* retaining, however, the hard mutes *p, k, t* after vowels, as on the whole is still the case in Swedish and spoken Norwegian. The dialect of Zealand in the 14th and 15th centuries forms the foundation of modern Danish. The original vowels in almost all endings are there replaced by half-vowels and the dental aspirate þ by *t* or *d; p, k, t,* when following long vowels, are changed to *b, g, d;* masculine and feminine are merged in one common gender; nouns have no other case-ending than the possessive *s* for both numbers; verbs cease to indicate person (except in the imperative); and the singular number begins to supersede the plural, as it does everywhere in the spoken language from the 16th century. Danish, like Swedish, retains the suffixed definite article, which is characteristic of the Scandinavian languages. Its form is *-et* in the neuter, *-en* in the common gender, and *-ne* in the plural of both.

The influence of the Hanseatic League and the Oldenburg dynasty (from 1448) brought in a great number of Low-German words, especially relating to navigation and trade; while that of the order of St. Bridget contributed a considerable Swedish element. In the first half of the 16th century the Danish language was chiefly used by religious writers, and the translation of the Bible (1550) is the first important monument of modern Danish. After this period Latin became once more the language of learning and culture, and for a century and a half there was no Danish writer of eminence. The influence of French was predominant in the 17th century, and that of High-German, which had been constant since the Reformation, culminated in the 18th century under the Struensee administration, when it was the language of government and public instruction. The result is, that Danish is indebted to German for fully one third of its vocabulary. It was not till Holberg that the Danish written language began to be enriched from the stores of native expression in the spoken tongue. From the end of the 18th century revived study of Old Scandinavian and the development of a national poetic literature unfolded the language in a hitherto unsuspected richness and fulness, and since that time Danish prose has to a considerable extent worked itself out of its poverty and dependence. Danish is the softest of the Scandinavian languages, though less euphonious than Swedish. It is the language of the educated class in Norway, where it is considerably augmented from the native dialect, and is spoken with a somewhat harder pronunciation. The best histories of the language are by Petersen (2 vols. Copenhagen, 1829–30) and Molbech (*ib.* 1846); grammars by Rask 2d ed. Lond. (1846), Lökke, Munch, Lyngby, Jessen, and Möbius (Kiel, 1871); and dictionaries by the Danish Academy (Copenhagen, 1793–1881), and Molbech (2d ed. 2 vols. *ib.* 1859), who also produced a 'Dansk-Dialekt-Lexikon' (*ib.* 1841) and a 'Dansk Glossarium' (*ib.* 1853–66) for antiquated words. Ferrall, Repp, and Rosing's 'Danish and English Dictionary,' in 2 parts (4th ed. Copenhagen, 1873), is the best for English students.

Literature.—After the Danish dialect had gradually separated itself from the Old Scandinavian as a softer and simpler speech, with a strong infusion of German ingredients, it was little used in writing down to the time of the Reformation. Saxo Grammaticus (that is, "the learned") in the second half of the 12th century wrote in Latin his 'Historia Danica,' the only literary production of mediæval Denmark that retains any interest. The earliest writings in Danish are the church laws of Skaane (1162) and Zealand (1170), and the civil laws of Skaane (1160), Zealand (1170), and Jutland (1241); and after these a number of chronicles, partly in verse, of which the best known is the 'Riimkrönike,' which was the first Danish book printed (in 1495). It is essentially an abridgment of Saxon. The famous Danish ballads called *Kæmpeviser* ("hero-songs"), some of which are said to belong to the latter part of the 11th century, were handed down orally from generation to generation, and were first collected, to the number of 100, by A. S. Vedel in 1591. In 1695 Peder Syv published a new edition with 100 more, and in 1812–14 appeared a selection of 222, edited by Abrahamson, Nyerup, and Rahbek. The most complete collection is in Svend Grundtvig's unfinished 'Gamle Folkeviser' (5 vols. 1853–77). They are about 500 in number, and treat of the adventures of heroes, love, enchantment, spectres, and historical events. Doubtless they were sung to the dance, as is still the case in the Färöe Islands. They must have suffered much by their not being written down till the 16th and 17th centuries.

The Reformation only emancipated Danish culture from Latin to bind it fast to German, which at the death of Frederick I. in 1533 was the language of the upper classes. About that time Christian Pedersen set up a printing-press at Malmö, at which he published a great number of popular books, and finally in 1550 the first complete translation of the Bible. Pedersen (1480–1554) is justly called the father of Danish literature. The hymns and translations of the Psalms by his contemporary Tausen (1494–1561), as also by Kingo (1634–1703), Vormondsen (1491–1551), and Arrebo (1587–1637), and the national history (10 vols. Copenhagen, 1595–1604) of Hvitfeld (1549–1609) were well received; but the Danish language was still banished from higher society till the advent of the Norwegian Holberg (1684–1754), the founder of Danish comedy. He found Denmark on the point of being absorbed in Germany. "The common peo-

ple," he says, "had no histories but dry lists of dates; no poetry but congratulatory verses; no theology but homilies and funeral sermons; and for plays, nothing but old stories about Adam and Eve." He wrote histories of Denmark, of the Jews, and of the Church; and the irresistible humor of his comedies and satires covered with ridicule the imitators of foreign speech and manners. What Holberg did for Danish prose, another Norwegian, Tullin (1728–65), did for Danish poetry. Equally dissatisfied with the current imitations of the 17th century court poetry of France, and with the poetic reform of Klopstock (at Copenhagen from 1751), Tullin followed the guidance of the English poets Pope, Young, and Thomson, and in this was followed by most of his countrymen who were settled at Copenhagen, while the Danes clung to German models. Ewald (1743–81), an ardent disciple of Klopstock, was Denmark's first great lyric poet and tragic dramatist. His verse shows an unsurpassed mastery of form, and is expressed in pure, clear, and noble language. Wessel (1742–85), by his "tragedy," 'Love without Stockings' (1772), a humorous parody of the Danish imitations of the classical French drama, succeeded in laughing them off the stage. Nordahl Brun (1745–1816), preacher and poet, Claus Frimann (1746–1829), "The Burns of the Norwegians," Claus Fasting (1746–91), Jonas Rein (1760–1821), Jens Zetlitz (1761–1821), and others, formed themselves (1772) into a "Norwegian Society" at Copenhagen, under the leadership of Wessel. It was the literary manifestation of the Norwegian aspiration to separate nationality, which afterward led to the foundation of the university of Christiania in 1811. From the death of Wessel in 1785 to the beginning of the present century the literature became entangled in rationalistic and political polemics, and produced little that is noteworthy. Its chief writers were P. A. Heiberg (1758–1841) and Malte Konrad Brun (1775–1826), both of whom were driven into exile in 1799–1800, the latter afterward famous as a geographer; the critic Rahbek (1760–1830); the dramatists Samsö (1759–96) and Sander (1756–1819); and the lyrist Thaarup (1749–1821).

The poet and humorist Baggesen (1764–1826) forms the link between the 18th century and the early part of the 19th, when Danish literature took an entirely new departure, partly owing to the study of Kant, Fichte, and Schelling, and the influence of Schelling's follower Steffens (1773–1845); partly also to the strict censorship of the press in force from the year 1799. The educated classes turned from their controversies on points of literary criticism and theology to scientific inquiry; and the people, whose national feeling had been aroused by the French Revolution, by the share of Denmark in the Napoleonic wars, and especially by the events of 1801 and 1807, the war with Sweden (1808), and the loss of Norway (1814), welcomed with enthusiasm the rise of a new school, led by the romantic poet Oehlenschlager (1779–1850), who was equally distinguished as a lyrical and dramatic writer, and is still regarded by many as the greatest Danish poet. Contemporary with him were the poets Schack-Staffeldt (1769–1826) and Grundtvig (1783–1872), afterward more eminent as a theologian; Ingemann (1789–1862), long the most popular novelist of Denmark; J. L. Heiberg (1791–1860), director of the royal theatre at Copenhagen, writer of numerous vaudevilles, and of the still popular national play 'Elves' Hill' (1828); Hauch (1791–1872), dramatist, novelist, and critic; and Blicher (1782–1848), who in his tales of Jutland was the first worker in the field which has since been cultivated in Germany by Jeremias Gotthelf and Berthold Auerbach. Of the other novelists of this period the chief are Brosboll (b. 1820); Fru Gyllembourg-Ehrensvard (1773–1856), mother of J. L. Heiberg; Saint-Aubain, or "Karl Bernhard" (1798–1805); and the still more popular Winther (1790–1870), the charming poet of Danish country life Herz (1798–1870), from the time when his 'Ghost Letters' (1830) surprised the public with a poetic revival of the muse of Baggesen, has, now with his lyric poems, now with his tales, now in romantic and national tragedies, now in comedies and light vaudevilles, provided his countrymen with artistic and attractive works. Overskou (1798–1874) is a skilful dramatist, and Hostrup (1818–92) a popular author of comedies. All these writers are surpassed by Hans Christian Andersen (1805–75), whose wonderful stories are known throughout the civilized world. Less popular, but more profound, was the versatile writer Fr. Paludan-Müller (1809–76), who from his play 'Love at Court' (1832) to his great epic poem 'Adam Homo' (1841–48) has wooed all the muses in succession. Here may be mentioned Bergsöe (b. 1835), writer of novels and popular works on scientific subjects; Goldschmidt (1819–87), editor of the influential Democratic journals, 'The Corsair,' 'North and South,' and 'Home and Abroad,' and afterward author of numerous romances; Holst (1811–93), a writer of pleasing lyrics and tales; Kaalund (1818–85), with his two collections of poems 'A Spring' and 'An Autumn'; the erotic and piquant and sometimes frivolous song-writer Aarestrup (1800–56); and Lembcke (b. 1815), the translator of Shakespeare.

A great impulse was given to all branches of science from the beginning of the 19th century. The leading theologians were Grundtvig, the enthusiastic champion of the faith of his fathers against rationalism, and advocate of a union of the Scandinavian kingdoms, but with the Church separated from the state; Mynster (1775–1850), Bishop of Zealand; Clausen (1793–1877), the disciple of Schleiermacher, and theological opponent of Grundtvig; Martensen (1808–84), Bishop of Zealand, and author of standard works on systematic theology and ethics; and Kierkegaard (1813–55), the most original thinker of Denmark. The chief exponents of philosophy were Sibbern (1785–1872), Nielsen (b. 1809), and Bröchner (1820–76); and in natural science the greatest names were those of Oersted (1777–1851), the discoverer of electro-magnetism, the botanist Schouw (1789–1852), the geologist and chemist Forchhammer (1794–1864), and the zoologist and archæologist Steenstrup (b. 1813). Much has been done for the study of Scandinavian antiquity by the 'Sagabibliothek' of Müller (1776–1834), and the researches of Finn Magnusson (1791–1846) in mythology, and of Thomsen (1785–1865) and Worsaae (1821–85) in archæology. The chief 19th-century writers of national history have been Werlauff (1781–1871), Molbech (1783–1857), Allen (1811–77), Schiern (b. 1816), and K. P. Paludan-Müller (1805–82); and of the history of the national literature and language, Petersen (1781–1862). In philology,

Rask (1787–1831) and Madvig (1804–86) have a European fame.

About 1850 the enthusiasm for the national past, which had been excited by Oehlenschläger in Denmark, and by Tegnér, Geijer, and others in Sweden, together with the hatred of Germany aroused by the war of 1848–50, rose to a pitch of fanaticism. "The northern force which had controlled the world" was extolled by Ploug and others as "the only means whereby the victory of the Cause of Humanity could be achieved." After Ploug (b. 1813) the chief exponents of this great historic mission of the northern kingdoms were C. K. F. Molbech (1821–88) a euphonious lyrist and skilful dramatist, and translator of Dante; and Erik Bögh (b. 1822), a fertile writer of *feuilletons* and adapter of plays. A cosmopolitan reaction set in about 1870, led by Georg Brandes (b. 1842), who proved in his lectures on literature that Denmark was only a side-chapel in the temple of European thought and art, and that this overstrained "Scandinavianism" was but the northern phase of the reaction from the tendencies of the 18th century, which had been experienced in England, France and Germany many years before. Brandes withdrew to Berlin for some years from the storm of popular opposition. Not only in Denmark, but in Norway and Sweden also, his followers are now the prevailing party. The most conspicuous of these have been Jacobsen (1847-85), the translator and adherent of Darwin, and author of 'Mogens' (1872) and other novels; and (till in 1883 he became a Conservative) Drachmann (b. 1846). Of recent writers, the most noteworthy are Schandorph (b. 1836), who is equally happy in his sketches of the Zealand peasant and the Copenhagen snob; the versatile writer Hermann Bang (b. 1858); and the dramatist Edvard Brandes (b. 1847), brother of Georg Brandes.

Of the three Scandinavian nations, the Danes have shown the greatest aptitude for the imitative arts, and their art is comparatively the most independent. While the painters of Norway have been mostly trained at Düsseldorf, and those of Sweden at Paris, the artists of Denmark have been especially attracted to Rome. The sculptor Thorwaldsen (q.v.) has left a great monument of his genius in the works contained in the Thorwaldsen Museum at Copenhagen. Of later artists may be mentioned the painters Marstrand, Carl Bloch, Exner, Kroyers, Henningsen, and Otto Bache. Of music, the chief composers in the 19th century have been Hartmann, Gade, and Heise.

Kraft, 'Almindeligt Litteraturlexikon for Danmark, Norge og Island' (Copenhagen, 1818–20); Peterson, 'Den danske Literaturs Historie', 6 vols. (1853-64); Overskou, 'Den danske Skueplads i dens Historie' (1859–74); G. Brandes, 'Ludwig Holberg og hans Tid' (1884); the general treatises in Danish by Thortsen (1814; 6th ed. 1866), Heiberg (1831), Molbech (1839), Strom (1871), Erikson (Christiania, 1878), Winkel-Horn (1880), and Hansen (1884 et seq.); and in German by Strodtmann (1873), Wollheim de Fonseca (1874-77), and Winkel-Horn (1880); Gosse 'Studies in the Literature of Northern Europe' (1879); Anderson, 'History of the Scandinavian North' and 'Norse Mythology'.

Denne-Baron, Pierre Jacques René, pē-ār zhäk rė-nā dān bä-rôṅ, French poet and essayist: b. Paris 6 Sept. 1780; d. there 5 June 1854. He had much learning and a faultless taste; 'Hero and Leander' (1806); and 'Poetic Flowers' (1825) being delightful though not great, while his 'Dictionary of Conversation' is widely known.

Den'ner, Balthazar, German portrait painter: b. Altona 15 Nov. 1685; d. Rostock 14 April 1749. He was painter to several courts, executing portraits of princes and dignitaries, and was noted for his extraordinary minuteness of finish. Among his works are: 'Head of an Old Woman'; for which Charles VI. paid 4,700 florins; and 'Head of an Old Man,' both in the Vienna Museum; and many canvases in other famous galleries.

Dennery, Adolphe Phillipe. See ENNERY, ADOLPHE PHILLIPE DE.

Dennewitz, dĕn'nē-vĭts, Germany, village in the province of Brandenburg, Prussia, famous for the battle between the French and Prussians, 6 Sept. 1813, the former commanded by Ney (under whom were Oudinot, Bertrand, Reynier, and Arrighi), the latter by Tauenzien and Bülow. Forty thousand Prussians maintained their ground for several hours against 80,000 French; and on the arrival of the Russian and Swedish battalions victory declared in favor of the allies, who, after the Russians and Swedes came up, were far superior in numbers. The French were defeated, and fled in disorder.

Dennie, Joseph, American journalist: b. Boston 30 Aug. 1768; d. Philadelphia 7 Jan. 1812. He published 'The Farrago' (1795), essays on life and literature. From 1796 to 1798 he edited with great success the 'Farmer's Weekly Museum' at Walpole, N. H. In this appeared his essays signed "The Lay Preacher," whose droll and easy style made him popular. In Philadelphia (1801), assisted by Asbury Dickens, he founded the 'Portfolio,' which he edited till his death under the pen-name of "Oliver Old-School." Two collections of his writings have been published: 'The Lay Preacher, or Short Sermons for Idle Readers' (1796); and 'The Lay Preacher' (1817).

Dennis, John, English dramatist and critic: b. London 1657; d. 6 Jan. 1734. In 1697 he produced a comedy entitled 'Plot and No Plot,' which was followed by several dramatic pieces and poems of little value. He also became a political writer for the Whig party. The irritability of his disposition, heightened probably by the unprosperous state of his finances, involved him in perpetual broils, and made him a sort of standing jest with the wits of his time. He wrote some severe strictures on Addison's 'Cato' and Pope's 'Rape of the Lock.' Pope in return gave him a place in the 'Dunciad,' and in conjunction with Swift produced a sarcastic tract entitled 'A Narrative of the Deplorable Frenzy of Mr. John Dennis.' In his old age his necessities were relieved by a benefit at the Haymarket Theatre, to which his former antagonist, Pope, contributed a prologue.

Dennis, Robert, English journalist: b. Bodmin, Cornwall, 5 Jan. 1855. He was educated at Leipsic, was for a time reporter and

assistant editor on the *Mail* and Glasgow *News*, and then, removing to London, served on the staff of various London papers, and has been news editor of the London *Daily Express* from its foundation. He has published 'Industrial Ireland' (1887); 'History of the Baronetage' (1887); 'The New Politics' (1898); 'A Romance of Tottenham' (1899).

Dennison, William, American statesman: b. Cincinnati, Ohio, 23 Nov. 1815; d. Columbus, Ohio, 15 June 1882. He was graduated at Miami in 1835 and became a lawyer, being elected to the Ohio legislature in 1848. He became governor of Ohio in 1860, and rendered invaluable aid to the Union cause throughout the Civil War. President Lincoln appointed him postmaster-general in 1864, an office he retained under President Johnson, resigning in 1866. Dennison College owes much to his liberality.

Denon, Dominique Vivant, dō-mē-nēk vē-vaṅ dē-nôn, BARON DE, French artist, diplomatist, and author: b. Châlons-sur-Saône 4 Feb. 1747; d. Paris 27 April 1825. He was attached to embassies at St. Petersburg, Switzerland, and Naples, successively. Becoming acquainted with Bonaparte, he accompanied the general in his campaigns to Italy and Egypt, and Desaix to Upper Egypt. The work which was the result of this journey, 'Voyage dans la Basse et la Haute Egypte,' was issued in 1802. When he returned to Paris with Bonaparte he was appointed inspector-general of the museums and all the works of art executed in honor of the French successes — monuments, coins, the erection of the triumphal pillar in the Place de Vendôme, etc. He accompanied Napoleon in all his campaigns, and employed himself in drawing and in selecting those masterpieces in the conquered countries, which were taken to Paris as trophies. After the abdication of the emperor he retained his office, but was deprived of it in 1815, in consequence of having joined Napoleon on his return from Elba. He retained, however, his place in the Institute. From that time he lived retired, and the preparation of engravings and lithographs of his splendid collection of works of art formed the occupation of his last years. In 1826 appeared at Paris the 'Description des Objets d'Art Composant le Cabinet de feu M. le Bar. V. Denon.'

Dens, Petrus, author of a manual of Catholic theology: b. Boom, Belgium 1690; d. Mechlin 15 Feb. 1775. He is noteworthy only as author of a manual text-book of Catholic theology, 'Theologia Moralis et Dogmatica' (Moral and Dogmatic Theology). This work, which, it seems, was used as a text-book in the ecclesiastical college of Maynooth in Ireland, happening to come under notice of some zealous opponents of the Roman Catholic Church, was translated (in whole or in certain parts) and published at Dublin in 1832 in the interest of anti-popery. The so-called incriminating passages in the work do not differ essentially from corresponding portions of other treatises on the same subjects used in Catholic schools of theology. The author of the treatise was a professor in the diocesan seminary of Mechlin and during 40 years was president of the institution. He was also honored with several offices of importance in the diocese of Mechlin — Canon Penitentiary, synodical examiner, archpriest of the Metropolitan Cathedral of Belgium, and other offices.

Densimeter, an instrument invented by Colonel Mallet of the French army, and M. Bianchi, for ascertaining the specific gravity of gunpowder. It consists of a glass globe having a tube which communicates with a quantity of mercury in an open vessel. The globe is joined at top to a graduated glass tube, which may, by means of a flexible tube, be connected with an air-pump. A diaphragm of chamois skin fits over the lower, and one of wire-cloth over the upper orifice of the globe, and the tubes above and below those orifices are provided with stop-cocks. For ascertaining the density of the gunpowder, the air is exhausted from the globe by means of the air-pump, until the mercury rises to a certain mark on the graduated tube when the globe is detached from its support and weighed. It is then emptied and cleaned, and a given weight of gunpowder introduced, when it is again attached to the tubes and the air exhausted as before, filling with mercury all the space in the globe not occupied by the powder, up to the mark before indicated. The stop-cocks are now closed, and the globe once more detached and weighed. The absolute specific gravity of the powder is obtained by multiplying the weight of the powder contained in the globe by the known specific gravity of mercury, and dividing the product by the product resulting from multiplying the difference between the weight of the globe when filled with mercury alone, and its weight when filled with mercury and powder, by the weight of the powder employed in the experiment.

Density, a term denoting the quantity of matter per unit of volume in a body. A cubic inch of lead is considered to contain a greater quantity of matter than a cubic inch of wood, and lead is thus said to be more dense than wood. Mass or quantity of matter is measured by its inertia, according to Newton's celebrated "laws of motion"; or, since Newton has shown experimentally that gravity and inertia are proportional, the mass of a body is measured by its weight. A comparison of the weights of equal bulks of various bodies results therefore in a comparison of their densities. In order to test the densities of various bodies conveniently, a standard substance is fixed on, and the densities of other substances are reckoned by comparison with this. For all liquids and solids, water at a fixed temperature is taken as the standard; and for all gases the standard is common air at a fixed temperature and barometric pressure. There is however some variation in the temperature fixed on, in the first case, and in both the temperature and pressure fixed on in the second. Thus in England the standard temperature for water used to be 60° F. and sometimes 62° F. The latter temperature is mentioned in the legal definition of the imperial gallon. Again, in the case of gases the standard temperature was 60° F. or 62° F., and the standard pressure 30 inches of mercury in the latitude of London.

The metric system on the other hand, makes use of the temperature 4.1° C. (the temperature of the maximum density of water) as the standard for water, and of the pressure 76 centimeters of mercury in latitude 45° as the standard barometric pressure. For gases the temperature

0° C. (the melting point of ice) is always employed as the standard. See GRAVITY, SPECIFIC.

Density of the Earth.—The determination of the density of the earth as compared with that of water or any other known body, is a subject which has excited considerable interest among modern mathematicians; and nothing can, at first sight, seem more beyond the reach of human science than the due solution of this problem; yet it has been solved and on such principles that, if it be not exactly correct, it is probably an extremely near approximation. The first idea of determining the density of the earth was suggested by M. Bouguer, in consequence of the attraction of Chimborazo, which affected his plumb-line while he was engaged with Condamine in measuring a degree of the meridian near Quito, Peru. This led to the experiments on the Schehallien Mountain, in Scotland, which were carried on under the direction of Dr. Maskelyne, and afterward submitted to calculation by Dr. Hutton, who determined the density of the earth to be to that of water as 4½ to 1. But in consequence of the specific gravity of the mountain being assumed rather less than it ought to have been, the above result is less than the true density, as has since been shown by Dr. Hutton and Professor Playfair, the former of whom makes it, in his corrected paper, as 99 to 20 or nearly as 5 to 1. The same problem was attempted on similar principles, but in a totally different manner by Henry Cavendish who found the density of the earth to be to that of water as 5.48 to 1. Taking a mean of all these we have the density of the earth to that of water as 5.24 to 1. Two calculations made on quite different principles by two physicists in 1899 showed the surprisingly similar results of 5.5270 and 5.5273.

Den'slow, William Wallace, American illustrator: b. Philadelphia 5 May 1856. He studied art at Cooper Institute and at the National Academy of Design, New York. He has been a prolific illustrator since 1872, at first being a traveling illustrator for the leading American newspapers. Among his works are the pictures: 'What's the Use?' 'Victory,' and 'The Heathen Chinee.'

Dent, Frederick Tracy, American soldier: b. White Haven, Mo., 17 Dec. 1820; d. Denver, Col., 24 Dec. 1892. He was graduated from the United States Military Academy at West Point in 1843, and served in the Mexican war, being engaged in the siege of Vera Cruz, and the battles of Churubusco and Molino del Rey. He took part in the Yakima expedition (1856), in the Spokane expedition, and in the Snake River expedition (1860). During the Civil War he commanded a regiment in the Army of the Potomac in 1863; was stationed in New York in September 1863, where riots were feared, and was Grant's aide-de-camp throughout the Richmond campaign. He was secretary to President Grant during his first administration. He retired from active service in 1881, with the rank of brigadier-general in the regular army.

Dental Formula. See TEETH.

Dental Schools. The Baltimore College of Dental Surgery, established 1839, was the first institution of the kind in the world. Other schools in the United States are: Ohio College of Dental Surgery (1845); Pennsylvania College of Dental Surgery (1856); Philadelphia Dental College (1863); New York College of Dentistry (1865); and dental departments at Harvard since 1867, University of Michigan since 1875, and University of Pennsylvania since 1878.

Dental Societies. In 1840 the American Society of Dental Surgeons, the pioneer of the associations to which dentistry owes so much of its progress, was organized in New York. The National Association of Dental Faculties, organized in 1884, has done much to strengthen courses of study in dental schools. At the time of its organization only those schools were admitted which had proper facilities for instruction and a corps of competent teachers. From time to time standards have been raised by rules governing attendance, instruction, and graduation. There are at present 47 schools in the association, all of which require three full courses of dental lectures. The National Association of Dental Examiners was organized in 1883 to secure higher and more uniform standards for admission to dental practice.

Denta'lium, a genus of mollusks of the class *Scaphopoda,* the shell of which consists of a tubular arcuated cone open at both ends, and resembling the tusk of an elephant in miniature. They bury themselves in the sand, and capture their food, which mainly consists of foraminifers, by means of their tentacles. *Dentalium* is one of the three genera constituting the small class *Scaphopoda.* There are many species, known by the common name of tooth-shells. *D. elephantinum* occurs off the British coasts.

Denta'ria, pepper-root, a genus of plants of the natural order *Cruciferæ.* There are about 15 species, natives of temperate countries, of which 11 are found in America. They are ornamental herbs, with creeping singularly toothed root-stocks, from which they receive the names of pepper-root and toothwort. The stem-leaves are opposite or in whorls of three, and the flowers are white or pink. The American species extend from Nova Scotia to Florida and west to Minnesota and Louisiana. The best-known is the pepper-root, crinkle-root, or toothwort (*D. laciniata*). The common names refer to the pungent and tooth-like divisions of the root, which is, in some localities, ground and used like horse-radish.

Denta'tus, Manius, or **Marcus, Curius,** Roman statesman, flourished in the first half of the 3d century B.C. His first office was tribune of the people, in which he distinguished himself by his opposition to Appius Claudius Cæcus, who, in defiance of law, refused to receive any votes for plebeian candidates. In 290 B.C. he was consul with P. Cornelius Rufinus, and by his decisive victories over the Samnites terminated a war which had lasted for 49 years. In 275 B.C. he was again consul, and near Beneventum defeated King Pyrrhus. The triumph which followed was one of the most magnificent which had ever been witnessed, and was remarkable for the presence of four elephants, which were then seen for the first time in the streets of Rome. In 274 B.C. he was a third time consul, and after terminating the war with the Lucanians, Samnites, and Bruttians, retired to his Sabine farm and spent the remainder of his life in cultivating it.

Den'tex, a genus of acanthopterous fishes near perches. One species (*D. vulgaris*), the *Dentex* of the ancient Romans, abounds in the Mediterranean, and has occasionally been taken on the southern shores of Great Britain. It is voracious, and has large, sharp teeth. It is sometimes seen three feet in length, and 20 to 30 pounds in weight. Great numbers are taken in the mouths of rivers in Dalmatia and the Levant, where they are cut in pieces, and packed in barrels with vinegar and spices, just as the ancients used to treat them.

Den'tifrice (Lat. *dentifricium*, a tooth-powder, *dens*, tooth, *fricare*, to rub), any preparation, liquid or powder, for the purpose of cleaning the teeth. Chalk, precipitated, is generally the base of most of the dentifrices on the market. For detergents, charcoal, cuttlefish-bone or pumice are sometimes incorporated with the milder principle. Bleaching salts and acids find their way in many market preparations, constituting a grave danger to the tooth structure. A few drops of any of the standard antiseptics added to water will often prove an efficient cleanser aided by the friction of the brush.

Den'tils, in architecture, the little cubes or small squarish blocks resembling teeth, into which the square member in the bed-molding of an Ionic Corinthian, composite and occasionally a Roman Doric cornice is divided. Their breadth should be half their height, and the metoche (interval) between them two thirds of their breadth.

Dentin, or **Dentine**, dĕn'tĭn, the bone-like structure constituting the body of a tooth, which in the crown portion is covered by enamel and in the root portion by the *crusta petrosa* or cementum. See TEETH.

Dentistry is a special department of the science and art of healing; embracing a knowledge of the structure, physiology, and pathology, and the therapeutic, surgical, and mechanical treatment of the tissues of the mouth and its contained organs, also a knowledge of the materials used and their manipulation in the restoration of the dental and oral structures.

Operations upon the teeth for relief from distress caused by diseases and accidents to which they are subject were doubtless performed concurrently with man's first efforts to relieve his other bodily ills. Dentistry as a distinct vocation is first alluded to in the writings of Herodotus (500 B.C.), but evidences of a much earlier practice are furnished by Egyptian and Hindu records and by the teeth in the crania of some of the earlier aboriginal races. The early Greeks and Romans were evidently familiar to some degree with dental art, for in the celebrated laws of the 'Twelve Tables' (450 B.C.) we find reference thereto in the Tenth Table, as follows: *Neve aurum addito: cui auro dentes juncti escunt, ast im cum illo sepelict, uretve se fraude esto.* "If anyone's teeth have been bound together with gold it shall not be unlawful to bury him with it." It is probable that the Romans derived their knowledge of dental art from the Etruscans, who in turn derived theirs from the Egyptians, the fountain-head of the arts and sciences. Of the growth of dental art from the time of Hippocrates until the Christian Era but little is recorded, and even thereafter, until the 17th century, such advances as were made in a knowledge of the teeth were largely in relation to their structure and functions, but the recorded observations were much influenced by the superstition and ignorance of the time, and are consequently of but little value. The observations of Antoni van Leeuwenhoek of Delft, Holland, on the anatomy of the teeth, published in 1678, contained an account of his discovery of the tubular structure of the dentin — a discovery made possible by the aid of a crude form of microscope which the author had invented. Up to this period operations upon the teeth were largely practised by surgeons and not infrequently by barbers, and were limited principally to extraction and the treatment of toothache and abscesses or inflammatory disorders of the soft tissues surrounding the teeth. The restoration of teeth by mechanical means and the filling of cavities caused by decay of their structure called for a type of skill which the training of the surgeon and physician did not furnish, hence there was developed from the crafts of the artisan, the goldsmith and the workers in precious metals, the dental mechanic, whose skill enabled him to devise and fashion the substitutes for lost dental organs, an art which later, as a result of systematic study and organized professional training, has developed a high degree of perfection.

The development of modern dentistry as a professional calling has had a distinctly double origin: first, as an outgrowth of medicine and surgery, certain practitioners of these arts in the earlier days devoting themselves to dental practice and adding to their medical qualifications such technical and manipulative skill as enabled them to meet the public demand for restorative operations upon the teeth; second, the artisan or mechanic dentist who acquired so much of medical and surgical knowledge as enabled him to treat with some measure of success the dental diseases with which his calling confronted him. In England at the beginning of the 19th century the best practitioners of dentistry were medically educated men, of whom Joseph Fox, lecturer on diseases of the teeth at Guy's Hospital, London, may be taken as the type. Both Fox and his successor, Thomas Bell, published works on diseases of the teeth which for their time were standards. The works of other British writers on the same subject, notably those of Koecker, Jobson, Waite, and Alexander Nasmyth, all made their appearance in the first half of the 19th century. The works of these English practitioners and teachers were characteristic of the medically and surgically educated practitioners in that the anatomical, pathological, and therapeutic departments of dental science and practice were strongly emphasized by them, while the manipulative phase and restorative department of dental art were given a minimal recognition.

Of the earliest origin of the art of mechanically restoring lost dental structures the records are obscure. Jaws in which natural teeth or carved imitations of them were inserted and retained by means of gold bands affixed to adjoining sound teeth have been found in early Etruscan tombs — specimens of this character being preserved in the museum of Pope Julius in Rome and elsewhere. Specimens of similar restorations are also recorded as having been found in the mouths of Egyptian mummies. No rec-

ord, however, of a systematic presentation of this department of dental art is known to have been published until the work of Pierre Fauchard made its appearance in France (1728). This treatise upon the art of dentistry was most complete for that period, and so great was its originality that its author has with much justice been called the "father of modern dentistry." Fauchard was born in Brittany (1680) and died in Paris (1761). In the preface to his book he makes the following interesting statement regarding the then existing status of dentistry: "The most celebrated surgeons having abandoned this branch of surgery, or at least having but little cultivated it, the negligence has been the cause of its being embraced by those who, without theory and without experience, practise it without principles or methods. It is only recently that in the city of Paris the eyes have been opened to this abuse, and an easy examination is required of those who devote themselves to the treatment of these diseases, after which they are granted the title of Experts upon the Teeth, although several among them are only provided with a knowledge below mediocre." As it was provided that the examination referred to should be conducted by "men learned in all branches of medical science" who should decide upon the merits of the applicant, we have in this measure the first recorded attempt at the statutory regulation of dental practice which is now a generally exercised safeguard to the public health in all nations. The work of Fauchard gave an impulse to the practice of dental art and tended to specialize it as a distinct calling; it was the art of Fauchard which was implanted upon American soil by the French dentist, Joseph Lemaire, a surgeon attached to the forces of Count Rochambeau, whose army was quartered with the Colonial troops near Providence, R. I., during the winter of 1781–2. Although Lemaire had been preceded in 1756 by one Robert Woofendale, a student of Thomas Berdmore, dentist to His Majesty King George III., and probably by one or two others of whom the records are obscure, the importance of Lemaire's visitation attaches to the fact that he took occasion to instruct in his art Josiah Flagg, a young man holding a major's commission in the Colonial army, and he thus educated the first dentist native to this country. Another who profited by Lemaire's instruction along with Josiah Flagg was James Gardette who arrived with the French fleet in the capacity of naval surgeon, but who through his interest in the work of Lemaire turned his attention to dentistry and after the close of the war went to Boston, thence to New York in 1783, and finally in the autumn of 1784 settled in Philadelphia, where he practised his profession as dentist until 1829, when he returned to France and died in Bordeaux (1831). The career of Gardette as a dental practitioner was remarkable not only from a financial standpoint, but by reason of the intelligence which he exercised in his calling and the ingenuity and skill which characterized his work. He added many useful improvements to dental art and attained much prominence as a skilled and ethical professional man.

Early in the 19th century several dentists who did much to elevate dental practice and place it upon a professional plane arrived in America from Europe. Edward Hudson, a native of Ireland, and Leonard Koecker, of Germany, both of whom practised in Philadelphia, were noted for their excellence as practitioners and their high professional standing. These early pioneers of American dentistry were practitioners *sui generis*. Their means of education and professional training were limited to what they could obtain from preceptors and the scanty literature of the time, but what they lacked in educational facilities was more than compensated by their natural ability and enthusiasm, and so excellent were the standards which they raised that much that is best in modern dentistry is to be justly credited to their almost unaided achievement and professional example. The success of the early practitioners and the increasing demand for dental service coincident with the growing population, brought about a corresponding increase in the number of those who offered their services to the community as dentists. There being no legal restrictions upon practice, anyone might advertise himself as a dentist regardless of his qualifications for the practice of that specialty, hence, tempted by the emoluments and position which dentistry seemed to offer, many incompetents engaged therein and charlatanism was rife. The only means of obtaining a practical knowledge of the art of dentistry was through the instruction of a preceptor who had similarly acquired it, hence the instruction of apprentices became a lucrative business, as large fees were charged for initiating the novice into the art and mystery of dental practice. The knowledge thus gained at considerable cost and having a commercial value was jealously guarded, and with but few exceptions professional intercourse among practitioners was an unknown feature. This deplorable condition of affairs becoming intolerable to those dentists of more liberal tendencies, an attempt was successfully made in New York in 1787 to organize a local association of dentists, and in 1840 in the same city a national association, the American Society of Dental Surgeons, was organized, mainly through the efforts of Dr. Horace H. Hayden of Baltimore, "to advance the science by free communication and interchange of sentiments."

The year previous to that which saw the creation of the American Society of Dental Surgeons the first dental journal in the world had been established through the instrumentality of Dr. Chapin A. Harris, who had enlisted a number of the more liberal and enthusiastic of his colleagues in the enterprise, and in 1840 the first college in the world for the systematic education of dentists, the Baltimore College of Dental Surgery, opened its first course of lectures and laboratory instruction in the science and art of dentistry. The charter for the institution, which is still in successful operation, was obtained from the legislature of Maryland by Drs. Harris, Hayden, and others. In the years 1839–40 there were thus established the three essential factors of professional growth in dentistry — the college, the association, and the journal. The establishment of these means of systematic dental education upon an independent basis with a separate organization for associated work among dental practitioners led to the growth of dentistry as a professional calling, distinct from medicine, although it is essentially a department of the science and art of

healing by virtue of the fact that it deals with the diseases of a most important part of the human organism, which have intimate vital relationships with the entire body, and for its successful practice demands as broad a knowledge of the fundamental medical sciences as that required by the practitioner of any other medical specialty.

The distinguishing factor of dental training, and one which is not required to the same degree in any other department of the healing art, is the manual skill and mechanical training needed for the successful practice of the prosthetic or restorative operations which the dentist is constantly called upon to perform. It was the lack of facilities in medical schools for obtaining the necessary training in the mechanical procedures of dental art that led to the establishment of the first dental college and placed dental education upon a basis independent of general medical education. The increase in knowledge of the diseases of the mouth and its contained organs and the growing recognition of the vital relationships of the oral tissues to the body as a whole, have gradually compelled the broadening of the dental educational curriculum until at present all of the fundamental medical sciences are included in the *curricula* of the best dental colleges, and upon this scientific foundation is erected the superstructure of technical education and manual training necessary to the art of the dentist.

The development of dentistry in America has been phenomenal, especially in all that pertains to its art side. The incorporation of the systematic teaching of mechanical dentistry in the college course instead of depending upon the uncertain educational results of the apprenticeship system has had greatly to do with creating a body of American practitioners skilled in their art. It is in fact for his skill as an operative dentist that the American practitioner has been mainly distinguished, while his contributions to the scientific basis of dentistry have been on the whole less voluminous than those of European practitioners, especially in the domain of original scientific research. The art of replacing lost portions of tooth crowns by gold fillings has had its greatest development in America, indeed as we know the operation to-day it may be said to have originated there. As originally practised the ideal gold filling was one which simply acted as a stopper inserted in a cavity produced by decay, for the purpose of excluding moisture and furnishing a surface sufficiently resistant to withstand the wear and tear of mastication. The filling was finished on a level with the cavity margins and no attempt was made to restore the lost contour of the tooth in imitation of its natural configuration. When, however, the discovery of the cohesive property of annealed gold foil was made and promulgated by Dr. Robert Arthur, of Baltimore, in 1855, the whole method of filling teeth with gold was revolutionized and complete artistic restoration of the normal configuration of the tooth by building with gold foil became the accepted ideal of practice. In connection with the general use of cohesive gold as a filling material certain ingenious and important devices came into existence as adjuncts to the operation of tooth-filling, having their origin in the necessities of the case. These were the dental engine, the mallet, and the rubber coffer-dam.

The operation of preparing the cavity for the reception of the gold involves the removal of decayed portions and frail margins, and giving to the cavity a retentive shape, so that the filling when inserted shall be solidly and immovably held in place. The early methods of cavity preparation were laboriously performed by small chisels and cutting instruments manipulated exclusively by the hand. Hand instruments were also exclusively used for the insertion and condensation of the gold foil in building the filling and subsequently giving it the required form and surface finish. The introduction of the dental engine run by foot-power, or as in its more recent modifications by electric motor, has not only greatly facilitated the operation of tooth-filling but has made possible more accurate and perfect results. So manifold have been the improvements made in the dental engine and its equipment of accessory appliances that it may, if the operator so desire, be used for every step of the operation from cavity preparation to the finished filling. As the cohesive property of gold, upon which its value in restoring the form of the tooth depends, is at once destroyed by contact with moisture, great difficulty was formerly experienced during large filling operations in excluding the gold from contact with saliva; napkins, bibulous paper and various mechanical devices were used for the purpose, but were often insufficient to prevent the destruction of a filling during the progress of its insertion. The device known as the rubber dam, introduced by Dr. S. C. Barnum of New York, about 1865, solved the problem of effectually excluding moisture from the teeth undergoing the filling operation and made possible more extensive and thorough restorations than had previously been attempted. The discovery of the usefulness of the cohesive property of gold in filling operations soon brought into requisition other means than simple hand pressure for condensing the gold foil into a solid homogeneous mass. It was soon found that greater solidity could be obtained by the percussive force of a mallet applied to the gold through the plugging instrument, so that the use of the mallet became general for the purpose, largely through the persistent advocacy of Dr. W. H. Atkinson of New York. The earlier forms of condensing mallets were simply hand mallets with heads made of various materials and different weights to attain desired variations in the impact and quality of the blow delivered upon the condensing instrument. Later, automatic mallets combining a plugging instrument and mallet were introduced. In these instruments the blow was produced by a hammer propelled by the release of a spring compressed by pressure, the malleting mechanism being contained in a casing connected with the plugging point which was applied to the surface of the filling upon which the impact of the blow was ultimately expended. In 1867, Dr. W. G. A. Bonwill, of Philadelphia, introduced his electromagnetic mallet, an instrument which involved the principle of the Morse telegraphic recorder so modified that the armature of the electro-magnet was effectively utilized as a mallet acting upon the free end of the gold-plugging instrument. With the automatic interrupter of the current afterward added to it the Bonwill instrument contributed greatly to the improvement of gold-filling operations both in the solid-

ity of the gold, its more accurate adaptation to the walls of the cavity, and in lessening the fatigue and discomfort of both patient and operator incident to the operation. The blows delivered by the electro-magnetic mallet while light are extremely rapid, an advantage which its inventor sought to realize in a later device, to be used in connection with the dental engine, known as the Bonwill engine mallet, an instrument of high efficiency and the parent device of many subsequent modifications.

The extensive use of gold as a filling material and the perfection to which the technique of its use for that purpose has been developed, especially in America, has recently brought about a reactive tendency against the display of elaborate operations of gold, especially in conspicuous positions in the front teeth, æsthetic considerations stimulating the search for some substitute more in harmony with the texture and color of human teeth. Recently through the invention of an improved technique by Dr. C. H. Land of Detroit, Mich., and the further investigations of Dr. N. S. Jenkins, an American dentist resident in Dresden, Germany, the use of porcelain as a restorative material has become practically possible and bids fair to supplant gold as a filling, at least in conspicuous situations. The durability of porcelain restorations as compared with gold fillings remains to be tested by time and experience, but the immediate result is in all respects in favor of porcelain, especially in the matter of appearance, which so harmonizes with the teeth structure in color and texture as to be invisible when the operation is correctly performed. The filling of cavities is also extensively done with plastic materials that have the property of becoming hard in the course of time after having been inserted in a soft state. This class of materials includes the amalgams and cements, also gutta-percha. Certain of these materials, the cements for example, serve only a temporary purpose, and their usefulness is therefore of limited duration. The amalgams, however, while unsightly in appearance, are extremely useful; being quite durable and capable of insertion without great difficulty, they can be used in cases of great loss of tooth structure, thus restoring many cases that could not otherwise be as successfully treated, and with less cost than gold filling.

Following the researches of Koch in bacterial pathology, the role played by micro-organisms in the causation of dental diseases became the subject of study by numerous investigators, notably Prof. W. D. Miller, an American dentist resident in Berlin, through whose researches the cause of tooth decay was explained. Similarly the causal relation of disease-producing micro-organisms to disorders of the dental pulp and the tissues surrounding the roots of teeth has been clearly made out, with the result that operations upon the pulp chambers and root canals of teeth in which the pulp has been devitalized by disease or design are now among the recognized conservative operations of dentistry. This advance in the treatment of pulpless teeth has made possible the permanent saving of multitudes of teeth in a condition of comfort and functional usefulness which were previously inevitably sacrificed or lost. Later investigations in the domain of dental and oral pathology are throwing light upon the causes and improving the modes of treatment of those diseases of the retaining tissues of the teeeth which when unchecked result in their early loss by destruction of their attachment to the gums and alveolar sockets.

Dental art has in the development of its operative technique compassed the problem of defective tooth restoration, and has made possible the restoration not only of any portion of a single tooth, but of a whole tooth or any number of missing teeth. Where roots of teeth remain and are not hopelessly diseased or fractured, they form the foundations for that class of restoration known as crown- and bridge-work, the desirability and efficiency of which is directly proportioned to the skill and judgment expended upon its execution.

The grafting of artificial crowns of porcelain upon healthy natural roots is accomplished in a large variety of ways, the attachment being by metallic dowels cemented into the properly enlarged pulp canal of the root, this being in most cases reinforced by means of a gold collar or ferrule connected with the porcelain crown, closely encircling the periphery of the root at and slightly under the gum margin. Perfect adaptation of the crown and root end is obtained by correctly shaping the exposed portion of the root and then fitting to it a thin gold base-plate, to which is adapted the dowel and ferrule, after which the properly fitted porcelain crown is attached to this foundation by gold solder and a backing plate of gold connecting with the platinum pins of the crown. In certain cases hollow crowns made entirely of gold plate shaped to the contour of the original natural crown are used upon the roots of the grinding teeth instead of porcelain crowns, as they possess the advantage of superior durability. Aggregations of crowns permanently united upon their contiguous surfaces and supporting crowns in spaces where teeth have been extracted constitute so-called bridge work. No restorative operation in dentistry requires more judgment and skill, nor has any dental procedure been more abused in its performance than bridge work. Where the operation is intelligently and skilfully done, it constitutes the most satisfactory result both as to comfort, utility, and appearance, that prosthetic dentistry has yet attained; otherwise it defeats the very object for which only it should be undertaken, namely, the restoration of the denture to full functional usefulness and æsthetic appearance.

The department of dentistry technically known as mechanical or prosthetic dentistry comprises all those operations and the laboratory manipulation of the materials involved in the construction of substitutes for lost dental organs and parts of the oral tissues. Where lost teeth are to be replaced by means other than those described as crown and bridge work, it is done by mounting the porcelain crowns upon a base-plate adapted to the surface of the alveolar ridge and in the upper jaw usually to the surface of the palatal vault as well. An impression of the alveolar arch is taken in an impression tray containing a plastic material, which will subsequently harden, usually plaster of Paris or a modeling compound consisting of gum kauri, stearin, and talc; beeswax or beeswax and gutta-percha have been used, but are now practically abandoned for this purpose. Into the matrix formed by the impression a batter of plaster of Paris is poured, which after it has

hardened forms the cast upon which the base-plate to support the artificial teeth in the mouth is constructed. The base plate may be of vulcanite or of metal, and in the former case the porcelain teeth are adjusted to the cast by means of wax, and a wax plate is constructed which is the counterpart of the projected finished vulcanite plate. When the arrangement of the teeth to the wax trial plate has been found to be satisfactory by actual trial in the mouth of the patient, it is returned to the cast and the whole embedded in plaster of Paris contained in a sectional iron vulcanizing flask, similar in construction to the molding flask of the brass or iron founder. The upper and lower sections of the flask are separated after the investing plaster of Paris has fully hardened, and the wax is completely removed by a stream of boiling water, leaving a facsimile matrix in the plaster, which is then packed full of vulcanizable caoutchouc; the flask is then closed, and after being firmly bolted together is subjected to the action of the heat from superheated steam for about an hour at 320° F. in a vulcanizer. The case is allowed to cool, and when removed from the matrix the now thoroughly hardened plate is finished with a fine polish and is ready for insertion in the mouth. Metallic plates serving as the base of support for artificial teeth are constructed by stamping or swaging the flat plate cut approximately to the desired pattern, between male and female dies made from zinc and lead respectively, which have been obtained by casting the molten zinc into a sand matrix made from the plaster of Paris model of the alveolar arches. This furnishes a zinc model or male die, upon which a female die or counter-die of lead is cast, and between these the metallic base-plate is struck up to the form of the alveolar arch upon which it is intended to rest. Upon this base-plate porcelain teeth are fitted and attached by a metallic connection between the platinum pins (which for the purpose are baked in the porcelain texture of the artificial teeth) and the base-plate, union being made by soldering. Dentures upon an enameled platinum base-plate constitute a form of work known as continuous gum work, in which, after the teeth by means of their pins have been united to the plate by soldering with pure gold, porcelain paste or "body," as it is technically called, is packed around the roots and between the teeth; then carved into form until the natural contour is reproduced. The piece is then subjected to high heat in a muffle until vitrified, after the manner of firing or baking china or pottery. It is next given a coating of enamel in imitation of the natural gum color, and after this has been fused in the muffle and the piece finally finished, it constitutes the most artistic, hygienic, and anatomically perfect denture of which dental art is capable.

The prosthetic department includes, besides the restoration of lost teeth, the construction of mechanism for the correction of palatal defects, whereby imperfect speech and deglutition are restored to practically normal condition; it includes also the construction of splints in the treatment of fractures of the jaws and the restoration of parts of the jaws lost by accident or disease; construction of mechanism for the correction of irregular positions of the teeth and for the restoration of facial deformities due to irregular or imperfect development of the jaws and bones of the nasal or facial regions. The correction of irregularities in the position of the teeth has developed such importance and covers such a wide field of study and work as to constitute a distinct specialty of modern dental practice. This department of dentistry is termed *orthodontia;* its importance is due not only to the cosmetic value of its results, but because of the direct bearing which irregular positions of the teeth and deformities of the dental arches exert upon the bodily health.

The whole field of dental and oral pathology has been so far developed by study and research as to place modern dental practice distinctly among the recognized specialties of the healing art. Most of the bacteria causing general bodily disease find access to the system through the mouth, which is also the habitat of many bacteria, benign and disease-producing as well. Hence the hygienic care of the mouth as a protection against disease invasion is of the utmost importance. Late researches have shown that the mouth, its tissues and its secretions, and the teeth themselves, furnish important indications of certain bodily diseases, malnutrition, etc., which are extremely valuable as diagnostic means. The training of the dental practitioner has therefore been enlarged so that in the foundation elements it is now coextensive with that of the practitioner of general medicine, but specialized with reference to its particular field of inquiry.

Edward C. Kirk,
Editor 'Dental Cosmos.'

Dentistry in the United States. From the earliest times dentistry was practised as a branch of surgery. Herodotus speaks of means of preserving the teeth, and artificial teeth are alluded to by Greek and Latin poets. Within the last half century dentistry has become a distinct profession. The Baltimore College of Dental Surgery, established in 1830, was the first institution of the kind in the world. It was the direct result of an agitation to put dentists on a higher professional plane, and followed an unsuccessful attempt to found dental chairs in medical schools. It had been argued that oral pathology and dental mechanics should be taught in the medical schools as branches of medicine and that graduates choosing these courses should receive the degree of M.D. as in the case of other branches of medicine. In the same year the 'American Journal of Dental Science,' the first dental periodical in the world, was established. In 1845 the Ohio College of Dental Surgery (since 1888 the dental department of the University of Cincinnati), in 1856 the Pennsylvania College of Dental Surgery, in 1863 the Philadelphia Dental College were founded. These separate schools taught at first very little medicine, but paid attention almost

entirely to mechanical training and to those branches which a dentist must know. All conferred the degree of D.D.S. In 1865 the New York College of Dentistry was founded with the purpose of educating men to practise dental surgery as a specialty of medicine. The curriculum included the fundamental departments of medicine with operative dentistry and oral prosthetics. In 1867 Harvard University opened a dental department and began to teach dentistry as a branch of medicine with the special degree D.M.D. (*Dentariæ medicinæ doctor*). In 1875 the University of Michigan and in 1878 the University of Pennsylvania followed the example of Harvard in opening dental departments. Forty of the 56 dental schools are now departments of other institutions. Since 1878 there has been a most astonishing increase in dental schools and dental students, due largely to the fact that the dental laws in many States now require graduation from a dental school as a condition for license. In 1878 there were 12 schools and 701 students; in 1902 there were 56 schools and 8,420 students. The number of practitioners of dentistry at present in the United States is about 27,000; upward of 60 institutions are devoted to the systematic education of dentists; the profession has an extensive literature of standard works and periodical publications, and the furnishing of supplies and material used in dental practice is an enormous industry involving millions of capital, a growth which has all developed within 60 years.

In 1840 the American Society of Dental Surgeons, the pioneer of the associations to which dentistry owes so much of its progress, was organized in New York. The National Association of Dental Faculties, organized in 1884, has done much to strengthen courses of study in dental schools. At the time of its organization only those schools were admitted which had proper facilities for instruction and a corps of competent teachers. From time to time standards have been raised by rules governing attendance, instruction, and graduation. There are at present 51 schools in the association, all of which require three full courses of dental lectures. The main defect of these schools as a rule is failure to require a sufficient preliminary general education for admission. The National Association of Dental Examiners was organized in 1883 to secure higher and more uniform standards for admission to dental practice. The entrance requirements of these associations are equivalent to at least two years of high school work.

In Alabama, in 1841, the first State law regulating the practice of dentistry was enacted. This was probably the first dental legislation in any country. The next State to pass a dental law was New York, but this action was not taken till 1868. The English law was enacted in 1878, and those of other countries about that time or later.

Supervision.— The practice of dentistry is now regulated by statute in 52 political divisions of the United States.

In Alaska and Indian Territory, no statutory enactments are given. Examinating boards are appointed in Alabama, Kentucky, North Carolina and South Carolina by the State dental associations; in District of Columbia by district commissioners; in Indiana by the governor, State Board of Health and dental association; in Nebraska by State Board of Health; in New York by the University of the State of New York; in Philippines by the Board of Health; in the remaining divisions by the governor, on recommendation, usually, of the state dental societies.

Licensing.— Interchange of licenses is highly desirable and will doubtless be brought about to some extent in the near future. An important step toward interchange of licenses was taken in 1898 when the New York dental law was amended so that the Regents may now issue their license to any applicant who holds a license to practise dentistry granted by a State board of dental examiners, indorsed by the Dental Society of the State of New York, provided that his preliminary and professional education meets the New York statutory requirements. The dental examiners of Pennsylvania having been indorsed by the New York State dental society and recommended by the State dental examiners, the regents indorse Pennsylvania licenses granted under the new régime.

Licentiates of Other States.— Indiana admits licentiates of other States having equal requirements on "signification of reciprocal courtesy"; Illinois on approved diploma from reputable dental or medical college, or on 10 years' practice; New Jersey and Pennsylvania, on proof of license from other State boards having equal requirements; New Mexico and Utah, on proof of diploma recognized by National association dental examiners; New York, on proof of license from another State board having equal requirements and indorsed by the New York State dental society, or on graduation from a registered dental school and six years' practice; District of Columbia, Louisiana, Michigan, Missouri, Nebraska, Nevada, North Dakota, Oklahoma, South Dakota, Tennessee, Wisconsin, on approved diploma from other States; Kansas, Kentucky, Ohio, Texas, on approved diploma from a dental college in the United States or any foreign country. In the remaining political divisions no provision is made in the law for admission of licentiates of other States.

Synopsis of Requirements, Jan. 1, 1904.— In 33 divisions dental diplomas do not now confer the right to practise, an examination being required in all cases: Alabama, Arizona, California, Colorado, Connecticut, Delaware, Florida, Georgia, Hawaii, Idaho, Indiana, Iowa, Maine, Massachusetts, Minnesota, Mississippi, Montana, New Hampshire, New Jersey, New York, North Carolina, Ohio, Oregon, Pennsylvania, Philippines, Rhode Island, South Carolina, Utah, Vermont, Virginia, Washington, West Virginia.

The following require for admission to the licensing examination: Arizona, diploma recognized by N. A. D. E. or four-year high school course and three years' apprenticeship, or five years' practice.

California, diploma of reputable dental school indorsed by State board of dental examiners, or three-year high school course and four years' dental apprenticeship, or certificate of examining board of another State showing five years' practice.

Colorado, diploma from legally organized reputable dental school.

Connecticut, diploma from recognized dental school, or three years' instruction, or three years' practice.

Delaware, diploma of recognized dental school.

Florida, diploma from reputable dental school.

Georgia and Hawaii, diploma from reputable dental school.

Idaho, three years' experience, certificate from another State board, or diploma from legally organized dental school.

Indiana, diploma recognized by N. A. D. E., or five years as assistant to licensed dentist.

Iowa, diploma from reputable dental schoool.

Minnesota, diploma from reputable dental school, or evidence of 10 years' continuous practice previous to September 1889.

Montana, diploma of reputable dental school, or five years' dental practice, or five years' study under licensed dentist.

New Jersey, common school education, diploma from recognized dental school or a written recommendation from five experienced dentists.

New York, full high school course, degree from registered dental school or medical degree with a special two-year dental course.

Ohio, diploma from legally chartered dental school.

Oregon, diploma from dental school in good standing, or study and practice in Oregon prior to this act

Pennsylvania, three-year high school course, diploma of recognized dental school.

Philippines, diploma from legally incorporated dental school.

Utah, diploma recognized by N. A .D. E., or two years' practice or three years' study with licensed dentist.

Virginia, a fair academic education.

Washington, diploma from recognized dental school.

The following require the licensing examination only:

Alabama, Maine, Massachusetts, Mississippi, New Hampshire, North Carolina, Rhode Island, South Carolina, Vermont, West Virginia.

In the following political divisions either approval of dental diploma or examination by State or other duly qualified board is required:

District of Columbia, Illinois, Kansas, Kentucky, Louisiana, Maryland, Michigan, Missouri, Nebraska, Nevada, New Mexico, North Dakota, Oklahoma, South Dakota, Tennessee, Texas, Wisconsin.

The following, requiring either approval of diploma or examination, admit to examination:

Missouri, three years' study with legally registered dentist or license from another State.

North Dakota, three years' active practice or three years' study with practitioner.

South Dakota, three years' practice or three years' study with practitioner.

Wisconsin, diploma from approved incorporated dental school or four years' practice or five years' apprenticeship.

One State, Wyoming, requires only presentation of diploma to unqualified local officers.

Porto Rico admits to practice on diploma approved by the superior board of health.

JAMES RUSSELL PARSONS, JR.,
Formerly of the University of the State of New York.

Dentists. About the time of the Revolutionary War, dentists came to the United States from England and France. They included Woffendale, who arrived in 1700; Gardette, a French surgeon, 1778; and Lemaire, a French dentist, 1781, who accompanied the Comte de Rochambeau's army. While the Continental forces were in quarters at Providence, R. I., during the winter of 1781–2, Lemaire found opportunity for the practice of dentistry and also for the instruction of one or two students, particularly Josiah Flogg, who commenced practice in 1782, and was, so far as can now be ascertained, the first American dentist. John Greenwood, who became a practitioner about 1784, made sets of artificial teeth for General Washington. American dentists have made important contributions to the progress of dentistry. The dental engine, in its original form, was devised by Morrison in 1846. About 1855 Arthur discovered that gold-foil, which had previously been without cohesiveness, might be made cohesive by being passed through an alcohol flame. Atkinson first recommended the mallet as aid to the filling of teeth with gold. Barnum invented (1864) the rubber dam, which protects the field of operation from moisture during filling, and is also a means of excluding bacteria. Its value has been found to be decided. Richardson was the earliest to advocate (1857) the employment of a galvanic current as a means of inserting drugs into the tissues, though this method has been applied only comparatively recently. Wells discovered the application to dentistry of nitrous oxide, commonly known as "laughing gas." This is the anæsthetic now generally employed for extraction. Charles Goodyear in 1855 obtained in England a patent for a process of making a dental plate of hard rubber (caoutchouc). Artificial teeth were secured in this as a support before its vulcanization. Patents were also secured on subsequent improvements, and the vulcanite base has been of considerable benefit. The enameled platinum denture, used in what is sometimes styled the continuous gum method, was perfected by Allen in about 1846–7. By this method porcelain teeth are secured to a base-plate of platinum; a porcelain paste is then applied to the plate and covered with vitreous enamel. Mention should be made of the researches of Andrews, Black, and Sudduth in dental science. Numerous authoritative works on dental practice have been written and published in America. A 'History of Dental and Oral Science in America' (1876) was published by Dexter. Consult also Wedgwood, 'Progress of Oral Surgery' (1891).

Dentition, including both the formation and the cutting of the teeth, is one of the most important organic processes of childhood and adolescence. The pulpy nucleus constituting the tooth germ appears about the third month of pregnancy, and at the end of it the jaws contain the 20 follicles which are to produce the first teeth. Those of the second dentition appear from the fifth to the ninth month of fetal life, but some do not appear before the end of the second year. The first teeth are usually cut in the last six months of the first year. The central incisors of the lower jaw show themselves first, then come incisors of the upper jaw; the other teeth follow, proceeding in order from the centre backward, except in the case of the canines, which in general make their appearance only be-

fore the four last molars. The number of teeth is then 20. All are temporary and are replaced by those of the second dentition. The first dentition is usually completed during the last months of the second year. In some instances children have been born with teeth, and in many instances the first teeth do not make their appearance till after the 10th or even the 12th month. At the age of 6½ to 7, secondary teeth commence erupting and the first permanent molar, called the six-year molar, makes its appearance. At the same time the roots of the temporary teeth being resorbed the teeth themselves become loose, fall out, and are replaced in the same order as at the original cutting. The renewal of the incisors commences about the seventh and is not completed till the ninth year. Toward the 10th year the first permanent molar or bicuspid appears, next the canine, and then the second bicuspid. The bicuspids are of less size than the molars which they replace, the incisors and canines on the contrary are larger. On the regularity of these proportions depends the greater or less facility in the arrangement of the teeth subsequently cut. From 10½ to 11 years the second great molars appear, and last of all, usually from 18 to 25, the teething is completed by the cutting of the last molars or wisdom teeth. Besides the differences already mentioned between the first and second teeth, the incisors of the latter present on their anterior face two salient lines parallel to the axis of the tooth, and the roots of all of them are larger than those of the former. When the dental process is being performed the bones, which are its site, receive a development proportioned to the augmentation of the teeth in number and volume.

D'Entrecasteaux Islands, dän-tr-käs-tō, since 1884 part of the British protectorate of New Guinea, lie north of the southeast extremity of New Guinea; area 1,083 square miles. They comprise three chief islands separated by narrow channels. They are named after the French admiral and explorer, Bruni D'Entrecasteaux (1739–93), who visited these waters in 1792. His name is also preserved in D'Entrecasteaux Point on the southwest coast of western Australia; and in D'Entrecasteaux Channel, separating the south of Tasmania from Bruné Island. The islands contain boiling springs and other indications of volcanic action. The natives though described as head hunters are said to be skilled agriculturists.

Denudation, the laying bare of underlying rocks by the removal of superficial matter, and also the process by which the earth's surface is broken up and the loose material carried away, chiefly by the action of wind, rain, running water, frost, snow, ice, the sea, plants, and animals. The action of wind is seen in the erosion of rocks produced by the sand and grit which in certain dry regions is swept by the winds against projecting rocks, an action often resulting in the undermining of cliffs and the downfall of rock-masses. Rain is also a potent agent of denudation, its action being both chemical and mechanical. Rocks are more or less altered and decayed, and the decomposed materials carried off in solution by rain-water. In many places the rocks are thus "weathered" to considerable depths, the decomposed crusts varying in thickness from a mere line up to many feet or even yards. The mechanical action of rain consists chiefly in the sweeping away of this disintegrated material. Running water acts also chemically and mechanically. Thus, the rain that sinks underground and rises to the surface again in springs, brings about many changes in rocks. Immense quantities of mineral matter are brought up in solution, and thus, in time, underground cavities are formed, especially in the more soluble rocks. In regions of calcareous rocks, the whole drainage is sometimes conducted underground. This action of underground water often brings about local subsidences, falls of rocks, and great landslips. The denuding action of superficial terrestrial waters is seen in the excavation of gullies, ravines, and river-valleys, one of the most remarkable examples of river erosion being the Grand Cañon of the Colorado (q.v.).

Frost acts with great intensity at high levels and in high latitudes, but even in temperate regions its action is very marked and productive of great disintegration of rocks. Glaciers are likewise powerful denuding agents. They are not only instrumental in transporting the rock-rubbish which is showered down upon them from overhanging cliffs, etc. (see BOULDERS), but by means of the blocks and debris which they drag forward on their beds, they grind, furrow, and smooth the rocks over which they flow. The sea, again, acts like a great horizontal saw, which is continually rasping away the rocks along the coast.

Nor can the destructive action of plants and animals be ignored. Plants send their roots into rock-crevices and wedging the masses asunder, aid the freer percolation of water, and prepare the way for the better action of frost. The destructive action of animals, again, is seen in the weakening of rocks on a sea-coast produced by the drilling and boring of Saxicava, Pholas, etc., and by annelids, echini, and sponges. Rocks so weakened fall more readily before the battering of waves and breakers. Little change may be perceptible, but an examination of the rocks shows that many thousands of feet of solid strata have been gradually removed from the surface of a country. Thus, in many districts where faults occur, no inequality at the surface betrays the presence of dislocations; the whole area has been reduced by denudation to the same level, hundreds or even thousands of feet of strata having been removed from the upcast side of the faults (see DISLOCATION). Denudation proceeds more rapidly in some regions than in others; therefore, the work of no individual river can be taken as a standard by which to estimate the general rate of erosion. Much depends on physical and climatic conditions, and much on the geological structure of a country and the composition of its prevalent rock-masses. Thus, the Mississippi is said to remove from the general surface of its basin one foot in 6,000 years, the Rhone one foot in 1,528 years, the Po one foot in 720 years. Rivers like the Rhine, the Danube, the Elbe, and the Rhone, contain in every 6,000 parts by weight one part of dissolved mineral substance. These rivers, therefore, carry seaward their own weight of dissolved matter in 6,000 years. Consult: Playfair, 'Illustrations of the Huttonian Theory'; Lyell, 'Principles of Geology'; Croll, 'Climate and Time,' and the standard text-books of geology.

Denver, James W., American soldier and frontiersman; b. Winchester, Va., 1817; d. 9 Aug 1892. He removed to Ohio with his father in 1830, where he studied for the bar. Later removed to Missouri, where he raised a company and served in the Mexican war. In 1850 he went to California where he became prominent in politics and was elected secretary of state, and afterward elected to the 34th Congress. Before the end of his congressional term he was appointed commissioner of Indian affairs, but resigned to accept the office of governor of the Territory of Kansas. He returned to Washington after 12 months of service leaving the territory well organized and law-abiding. He returned to California in 1859, but soon after removed to Wilmington, O. He served in the Union army during the Civil War until 1863. Gen. Denver suggested the name Colorado for the Territory formed out of Kansas, and the city of Denver was named in his honor.

Denver, the capital of the State of Colorado, organized 17 Nov. 1858, and named in honor of Gen. James W. Denver, the first governor of the Territory of Kansas, which at that time included Colorado in its limits. It is 2,025 miles from New York; 1,457 miles from San Francisco; 639 miles west of Kansas City; 538 miles from Omaha; and is the chief metropolis of the entire Rocky Mountain region between the Missouri River and the Pacific coast. Its area is 54 square miles and its population is about 175,000; is the principal smelting centre in the United States, and its prosperity reflects the growth of the entire State, which produced (1902) gold, $28,762,036; silver, $12,488,774; lead, $7,770,196; copper, $1,293,011; total, $50,314,019. The taxable property in Denver amounts to $133,686,076, and its net public debt $4,052,199. Denver lies at an altitude of one mile above the sea. The site is about 10 miles east of the base of the foot-hills of the Rocky Mountains in the valley of the south fork of the Platte River, at its junction with Cherry Creek, a dry stream, which carries running water only at intervals.

The climate of Denver is one of the most delightful and remarkable in the country. The data for the years 1897 to 1901 from the United States Department of Agriculture gives the following information: "Discarding fractions of a degree, the mean annual temperature at Denver is 50°, as against 48° at Chicago, 49° at Boston, 55° at Washington, 56° at St. Louis, and 69° at Jacksonville. During the last 32 years, 100° or higher has been touched just 13 times in Denver — 7 times in July and 6 in August. While these high temperatures were maintained only for a few minutes, readings in the 90's are common during every summer month. For July, the warmest month, the average temperature is 72°, and the average daily maximum, or afternoon reading, is 87°. Here, as elsewhere, over the greater part of the United States, the coldest month is January, with an average temperature of 29°. The annual precipitation, which includes rain, snow, sleet, and hail, is 14.00 inches. Chicago, 34.8; St. Louis, 41.1; Washington, 44.8; Boston, 45.0; and Jacksonville, 54.1. Of sunshine Denver has 69 per cent of the possible, as against 65 at St. Louis, 59 at Washington, 54 at Boston and 53 at Chicago. The average relative humidity is slightly below 50 per cent. It is highest in February, 55 per cent, and lowest in June, which has an average of 40 per cent. Twice during my residence of 21 years in the State have we observed a humidity as low as one half of 1 per cent. The annual relative humidity at St. Louis is 70 per cent, Boston 72, Washington 73, Chicago 77, and Jacksonville 80, and for the warmer months — June, July, August, and September — at St. Louis 66 per cent, Chicago and Boston 74, Washington 76, and Jacksonville 82. It will be observed that in the Atlantic States the humidity during the warm months is greater than the annual, just the reverse of that which obtains at Denver. In brief, Denver summers are characterized by warm days and cool nights, the heat of the day not attended by the usual debilitating effects; the winters by an abundance of sunshine, and the general absence of snow and of severe and long continued cold."

The public utilities of Denver are modern in every particular. The street cars of the city, which are operated by the overhead trolley system, cover some 150 miles of streets, and carry each year over 50,000,000 passengers. Gas and electric light and electric power are furnished by the Denver Gas and Electric Company. The Denver City Steam Company supplies many business buildings with steam-heat, and operates 10 miles of pipe line. Telephonic communication is had between Denver and 227 of the principal towns in Colorado, Wyoming, and New Mexico. Denver's supply of water is furnished by the Denver Union Water Company, which takes its water from the Platte River, Bear Creek, and Cherry Creek. The greater portion of the waters are taken during the non-irrigating season and stored in large and extensive reservoirs. The waters from these reservoirs percolate through natural filter beds of sand, before entering the city mains. Probably no city in the world possesses better drinking water. As a commercial city Denver is increasing in importance each year. In manufacturing it produced in 1890 some $30,000,000 worth of products; in 1902 $48,750,000 represents the value of goods made in this city. As Denver's trade territory increases in population, its jobbing trade also increases, and in round numbers the wholesalers of this city sold in 1902 approximately $50,000,000 worth of goods. Denver's banking and financial institutions are strong. The five national banks of the city reported their deposits for 1902 as amounting to $43,852,605.

No educational advantage is denied any pupil in Denver's free schools. They start with the children in the kindergarten and carry them through 12 grades ready to enter college, or with a fair education in all branches of study if school life is to end with the public school. Besides the regular grammar and high school studies, the children may have manual training, special training in cooking and sewing, modern and ancient languages, music and drawing, with special preparation for advanced work in technical schools. The school property is valued at about $4,000,000; annually there is spent for maintaining the schools about $800,000. In addition to the city library are a medical library, several thousand volumes, six law libraries, school libraries containing 60,000 volumes,

DENVER, COLORADO.

exclusive of text-books, and at the capitol building a State library numbering over 15,000 volumes.

Denver has 4 daily newspapers, 35 weekly papers, and a number of trade journals. The city has 12 parks, with a total area of 550 acres, the largest, the city park, contains 320 acres. Denver has 156 church buildings. The public works have kept pace with the advance in other directions. Extensive storm and sanitary sewer systems, carefully graded, curbed, and paved streets, uniform sidewalks of first-class material, and massive steel viaducts are some of the indications of the progress. In 1902 there were 62 miles of sidewalks laid and 45 miles of streets graded and rounded ready for paving or surfacing. The estimated cost of the improvements now under way in 1903 amounts to $1,068,338.

Several great transportation companies centre in Denver, four of which continue across the continent and one, the Denver, Northwestern & Pacific Railroad, now in construction, will make the fifth. The Union Pacific Railway takes its passengers through Denver to the western coast by the way of Cheyenne and Ogden; the Burlington and Rock Island transfer their passengers to the Union Pacific, Rio Grande, or Santa Fé for continuance of the journey. The Santa Fé, whose main line extends south of Denver across the continent through New Mexico and Arizona, makes southern connection for Denver. The greatest transportation enterprise of recent years is the construction of the Denver, Northwestern & Pacific Railroad. By this road the distance between Denver and Salt Lake will be, when completed, 100 miles shorter than by any other route.

AARON GOVE,
Ex-Superintendent of Schools.

Denver, University of, a coeducational institution, in Denver, Col.; founded in 1864 under the auspices of the Methodist Church. Until 1880 it was called Colorado Seminary. The university is now composed of seven colleges; three of the departments are at University Park, a suburb of Denver; and four in the city. The Chamberlin Observatory, which has a very large telescope, is at University Park. In 1902 there were connected with the university 133 professors and instructors and 1,167 students.

Deobund, dē'- or dā'ō-bŭnd, or **Deoband,** India, city in the Saharunpur district, Northwest Provinces; an ancient place, with manufactures of fine cloth and a grain trade. It has many temples, and is much resorted to by pilgrims. Pop. 19,250.

Deodand, dē'ō-dănd (*Deo dandum,* a thing to be given or dedicated to God), an obsolete legal term for anything that had caused a person's death, all such chattels being, by the old rule of the common law of England, forfeited to the king, to be devoted by him to pious uses, though often finding way to his privy purse. In all indictments for homicide, the grand-jury specified the instrument that immediately caused the death, and its value, that the king might claim the deodand and distribute it "to appease God's wrath." Though these forfeitures were originally incurred to the king, yet they were frequently granted to the lord of the manor or territory upon which the death happened. Deodands were abolished in 1846. There has never been anything analogous to this custom in the United States.

Deodar, dē-ō-dăr' ("divine tree"), from the Sanskrit *devadaru*), a tree (*Cedrus deodara*), a native of the mountains of India, where it grows to the height of 100 feet and upward. It chiefly resembles the cedar of Lebanon in habit of growth, and is probably a species of the same genus. The timber is among the most valuable grown in India. The name is rather freely applied to trees, especially to species of the *Coniferæ*. See CEDAR.

Deo'dorizer, a substance used for absorbing foul-smelling gases, or for substituting an odor which is pleasing for one that is disagreeable. Deodorizers are not disinfectants or antiseptics, and should not be confounded with them. They are of no use save to cover up disagreeable smells, and often do a great deal of harm by shutting people's nostrils to real signs of danger.

De Officiis, dē o-fĭsh'ĭ-is (Lat. "of duties"), a treatise in three books by Cicero, on moral obligations written about 44 B.C.

Deogarh, dē'- or dā'ō-gŭr, India, the name of several cities, of which the following two are the chief: 1. In Bengal, 170 miles northwest of Calcutta; it contains a group of temples to which numerous pilgrims resort. Pop. 8,667. 2. In Oodeypore, Rajputana; its chief attraction is an old palace. Pop. 7,400.

D'Eon de Beaumont. See EON D' BEAUMONT, CHARLES.

De Oratore, dē or-ą-tō'rē (Lat. "on the orator"), a rhetorical work by Cicero, in three books, written about 55 B.C. It is in the form of a dialogue, the principal characters being L. Crassus and M. Antonius. The work ranks with the most finished productions of Cicero on account of its varied contents and its excellent style.

Department, the name given certain territorial divisions of countries, especially to the principal territorial divisions of France. At the time of the French Revolution, when the former division of the kingdom into provinces was abolished, and succeeded by a division of it into departments, this division was determined partly by the number of inhabitants, partly by extent of territory, and partly by the amount of direct taxes. The new division was proposed in the Constituent Assembly in 1789, and effected in 1790. The whole kingdom was at first divided into 83 departments, which were subsequently increased by the gradual extension of the empire to 130, and were reduced by the Peace of 1814 to 86. By the cession of Savoy and Nice to France in 1860 the number of the French departments was increased to 89, and by the cession of Alsace-Lorraine to Germany in 1871, the number was reduced to 87. Most of the states of South America are also divided into departments (*departimientos*), but these resemble the French ones in nothing but the name. Each French department is subdivided into arrondissements, these again into cantons, and these again into communes. The name is, also, applied to military divisions, and to various other divisions as of government and schools.

De Pauw, Washington Charles, American manufacturer: b. Salem, Ind., 4 Jan. 1822; d. New Albany, Ind., 5 May 1887. He received a liberal education, worked himself up to the foremost rank among the business men of his State; and was successively a mill-owner, a merchant, and a banker. He was noted for his extensive gifts in behalf of education. His aid to the Indiana Asbury University set it upon a sound basis, and its name was changed to De Pauw University in his honor. He also founded De Pauw College for Women, and several charitable institutions at New Albany, Ind. See DE PAUW UNIVERSITY.

De Pauw University, a coeducational institution in Greencastle, Ind.; founded in 1837, under the auspices of the Methodist Episcopal Church, and known as the Indiana Asbury University until 1884, when the name was changed to De Pauw University. In 1902 there were in attendance 515 students with 29 professors and instructors; number of volumes in library 17,500; grounds and buildings valued at $300,000; productive funds, $290,000; benefactions, $7,500; income, $28,500; number of graduates, 2,110; president, H. A. Gobin, D.D.

De Pere, dē-pēr' or dē-pār', Wis., city in Brown County; on the Fox River at the head of steamer navigation, and on the Chicago & Northwestern, and the Chicago, Milwaukee & St. Paul railroads, about 100 miles north of Milwaukee. Pop. (1900) 4,038.

Depew, Chauncey Mitchell, American lawyer, legislator, politician, and orator: b. Peekskill, N. Y., 23 April 1834. He was graduated from Yale College in 1856, studied law in Peekskill and in New York, and was admitted to the bar in 1858. He was soon after elected to the New York Assembly, and served as chairman of the committee on ways and means. For a time he was acting speaker of the house. In 1863 he was nominated upon the Republican ticket for secretary of state, and was elected by over 30,000 majority. In 1865 he declined a renomination. President Grant tendered him the Japanese mission about this time, but Dr. Depew declined the office, to enter the service of the New York & Harlem Railroad, as attorney. In 1869, when the consolidation occurred of the Hudson River, Harlem and New York Central R.R's he was made a director and attorney for the newly organized company.

In 1872 he accepted the nomination for lieutenant-governor on the Republican State ticket, but was defeated by a small plurality. In 1875, he became general counsel for the entire Vanderbilt system of railroads, and in 1882, second vice-president of the reorganized New York Central & Hudson River Railroad, and president in 1885. The same year Yale College conferred upon him the title of LL.D. During this period he was acting as a regent of the State University. He remained president of the New York Central until 1898, when he became chairman of the board of directors of the Vanderbilt system, which included the New York Central & Hudson River; Lake Shore & Michigan Southern; Michigan Central, and the New York, Chicago & St. Louis railroads.

His political career during these later years was eventful. In 1885 he declined the election to the United States Senate. In 1888 he figured prominently as a candidate for the presidential nomination at the National Republican Convention, withdrawing from the contest in favor of Benjamin Harrison of Indiana, who, after his election and elevation to the presidency, tendered to Mr. Depew the portfolio of secretary of state, which was declined owing to large railroad interests. In 1899, on 17 Jan., he was elected to the United States Senate as junior member from New York State. Since 1885 Dr. Depew has been regarded as one of the leading Republicans of the country. Dr. Depew was married in 1871 to Elise Hegeman, who died 1893, leaving one son. He was married again in 1902 to Miss Palmer.

Dr. Depew's fame abroad is even greater than in the United States. In London and Paris he is regarded as America's representative citizen, and is interviewed and dined accordingly when he makes his annual summer pilgrimage to Europe. This world-wide fame rests largely upon his ability as orator, after-dinner speaker, and lecturer. He delivered important addresses at the Washington Centennial at New York in 1889, and the dedication of the World's Columbian Exposition, at Chicago, in 1893, and orations at the memorial services of President Garfield and General Sherman. As a wit and humorist, Dr. Depew has acquired a name second to none in this country, and he has been in great demand for many years at annual dinners and banquets, as the chief after-dinner speaker. He has published collections of his orations and after-dinner speeches in one volume (1890), and his later speeches (1894). Consult: Clemens, 'Depew Story Book' (1898).

De Peyster, dē pīs'tėr, **Abraham,** American merchant: b. New York 8 July 1658; d. there 10 Aug. 1728. He was the eldest son of Johannes DePeyster (q.v.); and filled many important public offices after the final cession of the New Netherlands to Great Britain. Between 1691 and 1695, he was mayor of New York, and subsequently became chief justice of the province, and president of the king's council, in which latter capacity in 1701 he acted as colonial governor. He was also colonel of the forces of New York, and treasurer of the provinces of New York and New Jersey.

De Peyster, Arent Schuyler, British military officer: b. New York 27 June 1736; d. Dumfries, Scotland, November 1832. He was a grandson of Abraham DePeyster (q.v.). In the American Revolution he was a colonel in the Royal army; was at different times in command of the British posts of Detroit, Mackinac, and elsewhere in Canada.

De Peyster, Johannes, American colonial merchant: b. Haarlem, Holland, 1600; d. New York about 1685. He was one of the early settlers of New York; and became prominent in public affairs during the Dutch possession; was one of the last to swear allegiance to the Crown after the English succeeded to the government; served several times as alderman and deputy mayor, and was frequently urged to become mayor by the English residents, but declined from ignorance of the language.

Depil'atories ("I pull out the hair"), applications used to remove the hair from the body, especially the face and scalp, without injuring the texture of the skin. Quicklime and or-

piment are the most common ingredients. The most celebrated depilatory is the *rusma*, used by Oriental nations, which consists of quicklime and orpiment (tersulphuret of arsenic) boiled in water impregnated with a strong alkaline lye. The parts which are to be deprived of hair are rubbed with this mixture, and after a time washed in warm water. This depilatory acts with great energy, and the utmost care is necessary in using it that it may not irritate and injure the skin. Sometimes a plaster of pitch and rosin is used for the same purpose. The best and most effective means of removing the hair to-day is by means of a galvanic current, and needle electrode, which is applied directly to the hair-follicle, thus killing it. This procedure is sometimes called electrolysis.

Depo'nent, (1) in grammar, a verb which is passive in the conjugation of its tenses, but is not construed according to the usual passive English form. The old grammatic fiction was that such a verb laid aside (*deponens*, laying aside) its passive meaning, but, though somewhat convenient as an aid to classification, this explanation of the form is logically and philologically unsound. (2) In law, a person who depones or makes a deposition; one who gives his testimony in a court of justice; a witness upon oath. See DEPOSITION.

Deposing Power of the Popes, their power, on whatever ground based, to depose sovereigns from their thrones and to annul their subjects' obligation of allegiance. It was the universal belief of the Christian world in the Middle Ages, that if a Christian prince fell into heresy and persisted therein against the admonitions of the Church, the pope might lawfully excommunicate him and procure his deposition, invoking the aid of orthodox princes and of the offender's subjects in making the decree of deposition effective. Such was the consentient teaching of divines and canonists, of church councils and of popes, though not laid down with all the formalities requisite to make such papal supremacy an article of faith. Of course the sovereign against whom the decree was fulminated usually protested and denied the pope's right to depose, or at least denied the justice of the grounds on which the decree was based, still his resistance to the Pope was regarded as rebellion against the decision of the highest court of Christendom. The Lateran council of 1215 directs that if a sovereign persists after warning in letting heresy grow and spread in his dominions, the bishops of the realm should excommunicate him. If he heeds not that judgment, the Pope is to be advised of that fact to the end that he may "declare the vassals of that prince absolved from their allegiance, and invite Catholics to occupy the country." The proceeding was in entire accord with the law of nations as understood in those times; and emperors and kings were crowned and consecrated on the understanding that they held their scepters subject to just such conditions. As Fénelon says, "The Church neither deprived nor appointed lay rulers, but only replied, when the natives consulted it, explaining what concerned the conscience in regard to the political contact or the oath. This is not," he continues, "a juridical and civil, but only a directive and ordinative power." The most explicit assertion of the Pope's deposing power is seen in the celebrated constitution *Unam Sanctam* (1303) of Boniface VIII., who in substance teaches that "both swords, the spiritual and the material, are in the power of the Church, but the latter is to be wielded for the Church, the former by the Church: one by the hands of kings and magistrates, but at the pleasure and sufferance of the priest. One sword must be under the other, and the temporal authority must be subject to the spiritual power." But the claim is no longer made, and the papacy accepts the situation of the Church as it is now, without thought of striving for a return of the ancient order. In the words of Pope Pius IX., "No one now thinks any more of the right of deposing princes which the Holy See formerly exercised; and the supreme pontiff less than any one."

Depos'it, in geology, a layer of soft or hard matter formed by the settling down of mud, gravel, stones, detritus, organic remains, etc., which had been held in suspension in water. Marine deposits are those formed on sea bottoms; lacustrine, those formed at the bottoms of lakes; fluviatile, those formed on river bottoms; and so on. In contradistinction to bed or layer, which is matter more evenly distributed during formation, a deposit is nearly always irregular in form. See GEOLOGY.

Deposit, a term of wide meaning in law, but especially applied to money paid as an earnest or security for the performance of a contract; also to money belonging to one person intrusted to the safe-keeping of another, to be kept without fee, and to be re-delivered on demand. When such a deposit is made to a bank or trading company, interest, according to agreement, is generally paid on it. The person who makes the deposit is called the depositor, and the person who receives the deposit is called the depositary. By the civil law, deposits are divided into two classes, necessary and voluntary. The first class is where the depositor is compelled by some sudden emergency, such as fire or shipwreck, to confide his property to some one, without having opportunity for choosing his depositary. The second class is where the deposit is made by the mutual consent of the parties. Besides such deposits of money received by banking or commercial companies with a view to employing it in their business, a merchant or commercial company frequently deposits with a bank documents, such as deeds or bonds, as security for the payment of a loan.

Deposi'tion, in law, testimony given in court by a witness upon oath; also the written testimony of a witness by way of answer to interrogatories; or affidavit certified by a notary public. When a witness himself can be produced his deposition cannot be read in court.

Deposition of Metals. See ELECTROPLATING.

Depot, dē'pō, Fr. dā-pō, a French word in general use as a term for a place where goods are received and stored; hence, in military matters, a magazine where arms, ammunition, etc., are kept. The term is now usually applied to those companies of a regiment which remain at home when the rest are away on foreign service. In the United States it is the common term for a railway station.

Depres, or Despres, dā-prā, Josquin, zhŏs-kăñ dē-prā, Dutch musician: b. Hainault about 1450; d. Conde, 27 Aug. 1521. He is reckoned

the greatest of the early contrapuntists, but little is known of his personal history. He composed numerous celebrated masses and songs.

Depression, or Dip. See HORIZON.

Depretis, dā-prā'tēs, **Augustin,** Italian statesman: b. Mezzana-Corte-Bottaroni, near Stradella, 31 Jan 1813; d. there 29 July 1887. He was identified with Italian politics from 1849, when he was made civil governor of Brescia, and in 1861 was sent to Sicily as pro-dictator for Garibaldi. He served in a number of the Italian ministries, beginning in 1862 as minister of public works under Ratazzi. Under Ricasoli in 1866–7 he was minister of marine, and afterward held the portfolio of finance. In 1870 he was called to form a ministry himself, and while acting as president of the council and minister of finance he instituted many reforms in the government. In 1879 he resigned, and Carioli formed a government, but Depretis was again placed at the head of the council in 1885, and remained there until his death.

Depriva'tion, the removing of a clergyman from his benefice on account of heresy or misconduct. It entails, of course, loss of all emoluments, but not the loss of clerical character, except it be *deprivation ab officio,* or deprivation of order, which then becomes deposition or degradation. The lighter punishment, simply taking away a clergyman's living or preferment, is called *deprivation a beneficio.*

De Profun'dis, the 130th of the Psalms of David (129th in the Douay version); one of the seven psalms, expressive of sorrow for sin and desire for pardon, used in the liturgy of the Roman Catholic Church, and called the Penitential Psalms. The name De Profundis comes from the Latin version of the first words of the psalm, "Out of the depths." See PENITENTIAL PSALMS.

Deptford, dĕt'fĕrd, England, a metropolitan and parliamentary borough of greater London, formerly a town in Kent and Surrey. In the reign of Henry VIII. a dockyard was established in this place, then known as Deptford Strond. It was in this dockyard that Peter the Great of Russia served as an apprentice and learned ship-building 1691. The London Cattle Market (area 30 acres) occupies the site of the old dockyard. The Royal Victoria Victualling Yard, the largest army and navy supply depot, is located here.

Deputies, Chamber of, the lower of the two legislative chambers or second house of national parliament in France, Italy, Spain, Portugal, and Rumania. The first French Chamber of Deputies was established under Louis XVII. in 1814. By enactments introduced in 1830, any citizen of 30 years and upward who paid direct contributions to the extent of 500 francs might be elected as a deputy. Originally the chamber was elected for five years, in 1824 it became septennial, and in 1830 it was again limited to five years. In France (1903) the chamber consisted of 591 members, elected for four years by universal suffrage. In Italy the members numbered 508; in Portugal 148; in Rumania 183. In Spain the deputies number one to every 50,000 inhabitants.

Deputy, a lieutenant or substitute who exercises power which properly belongs to another who has placed him in his stead. The appointment of a deputy does not free the principal from responsibility. A deputy must take an oath of office. His salary is paid by the government. If authorized for the time being to act with full power of his principal, he is called a general deputy, and may act in his own name. Otherwise when acting in a particular and limited matter he is only a special deputy.

De Puy, de pū, **Henry Walter,** American miscellaneous writer: b. Pompey Hill, Onondaga County, N. Y., 1820; d. 2 Feb. 1876. He constantly contributed political articles to the press; wrote several popular poems, and was the author of 'Kossuth and his Generals,' with a brief history of Hungary (1851); 'Louis Napoleon and his Times,' with a memoir of the Bonaparte family (1853); 'Three Score Years and Beyond' (1873); etc.

De Puy, William Harrison, American Methodist clergyman: b. Penn Yan, N. Y., 31 Oct. 1821; d. Canaan, Conn., 4 Sept. 1901. He was the editor of the Methodist Year Book 1866–89, and was associate editor of the New York 'Christian Advocate' for 25 years. He published: 'Compendium of Useful Information' (1878); 'The People's Cyclopedia of Useful Knowledge' (1879); 'Home and Health and Home Economics' (1880); 'The People's Atlas' (1882); 'University of Literature' (1896).

De Quincey, Thomas, English essayist: b. Greenhay, near Manchester, 15 Aug. 1785; d. Edinburgh 8 Dec. 1859. He was a boy of remarkably quick and precocious abilities, and acquired such great proficiency in classical studies that the master of the school which he attended pointed him out on one occasion to a stranger with the remark, "That boy could harangue an Athenian mob better than you or I could address an English one." His father died in 1793 and young De Quincey was extremely urgent with his guardian to send him to the University of Oxford; and his importunities proving unsuccessful, he ran away from the Manchester grammar-school with 10 guineas and a volume of Euripides in his pocket. He directed his steps first to North Wales, and afterward wandered up to London, where he arrived in May 1800, in an absolutely destitute condition, with his store of money exhausted, and not a friend to whom he could apply. For 10 weeks he roamed through the streets of the metropolis, unprovided with food or shelter, except such as was furnished him by charitable persons. He was at last discovered by his family and sent to Worcester College, Oxford, where he remained till 1808. Having been afflicted with rheumatism in the autumn of 1804, he was induced to alleviate the pain by doses of opium, and a foundation was thus laid of a pernicious habit, which in his case, as in that of Coleridge, proved extremely deleterious both to physical and mental health. For the first 10 years, however, of his addiction to the practice, the evil results were not perceptible, and in the possession of a sufficient fortune, a genial circle of friends, and freedom from bodily ailments, he spent the life of a learned and speculative voluptuary. In 1804 he had first become acquainted with Charles Lamb, and in 1807 with Coleridge. In 1809 he took a lease of the cottage of Grasmere, Westmoreland; previously occupied by Wordsworth, and there, in that beautiful locality, in the

neighborhood of Wordsworth, Southey, and other literary friends, he continued to reside for upward of 20 years. In 1813 a severe derangement of his stomach forced him to increase his doses of opium, which he now took regularly every day. In 1816 he married; and in 1821, making a strong effort to shake off his habitual indolence, he commenced his 'Confessions of an English Opium Eater,' which appeared in the London 'Magazine' for that year, and were published in a collected form in 1822. In 1843 he took up his abode at Lasswade, Mid-Lothian, and here he remained almost to the end of his life. The latest, most complete, and best edition of his works is that published 1889–90, under the editorship of Prof. David Masson, in 14 volumes. See Japp (H. A. Page) 'Life of De Quincey' (1890); Findley, 'Personal Recollections of De Quincey' (1885); Stephen, 'Hours in a Library.'

Dera, dĕr'a (a word derived from the Arabic "der," a monastery), the name of several towns in British India, the two principal places so designated being Dera Ghazi Khan, capital city of a district of the same name in the province of Punjab, about four miles west from the Indus River, in lat. 30° 4′ N., and lon. 70° 50′ E. It is a British military station, is situated on the Sindhsagar Railroad, and contains many stately religious buildings and mosques. Pop. 23,899; and Dera Ismail Khan, capital city of the government district of Deradschat, in the Punjab, about eight miles west from the Indus, in lat. 31° 50′ N. and lon. 70° 59′ E. It comprises an English and Indian city, in the former of which is a British garrison, two regiments of infantry, one of cavalry, and one battery of artillery. The Indian city is surrounded by a mud wall, and occupied by noble native families. It is a trade depot for Afghanistan. Pop. 21,573.

Dera Ghazi Khan, dĕr'a gä-zē' kän, India, a district and a town in the Punjab, in the division of Derajat. The district lies entirely on the right bank of the Indus, and consists of a sandy strip of low land shut in between the Suleiman Hills and the river. The town lies about two miles from the Indus, has many striking mosques, town-hall, court-house, handsome bazaar, cantonments, etc. Pop. of the town 27,886.

Dera Ismail Khan, ēs-mä-ēl' kän, India, a district and a town in the Punjab, in the division of Derajat. The district lies north of that of Dera Ghazi Khan on both sides of the Indus, and is in great part barren and sandy. The town is situated four and one half miles west of the Indus, and is the administrative headquarters of the Derajat division as well as of the Dera Ismail Khan district. There are here various government offices, cantonments for troops, and an important station of the Church Missionary Society. It is a somewhat straggling town on a level plain. Pop. 26,884.

Derajat, dĕr-a-jät, a division or commissionership of India, forming a portion of the Punjab, and occupying part of the valley of the Indus. It comprises the districts of Dera Ghazi Khan, Dera Ismail Khan, Muzaffargarh, and Bannu. Much of it is sandy and uncultivated, but many parts are well cultivated, and irrigation is largely employed. The area under cultivation is increasing rapidly. Area 22,315 square miles. Pop. 1,643,603.

Derbend, dĕr-bĕnd, or **Derbent** ("gateway"), Russia, a port and capital of the district of Daghestan, on the western shore of the Caspian, 140 miles northwest of Baku. It is charmingly situated among vineyards and orchards and fields of maize and madder, on the declivity of a branch of the Caucasus, which here approaches very close to the water's edge. It is surrounded by ancient walls. The harbor is inaccessible to all but small vessels; but a considerable trade is done at the four large markets held here yearly. Silk and cotton fabrics, earthenware, and weapons are manufactured, and saffron is cultivated. It was long considered the key of Persia on the northwest side. It was captured by the Arabs in 728, by the Mongols in 1220, and frequently changed hands before it was formally incorporated with Russian Caucasia in 1813.

Derby, Earl of, a title conferred in 1485 on Thomas, second Lord Stanley, two months after Bosworth Field, where he and his family had greatly contributed to Richmond's victory. The Stanleys were descended from Adam de Aldithley, who attended William the Conqueror to England, and whose grandson, having married the heiress of Thomas Stanley, of Stafford, exchanged the Manor of Thalk in that county, which he had received as his wife's marriage-portion, for that of Stoneley, in the county of Derby, and afterward assumed the surname of Stanley. In 1405 Sir John Stanley, who had married the heiress of Lathom, obtained a grant of the Isle of Man, which he and his descendants ruled till 1733.

Derby, Edward Geoffrey Smith Stanley, 14TH EARL OF, English statesman: b. Knowsley Park, Lancashire, 29 March 1799; d. there 23 Oct. 1869. In 1820 he was returned to the House of Commons as member for Stockbridge, in Hampshire. His very first speech marked him out as a skilled debater, and he rapidly rose to distinction in the House. His views at first inclined him to side with the Whig party. In 1827 he joined Canning's ministry as under secretary for the colonies; and became chief secretary for Ireland and Lord Grey. The opposition, led by O'Connell in the House of Commons, was powerful and violent; but while he firmly resisted the extravagant demands of the opposition, and the agitation for the repeal of the union, he succeeded in passing a number of measures which tended to lessen the prevailing discontent. He improved the administration of justice, carried a bill establishing a system of national education, and afterward, as secretary of state for the colonies supported the bill for the reform of the Irish Church, by which two archbishoprics and 10 bishoprics were abolished. He also gave his warm support to the petitions which were presented to Parliament for the abolition of slavery in the British colonies, and was successful in passing the act for this purpose in 1833. He now joined the Tories; and accepted office under Sir Robert Peel, being again appointed colonial secretary. He distinguished himself by his wise administration of this department during the four following years. In 1851 and 1858 he was commanded by the queen to form a ministry, but on both occasions he had to contend against a majority

in the House of Commons, and was able to maintain himself in office only for a short period. He was more successful in 1860, when, on the defeat of Lord John Russell's government on one of the chief clauses of their reform bill, he undertook to form a ministry. His administration on this occasion was signalized by the reform of the government in India, the successful conduct of the Abyssinian war, and the passing of the reform bill which introduced household suffrage as the qualification for the electoral franchise. Earl Derby joined to great ability as a statesman, and brilliant oratorical powers, a high degree of scholarly culture and literary ability. Among other works he published a successful translation of Homer's Iliad (1864). See Kebbel, 'English Statesmen Since the Peace of 1815: Derby' (1869); Saintsbury in Reid's 'Prime Ministers of Queen Victoria' (1892).

Derby, Edward Henry Smith Stanley, 15TH EARL OF: b. Knowsley, Lancashire, 21 July 1826; d. there 21 April 1893. He was educated at Rugby, and Trinity College, Cambridge. In 1852 he was under secretary of foreign affairs; afterward secretary of state for India. Under his superintendence the management of the British India empire was transferred from the East India Company to the government of Great Britain. In 1866 and also in 1874 he was secretary of state for foreign affairs. Lord Derby became a Liberal in 1879, and was secretary of state for the colonies under Mr. Gladstone from 1882 to 1885. He, however, took a stand against Irish Home Rule in 1886 and afterward ranked among Mr. Gladstone's opponents.

Derby, George Horatio, pen name "JOHN PHŒNIX," American humorist: b. Dedham, Mass., 3 April 1823; d. New York 15 May 1861. He was graduated at West Point (1846), and served in the army during the Mexican war (1846–7). He wrote under the name "John Phœnix" a series of sketches and burlesques, entitled 'Phœnixiana' (1855); and 'The Squibob Papers' (1859).

Derby, Orville Adelbert, American geologist: b. Kelloggsville, N. Y., 23 July 1851. He graduated from Cornell University in 1870, made trips to Brazil in 1870 and 1871; and was instructor at Cornell in 1873–5. In 1875 he became a member of the Brazilian geological commission, and has since been engaged in geological work in Brazil, being at one time curator of the geological department of the National Museum, and holding the position of chief of the geographical and geological survey of São Paulo since 1886. He has published a number of valuable papers on the geology and geography of Brazil, and is considered one of the first authorities on the subject.

Derby, Conn., city in New Haven County, at the junction of the Naugatuck and Housatonic rivers, and on the New York, New Haven & Hartford Railroad; nine miles west of New Haven. In 1893 the towns of Birmingham and Derby were consolidated and incorporated as the city of Derby. It is a manufacturing city of much importance and has abundant water power from the two rivers. There are extensive manufactures of brass and iron goods, paper, pins, and spectacles, and at one time the old town had a large West India trade and noted ship-building yards. A bridge across the Naugatuck River connects Derby with the thrifty manufacturing city of Ansonia. It has several parks, daily and weekly newspapers, a national bank, good public and private schools. Pop. 7,930.

Derby, England, a municipal and parliamentary borough, capital of Derbyshire, on the Derwent River, and the main line of the Midland Railroad, 115 miles north-northwest of London. It has some fine public buildings, among which are the churches of All Saints, St. Alkmund, and St. Werburgh, built before the time of Henry VIII.; St. Mary's (Roman Catholic) designed by Pugin. The Derby public school dates from the time of Queen Mary. There is also a very handsome free library and museum. The principal manufactures are silk, cotton, paper, articles in Derbyshire spar, castings, and porcelain, etc. Derby is one of the oldest towns in the kingdom, and is supposed to owe its origin to a Roman station, Derventio, situated at Little Chester, on the opposite side of the river. Under the Danes it took the name of Deoraby. Richardson, the novelist, was a native of the town. Pop. (1901) 105,785.

Derby Day, the great annual London holiday, on which "The Derby," one of the most popular of the English horse-races, is run. It always falls on a Wednesday, being the second day of the grand race meeting, which takes place in the week after Trinity Sunday. The race is run on Epsom Downs, an extensive plain in the neighborhood of London. This race was instituted by the Earl of Derby in 1780. The entry-money is now $500, but under the new regulations introduced in 1890 the first prize is definitely fixed at $25,000 with any surplus fees. The course over which the race is run is a mile and a half in length. Since the race was instituted the weights have been several times increased, until now the colts have to carry nine stone, and the fillies eight stone nine pounds. Derby day is now regarded, especially in London, as a great holiday, and vast multitudes flock from the city and its neighborhood to Epsom Downs. The grand inauguration racing day of the summer season at Washington Park track, Chicago, is now called the American Derby day.

Derbyshire, a county in England, in the interior; area 1,029 square miles. The county is noted more for its coal mining and manufacturing than for agriculture. Its beautiful scenery and the numerous mineral springs attract tourists and health seekers. Its chief minerals are coal, iron ore, lead, fluor or Derbyshire spar, sandstone, limestone, alabaster, marble, zinc, and elastic bitumen. Some of the industries of the county are the manufacture of iron, silk and cotton goods, calico prints, agricultural implements, paper, hats, porcelain, various kinds of cloth, and vases, urns, etc., from the Derbyshire spar. The coal mining is an important industry and to transport the coal several canals and railroads cross the county. The principal towns are Derby, Buxton, and Belper. Pop. 620,196.

Derbyshire Spar, also called fluorite, and fluor-spar; is abundant in Derbyshire, and also in Cornwall, England. In the north of England it is the gangue of the lead veins which intersect the coal formations in Northumber-

land, Cumberland, Durham, and Yorkshire. It is found of almost every variety of color. The "Blue John" of the Derbyshire miners is a crystalline fluorite in which are alternate bands of blue and pale yellow spar. It is made into ornamental articles such as vases. See FLUORITE.

Derceto, dĕr-sē'tō, the Greek name of a Syrian goddess, the principal female deity of the Philistines, widely worshipped at Ascalon. She was the female counterpart of Dagon (q.v.), terminating like him in a fish. She was a nature goddess presiding over the principle of generation and fertility.

Derecske, dĕ'rĕch-kĕ, Austria-Hungary, a market town in Hungary, in the county of Bihar. In the neighborhood are four lakes, from which, by evaporation, soda is obtained. Nearby is another lake, called Fingoto, celebrated from the earliest times for its baths. In the same locality pearls are found, which, though small, are equal in beauty to those of the East. Pop. 8,272.

Derelict, any property abandoned at sea. Especially a ship abandoned by her crew either by consent or by compulsion, stress of weather, or other unforeseen condition, and yet, to save the owner's rights, if any cat, dog, or other domestic animal be found on board alive, it is not forfeited. The owner may yet recover, on payment of salvage, within a year and a day — otherwise the whole may be taken.

De Reszke. See RESZKE.

Derg, Lough, lŏH dĕrg. (1) An expansion of the Shannon River, between the provinces of Munster and Connaught, Ireland. (2) A lake in the southeast of the county of Donegal, province of Ulster, Ireland. Saint's Isle and Station Island are in this lake.

Derham, dĕr'am, William, English philosopher and divine: b. Stoughton, near Worcester, 26 Nov. 1657; d. Upminster, Essex, 5 April 1735. He became in 1685 vicar of Wargrave, in Berkshire, and in 1689 rector of Upminster in Essex, where he spent the remainder of his life. Though small in stature, distorted, and of ungainly appearance, he had a highly gifted mind, and not only possessed the universal esteem of his parishioners, but acquired considerable reputation in various departments of literature. His best known works are: 'Physico-Theology'; 'Astro-Theology'; and 'Christo-Theology.'

Dermati'tis, a name given to certain inflammations of the skin, characterized not so much according to form and arrangement of the pathological changes taking place in the skin, but rather from their cause. These causes may act from within or without. The characteristic change taking place is some form of erythema or redness, with the characteristic heat, redness, and swelling. Thus there are found dermatitis traumatica, or the dermatitis set up by mechanical injuries such as blows, pressure, friction, scratching; dermatitis calorica, such as is due to sunburn or frostbite; X-ray dermatitis, dermatitis venenata, due to animal, vegetable, or mineral poisons, such as mustard, turpentine, croton-oil, tartar emetic, poison ivy, nettle, aniline dyes, strong acids, strong alkalies, arnica, etc.; dermatitis medicamentosa, or drug eruptions, such as happen following the use of antifebrin, antipyrin, belladonna, arsenic, bromides, iodides, etc. There may be also dermatitis following vaccination or following poisoning in wounds. There are other forms too numerous to mention, but those given are the commonest.

Dermatol'ogy, (from Gr. *derma*, the skin), a science that treats of skin diseases. See SKIN.

Dermat'ophyte, a parasitic plant, a sort of fungus infesting the cuticle and epidermis of men and animals, and giving rise to various forms of skin disease. The commonly known species are *Achorion Schœnleinii* (favus); *Trichophyton tonsurans* (ringworm); and *Microsporon furfur* (dandruff, scurf).

Dermestes, dĕr-mĕs'tēz, a genus of coleopterous insects, the type of the family *Dermestidæ*. The larvæ of this genus are covered with slippery hairs. They devour dead bodies, skins, leather, and other animal substances. One species (*D. lardarius*) is known by the name of bacon-beetle, and is often found in ill-kept ham or pork shops. Many insects, the larvæ of which have similar habits to those of the true *Dermestes*, sometimes receive that name, although they really belong to the genera *Attagenus*, *Necrophorus*, etc.

Der'mot Mac Mur'ragh, Irish king: the last ruler of Leinster, before the sovereignty was assumed by Strongbow, in the reign of Henry II. of England. He became king of Leinster in 1140, and having carried off the wife of O'Ruarc, Prince of Leitrim, was attacked by the latter, and was driven from Ireland in 1167. He betook himself to Aquitaine, where he did homage to the English king, who granted him permission to enlist adventurers in England, to aid him in recovering his kingdom. He received the aid of Richard de Clare, Earl of Pembroke, usually called Strongbow, who married his daughter Eva in 1170. With his aid he proved victorious, but when he died in the same year his kingdom was assumed by his son-in-law.

Dernburg, Friedrich, frēd'rĭH dĕrn'boorg, German journalist and descriptive writer: b. Mentz 3 Oct. 1833. After a university course he rapidly acquired eminence in journalism and politics, and was a well-known correspondent at the Chicago Columbian Exposition. 'From the White City' (1893), a series of World's Fair sketches; 'In the Bonds of Guilt' (1894); and 'The Over Proud' (1889), are typical specimens of his fact and fiction.

Derne, dĕrn, or **Derna,** Africa, a town of Tripoli, in Barca, on the north coast of Africa, in a fertile district. It was captured by the United States fleet in 1815 during the war against Tripoli. Pop. 6,000. See DERNE EXPEDITION.

Derne Expedition (Derna or Dern), an expedition undertaken during the first years of the 19th century by William Eaton, an American who had been United States consul to Tunis in 1799–1803. Eaton became indignant at the abject submission of Christendom, part from fear and part from greed, to the wretched Barbary pirates; he had raged at their insults year after year while he was consul at Tunis; and when Tripoli, in 1801, finally insisted on war despite all payments, eagerly seized the chance of ending its robberies once for all by making it a United States protectorate. About 1792

Hamet Caramanli or Caramelli, pasha of Tripoli, had been deposed by his brother Yusuf and fled to Tunis, where he was then living; and Eaton resolved to have the United States restore him on condition of peace and no tribute, and thus striking terror into the other piratical states. He borrowed $22,000 for Hamet to equip a force, with which our navy was to co-operate; but the naval commanders' hands were tied by their instructions, and in 1803 Eaton's plain-spoken refusal to comply with the bey's extortions caused his peremptory dismissal as consul. He returned to the United States and urged Jefferson to make the country a United States protectorate, but the government could not give *carte blanche* for so daring a scheme to the fiery dreamer. At length, in March 1804, Eaton was sent to the Mediterranean as "naval agent" with Barron's squadron, but without authority or instructions. He cared for neither squadron nor authority if he could have help and be let alone. Meantime Hamet Caramanli had failed and fled to Egypt, where, when Eaton arrived at Cairo on 8 December (having heard at Malta, in September, of Hamet's fiasco), the viceroy was besieging him and a few followers at Minyeh on the Nile. Eaton rescued him at great pains and some peril, and brought him to Alexandria; made a pact with him and a plan of campaign with Barron; and collected an "army" of some 500 floaters,—the majority Arabs, some Tripolitan Kabyles, a hundred Alexandrian Christian Greeks and Americans, a most extraordinary rabble for a desperate military venture,—and started for a march of 600 miles across the Libyan Desert to Derne, the seaport capital of Barca, the most fertile province of Tripoli. They had no provisions but what they carried, and no water for days together; and more than once the Arabs with Hamet were on the point of deserting in a body or cutting Eaton's throat. His energy and moral force finally pulled the entire body through a six weeks' march to Bomba, just east of Derne, 17 April 1805; but no ships were in sight. The Arabs cursed him afresh as an infidel traitor, and resolved to break up next morning; Eaton and the Christians took post on a hill for the night and lit fires, and next morning the waiting fleet saw the smoke and came in. The Arabs rejoined them, and after restocking from the fleet, and resting a week, on the 25th, in co-operation with three cruisers, they assailed Derne, defended by earthworks and 800 men. On the 27th they carried it by storm, Eaton being shot through the wrist. A large force was sent from Tripoli to retake it; and on 13 May he repulsed it in a sharp engagement with the aid of the fleet's guns. Another month passed; Derne showed no enthusiasm over Hamet, one Oriental master being about the same as another; Eaton could not march on Tripoli, some 700 miles farther on, but the pasha's troops could not drive him from Derne. Suddenly the ground was cut from under his feet by Lear's astounding treaty with the pasha, defensible as a treaty, but in its terms most incomprehensible and indecent. Hamet's supporters were left to the pasha's vengeance, Hamet to European exile and a grudging pension, and Hamet's family in the possession of the pasha. As to Eaton, he was left to useless political agitation, idle energies, and drink. See Barbary Powers, United States Treaties and Wars with the.

Derosne, Charles, shärl dė-rōn, French chemist and inventor: b. Paris 1780; d. there September 1840. He devised a still for the rectification of alcohol so arranged that instead of the weaker aqueous spirit which distilled being completely condensed by cold water, it was condensed by water only a little under the boiling-point of the mixture, so that while the alcohol still remained as vapor, a large proportion of the watery vapor was condensed, and thus the distillate was made stronger. This apparatus is called by his name. His most important research was into the composition of opium, in the course of which he isolated a crystalline body, long distinguished as Derosne's salt. He himself did not determine its character, and it was not till some years later that it was distinguished as an alkaloid by Robiquet, and called by him narcotin, the name by which it is now known. He was the first to introduce animal charcoal for decolorizing syrup.

De Rosny, Léon, lā-ôṅ dė rō-nė, French Orientalist: b. Loos, France, 5 Aug. 1837. He became professor of Japanese at the Special School of Languages in 1868, and founder of the International Congress of Orientalists. Among his numerous works are: 'Asiatic Studies' (1864); 'The Origin of Language' (1869); 'Japanese Anthology' (1871); 'A Grammar of the Chinese Language' (London 1874); 'Japanese Religion' (1881); and various translations, pamphlets, and essays.

Déroulède, Paul, pol dā-roo-lād, French poet: b. Paris 2 Sept. 1846. His 'Soldier Songs' (1872) and 'Military Refrains' (1888) were immensely popular, and won him the presidency of the Patriotic League; an association intensely hostile to Germans, and whose agitation seemed likely to lead to a collision with Germany, wherefore the poet was prevailed on to retire from the presidency. He has written a drama on patriotism, 'The Hetman,' and the semi-religious drama, 'The Moabitess.'

Derrick. See Hoisting Apparatus.

De Russy, René Edward, American military officer: b. in Haiti, W. I., 22 Feb. 1789; d. San Francisco 23 Nov. 1865. He was graduated at the United States Military Academy in 1812, serving with credit in the war with England. He subsequently supervised the construction of fortifications in New York harbor and the Gulf of Mexico. During the Civil War he was ordered to the Pacific coast, where he constructed defenses in San Francisco harbor.

Dervish, or Dervis (Per. "poor"), the name of a class of religious devotees of the Mohammedan faith, all leading a life of poverty, and generally practising mendicancy. The observance of strict forms, fasting, and acts of piety, give them a character of sanctity among the people. They live partly in monasteries, partly alone, and from their number the imams are generally chosen. Throughout Turkey they are freely received, even at the tables of persons of the highest rank. There are, throughout Asia, multitudes of these devotees, monastic and ascetic, not only among the Mohammedans, but also among the followers of Brahma. There are 32 religious orders now existing in the Turkish empire, many of which are scarcely known beyond its limits; but others, such as the Nakshbendies and Mevlevies, are common in

Persia and India. All these communities are properly stationary, though some of them send out a portion of their members to collect alms. The regularly itinerant dervishes in Turkey are all foreigners or outcasts, expelled from their orders for misconduct. All these orders, except the Nakshbendies, are considered as living in seclusion from the world; but that order is entirely composed of persons who, without quitting the world, bind themselves to a strict observance of certain forms of devotion, and meet once a week to perform them together. Each order has its peculiar statutes, exercises, and habits.

The numerous orders of dervishes are all divided into two great classes, the dancing and the howling dervishes. The former are the Mevlevies, and are held in much higher estimation than the other class. They are the wealthiest of all the religious bodies of the Turkish empire. The dancing of these dervishes is conducted to sounds of music. The movement at first is slow, but as the dervishes become excited it grows in animation, until at last the actors are exhausted, and are obliged to sit down. After a while they rise up again and resume their dancing, which is repeated several times. The whole is concluded by a sermon. The howling dervishes accompany their dancing with loud vociferations of the name of Allah, and violent contortions of the body such as are seen in persons seized with epileptic fits. In former times these dervishes, after working themselves up into a frenzy, used to cut and torture themselves in various ways with apparent delight. The sheiks of all orders have the credit of possessing miraculous powers. The interpretation of dreams, the cure of diseases, and the removal of barrenness, are the gifts for which the dervishes are most in repute. See FAKIR.

Derwent, dĕr'wĕnt, (1) the name of four rivers in England, in Derbyshire, Yorkshire, Durham, and Cumberland respectively. The Yorkshire Derwent is a tributary of the Ouse. (2) A river in Tasmania. It expands into an estuary where it enters the South Pacific Ocean. A lighthouse, elevated 70 feet above the sea, has been erected on Iron Pot Island, at the entrance of the Derwent, exhibiting a fixed light, visible at from 12 to 15 miles' distance. On the Derwent estuary is the town of Hobart.

Der'wentwater, James Ratcliffe, EARL OF, English nobleman: b. London 28 June 1689; d. London 24 Feb. 1716. His grandfather had been created Earl of Derwentwater by James II., and his father, Francis, married a natural daughter of Charles II. He succeeded to the title in 1705 and entertained a personal attachment toward the Stuart family, which induced him to take part in the attempt to restore them to the English throne. The standard of revolt having been raised in Scotland, Lord Derwentwater commenced the movement in England on 6 Oct. 1715. The cause of the Pretender was a losing one from the first, and in spite of the energy and courage displayed by the Earl of Derwentwater and other Jacobite nobles, they were compelled to surrender at discretion at Preston on 13 Nov. 1715. The Earl of Derwentwater, being impeached for high treason, pleaded guilty, and was beheaded on Tower Hill. His estates were confiscated and given to Greenwich Hospital.

Derwentwater, or Keswick Lake, a beautiful lake in Cumberland, England, in the vale of Keswick. It is about three miles in length and one and a half in breadth, and stretches from Skiddaw on the north to the hills of Borrowdale. Near the northeast corner is the celebrated cascade of Lodore. Its waters are carried to the sea by the Derwent.

Derzhavin, dyĕr-zhä'vēn, **Gab'riel Roma'novitch,** Russian lyric poet: b. Kasan 14 July 1743; d. Novgorod 6 July 1816. In 1793 he was called to the senate, in 1800 was master of the imperial treasury, and in 1802 was minister of justice. The year following he was permitted to retire on full pay. His poetic talent had become early developed, and he is generally allowed to hold the first place among the poets who appeared during the reign of Catharine. He was an enthusiastic admirer of this empress, and has celebrated her in his most brilliant odes. Of these, however, at once the most beautiful and the best-known is his 'Oda Bog,' or 'Address to the Deity,' which, for sublimity both of thought and expression, has seldom been surpassed, and has been translated into most European languages. Almost all his poems are rich in true poetic beauties, though occasionally he indulges too much in gaudy Oriental metaphor. His works, containing, in addition to the Odes, several dramatic pieces and prose writings, were published at St. Petersburg 1810–15.

Desaguadero, dā-sä-gwä-thā'rō, a valley in Bolivia and Peru, between two ridges of the Andes into which the great chain divides, near the city of Potosi. This valley or table-land is about 400 miles in length, and varies from 30 to 80 miles in breadth; area 150,000 square miles, and includes Lake Titicaca, and the smaller lake Aullagas or Uros. Desaguadero signifies in Spanish "a channel."

Desaguadero River, Bolivia, (1) the outlet for the waters of Lake Titicaca. It is 280 miles in length, running from Lake Titicaca southward to Lake Poopó or Agullas, in the department of Oruro. The lake last mentioned is without any known outlet. For many years traffic on this river has been hampered, the Lake Titicaca steamers running only as far as the town of Desaguadero (the head of navigation, pending improvements, for boats of considerable size), while beyond that town smaller steamers, engaged in carrying the silver and tin ores of Oruro and the copper of Corocoro, descended to a point 40 miles farther down the stream. A concession for canalizing the Desaguadero so as to extend navigation about 200 miles farther south was granted by the Bolivian government to a Peruvian corporation in 1892. Moreover a railroad from the northern shore of Lake Titicaca to Cuzco was projected, and has been partly built. These works, when completed, will form a system of land and water transportation unique in all the world; approximately 500 miles in length, and at an altitude ranging between 11,000 and 13,000 feet above the level of the sea, connecting the historic Cuzco (the ancient Inca capital) and the extensive silver and lead districts of Totalaya on the north, with the mines of Corocoro and Oruro. (2) A river called Desaguadero is in Argentina, and flows into Lake Bevedero Grande and separates the provinces of San Juan and Mendoza.

Desaix de Veygoux, Louis Charles Antoine, loo ē sharl an twan de-sā de vā-goo, French general: b. St Hilaire-d'Ayat, Auvergne, 17 Aug. 1768; d. Marengo 14 June 1800. Entering the army at 15, in 1790 he covered himself with glory by his heroic conduct in Moreau's famous retreat through the Black Forest. Behind the ruinous fortress of Kehl, Desaix resisted the Austrian army for more than two months, only capitulating in January 1797, when his ammunition was spent. He served with Bonaparte in Egypt, where he distinguished himself greatly, and was appointed governor of the upper part of the country. He completely subdued Upper Egypt, and received, as a testimony of admiration from Bonaparte, a sword, with this inscription on its blade, "Conquete de la Haute Egypte." His own soldiers used to compare him to Bayard, while the inhabitants named him "the Just Sultan." He was obliged, however, in 1800, to sign the unfavorable treaty of El Arish with the Turks and English, and on his way to France was captured and detained by Lord Keith as a prisoner of war. He afterward obtained his parole, and returned from Egypt just in time to take part in the battle of Marengo, in which he was killed.

Desâtir, the name given to a collection of sacred books, purporting to be the work of the 15 old Persian prophets, together with a book of Zoroaster. The collection is written in a language no longer spoken and equally different from the Zend, the Pehlvi, and modern Persian. The last of the 15 prophets, Sasan, who lived at the time of the downfall of the Sassanides, literally translated the Desâtir, and accompanied it with commentaries. This work was until the 17th century one of the chief sources of the ancient Persian religious doctrines, interwoven with astrology and demonology; and, after having been forgotten for about a century and a half, was discovered at Ispahan and published at Bombay in 1818. Erskine added an English translation, but considered the collection as spurious; and Sylvester de Sacy believed it the work of a Parsee in the 4th century of the Hegira, who invented the language. By some, however, it is considered as genuine. No trace of any connection with the Zendavesta and the magic of the Parsees has been found in the Desâtir.

Désaugiers, Marc Antoine Madeleine, mārk äñ-twañ mad-lēn dā-zo-zhē-ā, French song writer and dramatist: b. Fréjus 17 Nov. 1772; d. Paris 9 Aug. 1827. His life till 1797 was full of adventure; he was at one time a prisoner of the revolted blacks in San Domingo and in momentary fear of death. Going on the stage in Paris in 1805, his parody of the opera 'Danaids' ("The Little Danaids") was acted for 300 consecutive nights. His vaudevilles were remarkably successful. As a light song writer he is second only, if indeed second, to Béranger. Many of his songs will live long; such as 'The Consolations of Old Age,' 'The Picture of New Year's,' 'The Market,' 'Sunday Pleasures,' 'The Palais Royal.'

Desault, Pierre Joseph, pē-ār zhō-zĕf dē-zō, French surgeon: b. Magny-Vernais 6 Feb. 1744; d. Paris 1 June 1795. He was designed for the church, early studied mathematics and philosophy, and was led by his inclination to the surgical profession; in consequence of which he entered the military hospital at Béfort, where his diligence and talent for observation supplied the defects of a suitable instruction, and his situation was favorable for obtaining a knowledge of the treatment of wounds from fire-arms, in which department he afterwards rose to great eminence. He went to Paris in 1764, and was one of the numerous scholars of the celebrated Petit. Two years afterwards he became a lecturer, and though his delivery was bad, he soon became celebrated by introducing a new method of teaching anatomy. While lecturing on the parts of the human body, he treated of the diseases incident to each. After having been several years principal surgeon of the hospital De la Charité, where he increased his reputation by introducing new methods of treatment, or by improving and simplifying those already in use, he was put at the head of the great Hôtel-Dieu in Paris, in 1788. Here he founded a surgical school, in which have been educated many of the most eminent surgeons of Europe. His principal merits were, that he brought accuracy and method into the study of surgery; improved the treatment of fractured bones, by adopting improved bandages; first introduced into France the clinical method of instruction in surgery; and infused into his scholars a generous attachment to their profession. He was distinguished for the skill and boldness with which he performed operations. This happy natural talent, this surgical instinct that guided them in the most difficult cases, compensated his want of professional learning, to which he was so indifferent that in his later years he read very little; and as he was entirely ignorant of internal diseases he was indignant when, at the foundation of the École de Santé, in which he became professor of clinical surgery, the study of medicine and surgery were connected. He died while attending upon the son of Louis XVI., in the Temple. Desault wrote only two small treatises; but the Journal de Chirurgie, in which his scholars published his lectures delivered in the Hôtel-Dieu, and the Œuvres Chirurgicales, edited by Bichat under Desault's name, contain his whole system.

Desbarres, dā-bär', Joseph Frederick Wallet, English military engineer: b. England 1722; d. Halifax, N. S., 24 Oct. 1824. In 1756 he sailed as lieutenant for America, where he raised, and for a time commanded, a corps of field artillery. In 1757 he gained a victory over the Indians who had captured Fort Schenectady; and at the siege of Quebec was aide-de-camp to Wolfe, who was mortally wounded while Desbarres was making a report. He conducted the subsequent engineering operations during the conquest of Canada, and was quartermaster-general in the expedition that retook Newfoundland (1762). He made a survey of the coast of Nova Scotia in 1763–73, and afterward prepared charts of the North American coast for Lord Howe. He was lieutenant-governor of Cape Breton (1784–1804), and of Prince Edward Island (1805–13).

Descartes, René, rē nā dā-kärt, French philosopher: b. La Haye in Touraine 31 March 1596; d. Stockholm 11 Feb. 1650. He was educated at the Jesuit College of La Flèche. Here he studied physics and philosophy according to the scholastic system and showed especial fondness and aptitude for mathematics, which alone

seemed to satisfy his demand for certain and clear knowledge. All else that he had learned seemed to him lacking in the clearness and certainty that would entitle it to be ranked as knowledge. After leaving school he went to Paris where he continued his studies. He then enlisted in the military service of the Netherlands and afterward in that of Bavaria. During these years he was always tormented by doubts, and was constantly seeking a method by which he could attain certainty. At length he made the discovery of his famous principle of certainty which he expressed in the proposition, "I think, therefore, I am" (*cogito ergo sum*), and which he regarded as "the foundations of a wonderful science." In 1629 he withdrew into seclusion in Holland, frequently changing his residence that he might continue his work without interruption. Here he lived for 20 years and produced the works upon which his fame rests. In 1649 he accepted the invitation of Queen Christina of Sweden to come to Stockholm and personally instruct her in his philosophy. The queen preferred to have her lectures in philosophy at 5 o'clock in the morning and Descartes had to proceed to the palace at that hour. The severity of the climate and the life at court were injurious to his naturally weak constitution, and a year after his arrival he contracted an illness from which he died.

For Descartes' philosophy see the article CARTESIANISM. His fame rests not merely upon his contributions to philosophy, however, but also upon his services to physical science and mathematics. He discarded the old methods of explaining physical phenomena by means of final causes, and insisted that everything takes place mechanically. He is one of the chief pioneers of the mechanical view of the world, and formulates clearly the fundamental laws of this mode of explanation, which he extends to explain all physiological processes. In mathematics he made important contributions to the theory of equations and was the originator of the science of analytical geometry.

Descartes' principal works are: 'The Discourse on Method,' which gives a clear account of development of his thought and with which was published his 'Dioptrics,' 'Meteors,' and 'Geometry,' under the common title of 'Essais philosophiques' (1637); 'Meditations on the First Philosophy' (1641); 'The Principles of Philosophy' (1644); 'The Treatise on the Passions' (1650). The French Academy are at present publishing a monumental edition of Descartes' works, several volumes of which have already appeared. The most important writings have appeared in the English translations of Veitch and Torrey. Consult Millet, 'Descartes, Sa vie, ses travaux, et ses decauvertes' (2 vols. 1871). See CARTESIANISM.

J. E. CREIGHTON,
Professor of Philosophy, Cornell University.

Descartes' Rule of Signs is a theorem by which the maximum number of positive or negative roots of an equation can at once be detected on sight. The theorem may be thus explicated: The number of positive roots of an equation cannot exceed the number of variations in the signs of its coefficients, considered in their proper order. A fair example is the cubic equation: $F(x)=3x^3-7x^2+11x+4=0$. Here are but two variations of signs on passing from one extreme term to the other, through the intermediate ones; we conclude therefore that the cubic can not have more than two positive roots. The maximum number of negative roots is seen on applying the same theorem to the equation which is obtained from the original by changing x into $-x$. Thus the positive roots of $F(-x) = 3x^3+7x^2-11x+4=0$ are negative roots of the original cubic, and by Descartes' rule cannot exceed three.

Descendants, as a term of law, is applied to the issue of a person, or the offspring of such issue, to the farthest generation. Such descendants have a prior claim over collateral relatives or ascendants in the inheritance of property left by a deceased ancestor.

Descent in Law is the transmission of the real estate of a person dying intestate to his heir or heirs. The title acquired by the heir, in this manner, is called title by descent.

Prior to the Revolution, the law in England was that real estate could only descend and never ascend; but in the United States the law has been changed by statute, and at the present time real estate may ascend as well as descend; but, as far as the title is concerned, it is called title by descent.

According to the old English law, real estate descended to the oldest son who was living; provided that he had no elder brother who had died leaving a son to survive him; if all the sons had died without leaving issue, all of the daughters inherited together. There were exceptions to this rule, as in one part of England, the youngest child was the heir. Estates tail might also be called an exception, in some cases, as an estate tail female, where the daughter took the property; and if there were no daughters, the estate went to a person outside of that immediate family, the sons being excluded absolutely. In the United States, some of the States have passed laws by which any words used, in the granting of an estate, which would create an estate tail, shall be considered as creating an estate in fee simple, and by this means have abolished estates tail.

The rules of descent are applicable only to real estate, although sometimes they are incorrectly spoken of as applying to personal property also. Distribution is the proper word to use in speaking of personal property.

In many of the States there is a wide distinction between the laws of descent and those of distribution.

The laws of descent and distribution are regulated by statute of the different States, and are consequently subject to change at any time. The laws of the various States on descent and distribution differ materially, and it is therefore necessary to examine with care the statutes of any particular State in order to determine its rule on this subject.

The general rule in the United States seems to be, that real estate descends to children, grandchildren and on down in the lineal line; in default of these heirs, then to parents, and, if they are dead, the estate goes to collaterals; and if there are no heirs to the State. The law of the place where the real estate is situated is the law according to which the estate passes to the heir; and it makes no difference where the decedent was domiciled.

Descent of Man and Selection in Relation to Sex, The, a work by Charles Darwin, published in 1871. The evidences of the descent of man from some earlier, less developed form, collected and marshaled by Darwin, consist of minute differential proofs of similarity of structure, at certain stages of development, between man and the lower animals. This similarity is especially marked in the embryonic stages; and taken with the existence in man of various rudimentary organs, seems to imply that he and the lower animals come from a common ancestor. Darwin reasons that the early ancestors of man must have been more or less monkey-like animals of the great anthropoid group, and related to the progenitors of the orang-outang, the chimpanzee, and the gorilla, and that still remoter ancestors must have been aquatic. The 'Descent of Man' was received with enthusiasm by scientific men, and its influence was much greater than that of the 'Origin of Species.' It had an effect not merely on physical and biological science, but on ethical and religious conceptions. In the volumes containing the 'Descent of Man' Darwin placed his elaborate treatise on sexual selection, which may be regarded as a part of the theory of man's descent. See DARWINIAN THEORY.

Deschamps, Eustache, ès-täsh dā-shäṅ, called MOREL, French poet: b. Vertus, Marne, about 1330; d. after 1415. He composed a multitude of short poems of a political or moral nature. The 'Mirror of Marriage' comprises 13,000 lines. He wrote an 'Art of Poetizing,' the earliest work of its kind.

Descroizilles, François Antoine Henri, fräṅ-swä äṅ-twaṅ ōṅ-rē dā-krwä-zēl, French chemist: b. Dieppe, 11 June 1751; d. Paris, 14 April 1825. He studied chemistry at Paris under Rouelle, and thereafter became professor at Rouen. He especially devoted himself to the technical applications of the science. Berthollet had hardly discovered bleaching by chlorine, when Descroizilles tried it at his works at Lescure-lez-Rouen, and found that it succeeded. He collected the chlorine in water containing chalk, and thus made a step at a very early period in the direction of bleaching-powder. In the course of his operations he contrived different pieces of apparatus for the rapid valuation of commercial products. Thus his alkalimetre for the estimation of alkalies by Vauquelin's method, his apparatus for estimating vinegar (acetimetre), and for bleaching liquid (Berthollimetre), are among the earliest contributions to volumetric analysis. He also contrived a still for the estimation of alcohol in wine. He published a great many researches, especially on technical chemistry. He was the first to show that alum is a double salt.

Desdemo'na, the heroine of Shakespeare's tragedy 'Othello.' She is the daughter of a Venetian senator, Brabantio, and is drawn to love the Moor who visits her father, by hearing him relate the vicissitudes of his adventurous career. She marries him against her father's will and proves a devoted wife, but Othello, through the machinations of Iago, is led to doubt her fidelity, and, in a jealous rage, smothers her. Desdemona's character is marked by modesty, sweetness and innocent truthfulness. See OTHELLO.

Deseada, dēs-ē-ä'da. See DÉSIRADE.

Deseronto, dēz-er-ōn'tō, Canada, a town in Hastings County, province of Ontario; on the Bay of Quinte, at the mouth of the Napanee River and on the Bay of Quinte, the Grand T. and the Canadian P. R R's. It is about 132 miles east of Toronto. Its principal manufactories are lumber-mills, flour, and furniture, car shops, ship yards, chemical works, locomotive works, foundry, and iron smelting works. The chief shipments are lumber building materials, Portland cement, cars, iron, railway supplies, grist, grain, etc. The town contains churches, public and high schools, a town hall, and an opera house. Pop (1901) 3,527.

Desert, a term designating in its broadest application any uninhabited region. In its more ordinary use the word means a portion of the earth's surface that on account of its barrenness cannot support inhabitants. Four classes of desert may be distinguished: (1) Ice-wastes occupy the central plateau of Greenland, the islands of the Arctic Sea, and probably the entire Antarctic continent. (2) Tundras (q.v.) are flat plains, little elevated above sea-level, fringing the Arctic shores of the northern continents, and especially characteristic of Siberia. (3) Temporary deserts, or steppe-lands, border the Asiatic deserts to the north and west. The saline steppes of the Caspian are true arid wastes; but the typical steppes in South Russia are luxuriantly clothed with verdure and flowers in spring. In the dry season they form a dusty plain of withered herbage. The llanos (q.v.) of the Orinoco have similar characteristics, but the pampas of South America include portions perennially green and suitable for agriculture. (4) Arid wastes, or deserts in the popular sense of the word, occur mainly in two zones encircling the world, and corresponding to regions of minimum rainfall. The greater zone extends from near the equator in an east-northeast direction across the whole breadth of North Africa, as the Great Sahara, Libyan and Nubian deserts, over the peninsula of Arabia, through Persia, Turkestan, and the vast tracts of Gobi or Shamo to the confines of China. The sandy zone, thus traced throughout the breadth of the ancient continent from western Africa to lon. 120° E., has been computed to cover an area of 6,500,000 square miles; but the Asiatic portion of this tract includes many chains of mountains, and fertile valleys. The great Indian Desert in the Punjab is the only extension of this belt south of the Himalayas. The ring is completed by the Great Basin of North America in lat. 40° N. The southern zone, less complete, comprises the Kalahari Desert in southwest Africa, the interior of Australia, and districts in Chile and in the Argentine Republic.

Deserts occur at all elevations, from considerable depths beneath sea-level to many thousand feet above it, and with all varieties of surface, from a flat expanse of sand, where the view for days of travel is bounded by a sharp circle as at sea, to rocky mountain slopes rent by rough defiles bare and chiseled by the driving sand. The essential character of an arid waste is its rainlessness, and the scarcity of water on the surface and of water vapor in the atmosphere. Radiation in the clear air is rapid and desert climate is consequently of an exaggerated continental type. The sand in the Sahara becomes heated to over 150° F. during the day, and

THE AMERICAN DESERT

chilled below the freezing point at night, while the diurnal and seasonal extremes in the lofty deserts of Central Asia are much greater. Thus desert-regions are most effective in producing land and sea breezes and monsoon winds in consequence of the marked periodical changes in atmospheric density. Another effect is the mirage (q.v.), a phenomenon which, combined with the great loneliness that oppresses the occasional traveler, probably accounts for the widespread superstitions peopling deserts, above all other places, with evil and malicious spirits. The dreaded sand-storm or simoom is a kind of tornado or whirlwind which raises the sand in tall rotating columns sweeping over the surface with tremendous velocity. Sand-dunes, sometimes several hundred feet in height, are raised by steady winds, and gradually shift their position. Desert vegetation is extremely scanty, consisting mainly of hard prickly plants of the cactus, euphorbia, and spinose kinds, whose surface exhales little moisture. Animal life is correspondingly restricted both in variety and number of individuals. The camel is *par excellence* the beast of burden for conducting traffic across arid wastes. When an overflowing river, such as the Nile, traverses a desert, the land becomes richly fertile in its immediate neighborhood, and wherever springs bubble up through the sand there are oases, bearing palm-trees and grass. Artificial irrigation, especially the sinking of artesian wells, has done much to reclaim tracts of desert for agriculture in the Sahara and to a less extent in Australia, while the area of arid land in the western part of the United States, once considered irreclaimable, is being rendered by irrigation increasingly productive.

Geological considerations show that arid deserts are not permanent features of the earth's surface. The most level expanses have once formed part of the ocean bed, or at least great inland seas. The orographical changes which cut off these seas and created inland drainage areas probably at the same time modified the rainfall of the locality. Excessive evaporation dried up the great lakes, leaving at present a series of diminishing salt lakes without outlet, receiving rivers which dwindle down by evaporation as they flow. The only commercial commodities yielded by deserts are the salts (common salt (borax, sodium carbonate, and sometimes sodium nitrate) left in the dried-up lake beds. These salt lakes are subject to alternate long periods of desiccation and flooding; during the former the area of the desert extends, during the latter it contracts. These periods have been traced out in the case of the Great American Basin by a series of most interesting researches on the part of the United States Geological Survey. See GOBI; SAHARA.

Desert, The Great American. The North American deserts possess all the physiographic, geologic and climatic elements which distinguish the African desert of Sahara. The chief difference between the two regions is the relatively larger area of the Sahara, the arrangement of the topographic units and the occurrence in the Great American Desert of a wealth of mineral resources which the Sahara does not possess. Through the application of modern mechanical agencies by American energies and brain, its wastes have become inhabited by an intelligent and progressive people, and its arid hills and plains made to yield a wealth twice as much per capita as that of any other portion of the United States.

The North American Cordilleran region embraces the whole of our continent between the Great Plains and the Pacific north of the Isthmus of Tehuantepec. Of the grander scenery of the world none is more varied and beautiful than that of this region. From its northern end in far-away Alaska to the jump-off of the Mexican Plateau of the South it presents a marvelous panorama of form, color and sculpture. A few of these features are familiar by name, but the glories of the Cordilleras as a whole have not been written, for even the professional geographer has but an incomplete idea of the region as an entirety, or of its parts and their relations. In fact, much of the Cordilleran region is still so poorly mapped, that there is not yet a chart that gives a correct presentation of its great mountains and valleys. Most people, therefore, have but vague ideas of the Rocky Mountains, the Great Deserts, the western and eastern Sierra Madre, the California sierras, and the Coast ranges — any one of which is as extensive and unique a geographic unit as the great Appalachian region.

The Cordilleran region is likewise one of contrasting extremes. Within it are found every condition of climate, altitude, vegetation and productivity. The rainfall varies from the greatest in the United States (in Washington) to the least in the world (in the Death Valley and the Yuma Desert). Its altitudes range from the highest peaks on our continent (over 17,000 feet) to depressions 300 feet below sea-level. Its vegetation presents the contrast of forests of the largest and most beautiful trees in the world and vast stretches of desert plain with the feeblest mantle of struggling bush and thorn. The region is the motherland of our longest rivers, the Missouri, the Columbia, the Colorado and the Rio Grande; yet it has a million square miles without as much running surface water as the smallest New England township. It has in places mines which yield from a single acre more wealth than whole counties in many Eastern States, and it produces every mineral of the United States; yet again there are hundreds of miles of barren malpais as worthless as any ground the sun shines on. Some of its acres of agricultural soil are the most productive on earth, yielding under intensified and scientific culture the finest and most abundant crops of fruit, grain and tubers; and upon others even the cactus will not grow.

The forested Cordilleras occur in several distinct groups, which are so aligned as to constitute marginal chains of mountains bordering the Eastern and Pacific sides of the Cordilleran region, between which lie the deserts and plateaus. The chief of these groups are, (1) the Montana and Colorado groups of New Mexico, and the eastern Sierra Madre of Mexico, forming the eastern ranges of the Cordilleran region; and (2) the Sierra Nevada, Cascade and Coast ranges of the extreme western United States, and the western Sierra Madre of Mexico, constituting the Pacific or western ranges.

The remainder of the Cordilleran region, including the vast stretches lying between the Sierra Nevada of California and the eastern Cordilleran ranges (Rocky Mountains) in the United States, and between the Pacific Ocean

and the eastern Sierra Madre of Mexico, constitutes the Great American Desert.

Of the total area of the Cordilleran province, three eighths are forested mountains, one eighth plateau, and one half waterless, treeless, turfless mountain and valley desert. The deserts occur in Nevada, Utah, eastern and southern California, Arizona, New Mexico, and all of Texas west of the Pecos, 550,000 square miles. The American Desert is international, however, for in addition to the above area within the United States, it continues southward into Mexico, where it includes most of the states of Sonora, Chihuahua, Coahuila, San Luis Potosi and Sinaloa — another 500,000 square miles — making a total of 1,050,000 square miles which, although one third the area, is as truly a desert in every natural sense as is the Sahara, which embraces an area of 3,500,000 square miles, and has a population of 2,500,000 people.

Through the area mentioned, the Great American Desert stretches southward far into the tropics, a marvelous country, unique in every feature of landscape and vegetation.

In its entirety (with a few exceptional forested summits) this desert province is one of barren, stony mountain ranges, separated by equally barren stretches of desert plain, an aggregation of elongated arid plains and lower mountain ranges, which mostly follow the axial line of the Cordilleras. The individual deserts have many names, and each differs from the others in some minor aspect.

From a technical point of view a desert in its ultimate analysis is a region in which the rainfall is insufficient to produce run-off. The light rainfall, striking the heated rock surfaces and sandy soils, is soon evaporated or drunk in; even the large bodies of water which may start down the mountain sides as roaring torrents usually die out at the margins of the plains. These waters are highly charged with mineral salts derived from the heated rock surfaces, and these salts are readily redeposited upon the surface or in the interstices of the permeable sands. The torrents locally transport the rock debris — boulders, pebbles, and powder — from one locality to another, but only for short distances; and hence the desert plains are usually composed of the debris of the adjacent mountains, which in more humid regions of ample run-off would have been carried to the sea. The expansion and contraction from the daily temperature causes the desert rocks to fracture *in situ* into the desert waste. This is distributed by wind and torrent, and hence the features of the desert are largely air-made as well as water-wrought.

The scarcity of moisture results in the absence of vegetation of the root-twining, soil-gathering, and soil-making type that distinguishes the humid region. Every plant and species attests the aridity of the country. Exactly as in the Sahara, these plants are thorny, coriaceous bushes and shrubs of the cactus, aloe, and acacia families, adapted to withstand their droughty environment, and to defend themselves from attack by man or beast.

Physiographically there are two sub-provinces of the Great American Desert, lying to the east and to the west of the western Sierra Madre and Colorado Plateau respectively. The westernmost of these may be termed the Nevadan and the eastern the Chihuahuan. The western, or Nevadan, Desert occupies much of the area of Utah, Nevada, Mexico, southern and eastern California in the United States, and the states of Sonora and Sinaloa in Mexico. The Chihuahuan Desert occupies the vast area of country lying between the eastern and western Sierra Madre of Mexico and their northern continuation into southern New Mexico and Texas west of the Pecos, and is the so-called Mexican Plateau.

The Great Basin Desert is marked by wide flatness, and is largely a region of ancient lake beds. Its surfaces are in many instances what the geologists term constructional, and its flora is mostly sage brush and grease wood; its agricultural products cereals and tubers; and its minerals gold, silver, and copper. The Sonoran Desert is of a more complicated geological type, and instead of being land-locked is bordered on one side by the Pacific Ocean. Some of its surfaces are also the result of what geologists term destructional processes. Its floral types are the saguara, the palo verde, and the cats-claw. Its sparse agricultural products are fruit and wheat, its mineral resources gold and copper.

The Chihuahuan Desert, marked by parallel plains and ranges, is a relatively higher region; its features are a combination of destructional and constructional processes. Its floral types are the maguey cactus and yucca; its chief agricultural product maize (corn), and its principal mineral product silver.

While the desert plains may be extensive, they also have many phases of variation. There are the alkali plains, white crystal patches of saline efflorescence which vegetation abhors, and vast plains of "doby" (adobe) — brownish chocolate clay soils through which here and there are cut the deep channels of streamless streams. There are the dreary "tabosa" flats covered by headlike bunches of a woody grass, abhorred by animals and useless to man, through which one may travel for days. The great white gypsum desert of the Tularosa valley of New Mexico is one of the most wondrous of all the desert plains. To the eye it is a veritable sea of purest granular snow, marked with wind waves and ripples like the Tropic Ocean, with billows and troughs. Yet it is not snowlike in its torrid heat, which burns and thirsts more than man can tell. In some places there are extensive lakes of crystalline salt which the desert inhabitant uses for herd and flock. Sometimes there are stretches of dreary brown sand hills, great billows gathered around the protecting roots of the thorny mesquite, the particles blowing with each breath of wind, ever seeking a resting place, though seldom finding one.

The half cannot be told of the many other aberrant features of the Great American Desert, like Death Valley, with which no spot in Sahara can compare for sterility and desolation; the great "medanos" or white sand dunes just south of El Paso, each as high as the national capitol, which creep from place to place over the desert plain; the vast plains of malpais in New Mexico with their burning, cutting, black, waterless surfaces of lava; the "flour dust" deserts of Jimenez and Arizona and Sonora, where the traveler is choked with clouds of chalk-white powder; the Crow Flat with its glare that blinds, the Jornado del Muerto, with its hundred whirlwinds, the saguara deserts of Sonora, where

A TYPICAL VIEW OF THE AMERICAN DESERT.

for hundreds of miles grows no blade of grass, or many other spots which are apparently a mockery of nature.

The clouds are the most wonderful manifestations of the desert heavens. The forms of vaporous atmosphere are numerous. In the morning they fill the valleys with snow white vapor, which at midday rises and gathers into solitary fluffs sailing majestically along like great icebergs in a sea of azure ether, or again breaking into small bunches like flocks of sheep. Frequently from one little handful of cloud surrounded by golden sunshine, a ribboned spray of rainfall may be seen dropping upon some lonely spot. Toward night they gather in rolling banks and settle upon the mountain tops, rapturously lingering near the horizon, where they are painted by the setting sun in floods of glorious gold and violet.

Sometimes showers freshen the desert. These are occasionally of sufficient volume to dampen the earth and vegetation, and an awakening of life ensues which is most remarkable. From every shrub and cactus comes a burst of song from birds ordinarily unnoticed. Rabbits creep out and browse, coyotes give tongue in chase of prey. Vegetation seems to awaken instantaneously, plants which before were dry and dust-covered unfold into broad areas of vivid green. Coriaceous ferns, ordinarily lying like dead leaves among the stones, unroll and wave their fronds in the freshened air. From the inconspicuous flowers of the many thorny shrubs of the acacia and yucca tribe the air is laden with perfume.

It would seem paradoxical to speak of the desert in bloom, but the human senses of sight and smell can be regaled by no more pleasant experience than the delicate odors and sweeps of color that sometimes follow an unusual rainfall. Sweeter than the dewy jessamine is the scent of the yellow catsclaw; more delicate than mignonette is the panule of the mesquite.

Like a dainty pencil line drawn across the sheet of desert, the trails may be seen for miles and miles. These, originally made by the wild Comanche and Apache, lead in long tangents from water-hole to water-hole, cutting paths of deep-worn ruts. Were it not for these trails connecting the various water places the desert probably would be impassable, for the priceless water is usually concealed in spots where least suspected. These water-holes were discovered by the aborigines long before the ranchman and settler came or the army wagons and cavalry troops deepened the impress of the trails. What stories of death and pain, thirst and starvation could be told by these old trails! We know that as early as 1528 many of them existed, for in that year Cabeza de Vaca and his three shipwrecked survivors of the Navaez expedition followed these paths from water-hole to water-hole across our southern border, and that modern commerce and migration still use these, the oldest and most stable monuments of the desert.

In the desert water is king. Without its countenance priceless ore is but as dross, and fertile soils are as worthless ashes. Upon the desert plains many men and cattle have died for the want of a drink of water, which millions could not buy. Water is not only the king of the desert, but its despot. It smiles at the millions of acres of land owned by a certain university as a part of its endowment which is still ungraced by its favor. It laughs at the waterless miles upon which the United States invites settlement under the homestead laws; it defies those who would take the rich gold from the placers of the deserts of Sonora and Arizona, where the gold would remain forever without its precious favor.

Like the Sahara, the Great American Desert is superficially waterless. Its plains are usually barren of surface water save for an exceptional saline lagoon. A few brooks, streams, or rivers arise within its larger mountain ranges, but no water ever runs off its surface to the sea. Even the great floods of water which sometimes burst from an erratic cloud with devastating effect are rapidly swallowed up by the sands or evaporated by sun and wind. It is true that there are two long rivers comparable to the Nile of the Sahara — the Colorado and the Rio Grande — which rise in the higher forested mountainous border lands and flow into and across the deserts like great canals, without gathering contributary drainage from them, losing volume in fact from absorption and evaporation in the desert portions of their courses. These are rivers born of the mountains, however, and not of the deserts.

Upon the area of the Great American Desert the maximum rainfall is less than 15 inches per annum, and does not average more than 10 inches. In places such as Death Valley and the Yuma Desert it is less than five inches, these two spots being perhaps the driest in the known world. Deducting from this maximum of 15 inches 60 per cent of its effectiveness, due to loss through evaporation, the actual rain value is only six inches per annum, less than the amount falling in the two crop-growing months of May and June in the eastern States, and less than one half the quantity that fell in September 1901 in a single 24 hours at Galveston, Texas. To this great natural fact the desert is resigned, that within its area the land with a few exceptions, not amounting to 3 per cent, is permanently and hopelessly dry, and even the most sanguine cannot refute this fact.

Before the railways came, the Great American Desert was a most primitive region. In 1880 it was inhabited by a population about as dense as that of the Sahara now, but practically in the same state of culture; and the mission bells rang over the same civilization that existed in 1528. The inhabitants practised irrigation, agriculture, and architecture very much like that of the Egyptians of to-day, and constructed dwellings of unburnt brick and stone. The aborigine found sustenance on the desert, but of a kind upon which the white man could not well exist. Maize was his staple of diet. This with the tunas (fruit of the prickly pear) and the roots of various yuccaceous plants, supplemented by a few wild animals, provided an aboriginal diet pure and simple.

It was no great feat for the Spaniard who already possessed an Old-World knowledge of desert craft to amalgamate with the aborigines. He gave to them a few domestic animals (the goat and the burro, which can live where other animals starve). He also gave to them the Catholic religion and the Spanish language. For nearly 400 years the desert population made no progress in industrial civilization beyond adopt-

ing the wooden plow and the cumbersome wheeled cart known as the *carretta*.

In Mexico the old desert cities and country estates were practically in the same status of civilization that existed in the 1st century after discovery. The cities had no commerce except by caravan; the estates were great feudal districts with their fortified *haciendas*, to which all the surrounding people were attached as fiefs. For 200 miles along either side of the international border in Mexico and our own desert country the unconquered Apache spread devastation from the Pecos to the Colorado; and the only white men there were the soldiers at scattered and lonely outposts, or "bad men" endeavoring to hide from civilization, and hardly better than the Apaches in instincts or action. Here and there in the United States at the widely dispersed water-holes were a few nomadic ranchmen who owned cattle of primitive breed for which there were no purchasers, except the army and beef contractors. Some mines there were also, but these were merely those with easily reducible ores and limited in depth by the distance which a man could dig in solid rock without machines or powder, and from which burdens could be carried on the human back. In Utah alone had the white man attained a foothold, but the Mormons were men who sought the desert to escape civilization, with the ambition of reverting to a culture as purely barbaric as that of Abraham and his descendants who now live in the Sahara.

With the advent of the railroads the modern conquest of the desert began. It was first awakened from its centuries of lethargy by the whistle of the locomotive in the eighties. In the Great American Desert in the United States and Mexico there are now more than 9,000 miles of railway. But for the railroad the Great American Desert would to-day be as unproductive as the Sahara, and still populated, like the Sahara, by people who exist without division of labor, the use of mechanical appliances or extra-territorial commerce. The first railways to be constructed were designed merely as highways between the Atlantic and Pacific seaboards. No thought of revenue from the desert itself was anticipated. Next came a great longitudinal line following the ancient trails of the Aztec from Mexico to Santa Fé. Mining and population soon followed these trunk lines, which are now extending out even into the utmost recesses of the desert, and these feeders — built or in process of construction — will soon equal the aggregate of mileage of the original trunk lines. From the Pecos in Texas to California, a distance of 1,500 miles, the route of the Southern Pacific followed a belt of country devoid of water except occasionally in the Rio Grande. Not a herd of cattle, a modern house, a farm or a mine existed along this desert stretch. Nor would they exist to-day had it not been for the construction of this railway. Now its course is marked by many prosperous embryo cities and villages.

Notwithstanding the apparent scarcity of water, one of the most remarkable features of the American Desert is that water has been secured, often in apparently impossible places, and in quantities which have made possible the existence of cities and industries. Like the deserts of the Sahara and Asia, those of America have a supply of underground water; there is hardly a desert in which the experiment has been tried where waters have not been found within 2,000 feet of the surface. Though not often sufficient for agriculture, enough has usually been found to afford a supply for cattle, railroads, and mines.

Underground water has usually first been found by the railway companies. When the track was first pushed across the desert water was brought from the rear in tank cars; but when the track was completed water was bored for in the desert itself. The engineers have had at command a mechanical appliance second only in importance to the locomotive, and one which in the desert usually goes side by side with it. This is the mechanical drill. At great expense they bored in many places. The existence of underground water beneath any particular area having once been demonstrated by the railroad company, individuals, of course, usually repeated the experiment. Three notable triumphs of the mechanical drill over nature are the flowing wells of the Salton Desert, the flowing well at Benson and a supply of 700,000 gallons a day from the deep wells on the Mesa at El Paso. Each of these supplies of water was obtained from localities which superficially were hopelessly dry.

Several of the largest mines in the desert depend almost entirely upon the water transported on cars. The Copper Queen runs its vast smelters and machinery chiefly by water thus obtained, while the famous Sierra Mojada, of Coahuila, with its population of 5,000 people, has not a drop of water except that brought in tanks a distance of 125 miles. Yet these two mines annually return millions of profit.

But the sterile and hopeless-looking soil of the desert, when artificially watered, is apparently more fertile than that region where rainfall is abundant. There is no nobler spectacle than a dreary waste converted into an emerald oasis by water artificially applied, and in the desert may be seen some of the most profitable and skilful agriculture in the world. The wheat fields of Utah and Sonora, the great cotton farms of Coahuila, the alfalfa valleys of the Rio Grande and the orchards of California are all inspiriting examples. The transformation made in the desert where irrigation has been possible is marvelous, and in one instance — in Southern California — has resulted in the development of communities of great wealth and culture, where the ideals of perfect conditions for existence are as nearly attained as possible.

A word of caution must be written, however, against an overestimate of the agricultural capacities of the desert. It is necessary artificially to collect the precipitation over large areas, and to concentrate it upon smaller areas by impounds and canals. In this manner at least 25 acres must be set aside as unproductive catchment areas for every one that may be cultivated. All rain water that falls upon the desert or upon its neighboring mountain, if it could be protected and carefully preserved, would not irrigate 5 per cent of the great desert area. The efficiency of the rain of the Great Desert region for agricultural purposes is still further diminished owing to the season in which it falls — June to October — too late for the growing crops, the planting and growing months of spring and early summer being dry. From a practical standpoint it is doubtful if even 1 per

cent of the vast area can ever be profitably tilled by irrigation. The underground water supply, too, is entirely insufficient for extensive agricultural uses, even when it is free from injurious salts; and the desert people, after every possible experiment, have long since ceased to anticipate any material supply for irrigation from this source.

From whatever point of view the problem is approached, the sober conclusions cannot be avoided that the desert as an agricultural country has its limitations. The only apparent way in which the area of irrigable lands can be seriously increased is by the construction of reservoirs to save the run-off of the forested mountains, especially that portion of the desert adjacent to the California, Utah and Mexican sierras. Even when this is accomplished there will still be left a vast area of desert. Hence the agricultural product of the desert will never be large, and this product with the exception of the fruits of Southern California will contribute but little for export, and will never be sufficient to supply the needs of its own population. The Great Desert is and will continue to be a profitable market for the consumption of the fresh and preserved food products and forage of the ocean seaboards and Middle West.

Notwithstanding the scarcity of water and forage the pastoral interests of the desert are considerable. Upon the stony foothills and in the mountain cañons the scant herbage and grass supply nutritious foods for many animals, and there are numerous cattle ranches, especially in the Chihuahua province, which are profitable and thriving. Statistics are wanting and hence exact figures cannot be given, but the live-stock values of the desert amount to several million dollars, exceeding the agricultural products many fold.

So far as even the present agriculture in the desert is concerned, it would not exist were it not that its products were consumed at good prices by the people engaged in mining and transportation. One good mining camp, a few acres in extent — and there are many of these — gives employment and remuneration to more people than whole countries of arid farming lands. Previous to the introduction of the railway, mining in the desert was limited to simple processes and products. Without mechanical drills and hoists only moderate depths could be reached, and limited quantities of ore taken out and treated. Consequently the deeper, larger and richer ore bodies remained untouched. Silver and gold were alone considered, and the mines which now yield over $50,000,000 annually of copper could not be touched.

On the California trail near Pearce, Arizona, for 40 years the overland pioneers built their camp-fires against a ledge of quartz. Since the railway came these rocks are being crushed for the gold they contain at one of the most complete and profitable mills in America. The huge stamps and other machines were brought from New York, Pittsburg, Chicago and Denver; the oil for fuel to run them, from California; the food for the village of over a thousand people living in homes built of Texas lumber is all brought in from the great canning, packing, and fruit-giving sections of the country.

A dozen other places in the desert, each with its modern hoists, smelters, converters and electric appliances, are producing millions of mineral wealth per annum. Not only have new mines been opened and equipped, but many of the historic old mines of Mexico, abandoned because the limit of hand mining had been reached, have been re-opened with the aid of the steam-hoist and air-drill, and to-day are more productive than ever.

The Great American Desert in 1900 yielded over $100,000,000 worth of metals — chiefly silver, copper and gold. This represents at 10 per cent a productive capital of $1,000,000,000. In addition to the paying mines, as large an investment is now being made in mine development and preparation for the coming of lines of railway which are everywhere reaching out to new mining fields. There is every possible reason to expect that the mineral output of the desert will be quadrupled the next decade. Mexico's production of gold has increased from $4,000,000, in 1897, to $10,000,000, in 1901; Arizona and New Mexico produced $3,500,000 worth of gold in 1901. Silver, instead of being a dead metal, is being mined with renewed activity and improved appliances. The American Desert, in 1901, yielded about $8,000,000 from the United States, and $34,000,000 from Mexico.

The smelting interests are not the least important adjuncts of the mining industry, and each smelter gives employment to many workingmen. The American Smelting and Refining Company, with its capital of $80,000,000, has great central plants in the desert at El Paso, Aguas Calientes and Monterey. Many of the mines like Boleo, the Copper Queen, the United Verde and Greene Consolidated have their own smelting works.

Many mineral districts of the desert still lie unproductive for want of transportation. This is especially true of the great copper, gold and coal fields of the Pacific States of Mexico, while the rugged western Sierra Madre contain veins of ore awaiting transportation facilities which will furnish many new and important mines.

The total population of the Great American Desert in 1900 was about 1,500,000 people or 1.5 to the square mile, or twice as many to the square mile as the Sahara. Of this total population in the United States, 300,000 are in southern California, leaving less than one person to every two square miles in the remainder of the territory. Of the remaining 700,000 people in the American portion of the desert, at least four fifths are in cities, towns and mining camps. These people in their own picturesque language are by profession "prospectors," "punchers," "nesters," "miners," "lungers," "Mexicans" and "promoters." In plainer English, mineral seekers, cattle men, irrigator-farmers, miners, railroad employees, health-seeking consumptives and laboring Indians, who have abandoned the "blanket" caste, and men who serve as intermediaries between the latent wealth of the desert and the ready cash of the East. As a whole they are an energetic lot. In the United States they consist chiefly of two classes, the Caucasian, whose ingenious brain conceives and develops industries and the Mexican (Indian) peasant, who does most of the manual labor. Across the line in Mexico the same conditions exist, except that the American finds a ready co-operator and companion in the higher caste of Mexican citizens.

The mainsprings of the desert are the hustling western American miners and cattlemen. If any of our readers should still retain in his

mind as a type of the desert citizen the bad man with the slouched hat, flowing mustaches and quick-acting revolver, he is at least 10 years behind the times. Whether from the magnificent climatic conditions which induce healthfulness or from the fact that he represents the survival of the fittest, he comes very near the highest type of an American. Self-reliant, unaffected, well built, well dressed, well read and well traveled, he is a man of resources and action, available for any emergency, freer from provincialism, and a little more cosmopolitan than the average resident of any other section of our republic. The aboriginal population of the Great American Desert was and is of quite a different type from that of the nomadic savage who lived by the chase, in the forested mountains and upon the Great Plains. They were largely village dwellers, home builders and agriculturists who by the arts of pottery and weaving had risen to the cultured stage of barbarism as distinguished from savagery. It was their social arts and habits of industry which produced the highest aboriginal type in the ancient Aztec, and it is their blood (not the Spanish) which to-day constitutes the ruling spirit of the most advanced of the Spanish-American republics (Mexico). Upon the invasion of their environment, first by the Spanish and later by the Anglo-American civilization, they assumed at least a portion of these and to-day they are the people who constitute almost the sole laboring classes of the desert, being called Mexicans in the United States and peons or peasants in Mexico.

It is the intensity rather than the density of the desert population that appeals to the observer. Whatever is done is done better than elsewhere. This is a necessity of the desert condition. It will not pay in that region to trifle with inferior methods or products. In mining the best man and the best machine must be had; in farming with expensive water it is a waste to plant poor seed; if cattle are placed on the range they must be good cattle, and so on throughout the entire gamut of industry. The conquerors of the desert seem to inspire a higher plane of living than that met with in the older rural regions and crowded industrial centres of the United States. There is no quibbling over innovations; if good they are adopted. The universities and agricultural and mining colleges of New Mexico and Arizona would be creditable to any country and they are hampered by no quarrels over dogma or political opinions.

The desert cities, if not as densely populous as those of some regions, are unique in their thrift and prosperity. They are all picturesque communities, presenting an interesting mixture of architectural, social, and business conditions, busy with commerce and buoyant with hopes and prospects. Each desert city is thoroughly alive to municipal improvement and development. Electric lights and street cars, waterworks, schools, churches, and public libraries abound, while many of the American towns have copied from their Mexican neighbors the picturesque plazas or ornate public parks within the central portions of the busy cities. In many of the Mexican desert cities may be seen the union of all the best of modern industrial improvement with the picturesque Spanish architectural features for which these places are noted. Steam and electricity have asserted their mastery, but have concealed their cold mechanism behind the prettily stuccoed and flower-entwined walls of the artistic Mexican type.

The Great American Desert as a place of residence is one of the most salubrious on earth. The same climatic feature which renders it sterile — want of humidity — gives to its air a crystalline clearness and purity nowhere else found. At first sight the desert horrifies the passing traveler, but he who dwells in it for a time learns to love its life-giving air and landscape. In the noble wastes of rock and plain man's soul swells to contemplation and forgets the dross and sham of his artificial civilization. The endless vistas uplift the thoughts, and the skies seem to bring with them a clearer vision and content than all the mist and fogs that ever hovered over a humid landscape.

Robert T. Hill,
Of the United States Geological Survey.

Desert Animals. Men are apt to think of the vast tracts of absolutely treeless arid sand as uninhabited, because they are void of the creatures known to the regions where humanity dwells. Yet these tracts are often teeming with life. On the shadowless expanse which affords no lurking-place, animals, adapting themselves to the exigencies of their life, often assume the pale tints of the sands whereon, by lying motionless, they may be overlooked by their enemies. They not only develop a protective coloring, but acquire certain other capabilities. They learn, for instance, to subsist on a minimum of water, or to store it within their bodies, some, indeed, developing an ability to live altogether without direct water-supply. Many desert animals are said to æstivate, that is, to sleep throughout the summer, as animals of cold climate hibernate by lying dormant through the winter season. The desert snail, in order to protect itself from dessication, builds up a wall of mucus, sometimes with two or three layers, across the opening of its shell to prevent evaporation of its moisture during the extremest heats. Small desert animals, like plain-dwellers, are burrowers, not only because they can thus escape the fierce rays of the sun, but also because they are so protected against their enemies. Even some serpents burrow, and these are more virulently poisonous than corresponding species of a different habit. All the desert creatures, from the snakes and lizards to the camels, are provided muscularly with the ability to shut out from their nostrils and eyes the sand that is blown by the powerful winds; and most of the insects (except the locusts) are practically wingless, so that these strong desert currents do not carry them away.

The large desert animals are swift, and their feet are adapted for the hot rocks and sand by being cushioned beneath with callous skin. The swiftness of these animals is indispensable to their preservation; for they must generally escape their pursuers by flight, since their habitat affords no hiding-places; moreover, they have to travel long distances for both food and water. Examples of this may be found in the camel and ostrich (qq.v.).

The desert is undoubtedly the refuge of certain animals which have been driven by competition from the more desirable habitations, and which, having located in arid land, have adapted

themselves to their unfavorable environment. That they are the unsuccessful and outcast representatives of species living under better conditions is substantiated by the fact that they are almost always closely related to the forms in the fauna of the green, fertile lands beyond the desert; the differences usually being only the changes necessitated by difference of habitat.

Desert Land Act, a statute of the United States passed 3 March 1877, and supplemented in 1891, to encourage irrigation by private individuals or associations. It provides that any citizen or intending citizen, by paying a registration fee of 25 cents, and declaring his intent to irrigate within three years, may occupy desert land not exceeding a section (640 acres) in any of a number of specified Western States and Territories, and if he reclaims it within that time may receive a patent for it. He must spend at least $3 per acre in irrigation or securing water rights; and must have secured the rights before making application. Associations may file joint declarations.

Desert Plants, such plants as are characteristic of arid regions; in general marked by structures adapted to check transpiration of water, such as reduced leaf-surface, absence of leaves, thickened epidermis, hairy or waxy coverings, stomata ("breathing apparatus") in sunken pits, the entrances to which may or may not be protected by hairs, perennial underground parts such as bulbs, tubers, rhizomes; and annual plants which flourish during the wet season, where such occurs, and, like the tops of many of the perennial herbaceous species, die during the dry season. On the other hand water-absorbing organs are often highly developed; the root-systems are not only large but the root-hairs are exceedingly numerous. Storage organs other than underground parts are common, as in many plants with fleshy leaves and in the thick stems of cacti. In regions of less and less rainfall the vegetation becomes more and more monotonous and restricted to the most resistant forms. In addition to intense heat and light, drying winds and small rainfall, the plants have often to adapt themselves to withstand salts which are brought to the surface in solution and left as the water evaporates.

Structural differences and similarities may be observed in the plants characteristic of Alpine and Arctic conditions. Another striking character of desert plants is their restriction to a limited area (see ENDEMISM) by isolation and by enforced adaptability to peculiar conditions, in which respects desert and Alpine plants are similar, but in which each differ from Arctic plants that have a wide range. See ALPINE PLANTS; ARCTIC PLANTS; HALOPHYTES; PLANT GEOGRAPHY; XEROPHYTES.

Desertas, dā'sĕr-tȧs, a group of three small rocky islands in the Atlantic Ocean, to the southeast of Madeira, visited at certain seasons of the year by fishermen and herdsmen.

Deserted Village, The, the title of a poem by Oliver Goldsmith (1770). It is supposed to describe the village of Lissoy, in the County of Westmeath, Ireland. See GOLDSMITH, OLIVER.

Deserter, in military affairs, a soldier or sailor who quits the service without leave. In the United States desertion from the army or navy in time of war is subject to court-martial which nearly always means a sentence of death. Desertion under ordinary conditions is punishable by dishonorable discharge and five years' hard labor. The United States government offers a monetary reward for the arrest and delivery of a deserter, the sum usually ranging from $20 to $30. In every civilized country the laws against desertion are similar to those of our own land — always severe upon the man who abandons his duty, punishing him with harshest discipline, and sometimes, death.

Desertion by either husband or wife without lawful reason is sufficient cause for legal separation, or instituting proceedings for divorce. A wife, however, may secure an order to protect money or other possessions she may acquire from the time of desertion. This makes her property immune against husband or his creditors. On the other hand the husband is not held responsible for any debt or contract his wife may engage in during her voluntary leave of his "bed and board." In nearly all parts of the United States, as well as in countries of Europe, desertion is good ground for divorce, though there are differences as to the period of time which must elapse before action can be instituted.

Desfontaines, Pierre François Guyot, pē-ār frăṅ-swä gē-ō dā-fôṅ-tān, Abbé, French writer: b. Rouen 1685; d. Paris 1745. He was one of those known to us more for their controversies with Voltaire, and his biting attacks, than from their own productions. Voltaire, by the superiority of his wit, succeeded in gaining many to his opinions; but impartial judges have long agreed that he was not altogether correct, and that the criticisms of the Abbé Desfontaines, though severe, are by no means unjust. One of the works of the abbé, which had the misfortune to excite the particular displeasure of the poet, was the well-known 'Dictionnaire Néologique,' of which the sixth edition appeared in 1750 and which was intended to guard the purity of the French language, as the great writers of the 17th century had formed it; and in this respect it has certainly proved of much service.

Desful, dĕs'fool, or **Dizful,** dēz'fool, Persia, city in the province of Khuzistan, 30 miles northwest of Shuster. About 30,000 inhabitants.

Desgoffe, Blaise Alexandre, blāz ä-lĕks-ändr dā-gôf, French painter: b. Paris 17 Jan. 1830. He is famous for having imitated jewels and trinkets with pastes, and transparent coats of color. Among his works are: 'Oriental Agate Cup of the 16th Century,' after the original in the collection of jewels in the Louvre; 'Oriental Vase on Enameled Pedestal of the 16th Century'; 'Amethyst Vase of 16th Century,' Luxembourg; 'Onyx Jug'; 'Money Bag of Henri II., Enamels of Jean Limonsiu,' Luxembourg; and many fruit and flower pieces.

Deshoulières, Madame Antoinette de Ligier de la Garde, äṅ-twäṅ-ĕt dė lē-zhē-ā dė lä gärd dā-zoo-lē-ār, French poet: b. Paris 1 Jan. 1638; d. there 17 Feb. 1691. During the war of the Fronde she followed her husband into exile at Brussels, and he rescued her after she had been for eight months imprisoned at Vilvoorden as a suspicious personage. She was called the 10th muse and the French Calliope on account

of her idyls 'Les Moutons' and 'Les Fleurs.' Her subsequent failure in writing tragedy caused this advice to be given her: "*Retournez à vos moutons.*" Her best work and inspirations are found in her 'Idylls,' especially in 'The Sheep,' 'The Flowers,' 'The Birds.' Voltaire was of opinion that of all the French poets of her sex she had the greatest merit. Several learned societies elected her a member, and her agreeable manner, her animation and wit, which sometimes, but rarely, gave way to a gentle melancholy, made her the centre of attraction in the best societies at that period.

Desicca'tion, the evaporation or drying off of the aqueous portion of bodies. It is practised with fruit, meat, milk, vegetable extracts, and many other matters. It is usually done by a current of heated dry air, and as such may be considered as distinguished from evaporators, so called, to which furnace heat or steam heat is applied.

Desiderio da Settignano, Di Bartolommeo Di Francesco, dē bar-tō-lōm-mā'ō dē fränchĕs'kō dā-sē-dā're-ō dä sĕt-tēn-yä'nō, Florentine sculptor: b. 1428; d. 1476. He was a pupil of Donatello. His chief work is the tomb of Carlo Marsuppini, chancellor of the Florentine republic, in the church of Santa Croce. Another church in Florence possesses a statuette of the Infant Jesus by this sculptor, of which there is a replica in the Louvre. The genuineness of many busts attributed to him has of late been disputed.

Desiderius, Lombard king. He was the last ruler of the Lombards and after being besieged in Pavia by Charlemagne was carried captive to France.

Design, in painting, the first plan of a large work, drawn roughly, and on a small scale, with the intention of being executed and finished in large. See Drawing.

In music, design means the invention and execution of the subject in all its parts, agreeably to the general order of the whole, especially in the composition of works of classical formulæ as required by a sonata or symphony.

In manufactures, design expresses the figures with which the workman enriches his stuff or silk, and which he copies after his own drawing, or the sketches of some artist.

In architecture, a plan of an edifice as specified by the ground-plans, elevations, sections, and any other outlines necessary to guide its construction.

Design, Schools of, schools in which art is taught with an industrial application in view rather than a purely æsthetic end. Theoretically such schools may be considered as intermediate between schools of technology, in which (with the exception of the architectural courses) designing is of a purely mechanical nature and application, and schools for the training of artists; yet in actual practice this distinction is not always followed. The best results in applied art are produced by foundation work similar to that essential in preparation for a distinctively æsthetic career. The courses in such schools vary in detail but generally include most of the following branches: free-hand drawing; the theoretical principles of decoration, and the history of art — especially in its decorative aspects; copying and variation of designs; original designing for textile fabrics, wall-paper, stained-glass, pottery, leather-work, book-covers, etc.; and the study of the best examples of designing — for which accessible museum collections are essential. To this is added instruction in technical manipulation.

The definite endeavor to promote art education with the purpose of developing and improving the art industries of the nation had its rise in England as a result of the first international exhibition, that of 1851, at Hyde Park, London. In the United States a similar movement originated in Boston in 1870, and was an outcome of the former. The related branches of industrial art drawing and manual training owed much to the impetus given by the Centennial Exhibition of 1876. The new spirit was felt by the public schools and wrought marked changes in them during the next quarter of a century, and museums of art were created and developed. Among the institutions offering courses in applied art in the United States, may be mentioned the schools of Cooper Union; the Lowell Free School of Industrial Design (1872), affiliated with the Massachusetts Institute of Technology; the School of Design for Women in Philadelphia; the School of Design of the University of Cincinnati; and the University of Minnesota, which has a four years' course in drawing and industrial art. The large cities of Europe were provided with facilities for teaching industrial art long before such a necessity was apparent in Great Britain and the United States. In Paris the École Nationale et Spéciale des Arts Décoratifs, in Berlin the Bau Akademie, and in Vienna the Imperial Art Institute, may be especially noted. The great schools devoted to the training of artists created the atmosphere and impulse without which the more practical schools would be impossible, but they hardly come within the scope of this review. Among the results produced in Great Britain by the recognition in 1851, of the superiority of France in the arts of applied design, was the creation of the South Kensington Schools and Museum of Art, which have been powerful factors in effecting the great change in that nation. See Art Education.

Désirade, dā-zē-räd, an island of the West Indies, dependency of Guadeloupe, from which it lies about nine miles to the east. Since 1814 it has been a French possession. It has an area of 10 square miles, and a population of about 1,300, composed mainly of emancipated slaves. It is known as the island which Columbus first discovered on his second voyage in 1493, and to which he gave the Spanish name Deseada, "desired."

Desjardins, Alphonse, Canadian journalist and politician: b. Terrebonne, Quebec, 6 May 1841. He was educated at Masson and Nicolet colleges, and was admitted to the bar in 1862. In 1868 he turned his attention to journalism, was on the staff of 'L'Ordre,' and later became editor-in-chief of 'Le Nouveau Monde.' He assisted in organizing the Papal Zouaves sent to the aid of the Pope in 1868, and is a member of the Order of Pius IX. He was a member of the lower house of the Canadian Parliament 1878–92, and was then called to the Senate. In 1893 he was mayor of Montreal, and in 1896 for a short time minister of militia, and then minister of public works.

Arabic, Byzantine, and European Designs of the 15th and 16th Centuries.

European and Asiatic Designs of the 17th and 18th Centuries.

Desjardins, Martin, mär-tăn, gallicized name of **Martin Vanden Bogaert,** French sculptor: b. Breda, 1640; d. Paris 2 May 1694. He excelled as a sculptor, decorator, and wood-carver, executing many works for the churches of Paris, the College of the Four Nations, palace of Versailles, etc. His chief work was a monument to Louis XIV. 1686, removed in 1792 and destroyed save a few parts now in the Louvre and the Invalides. Another Louis XIV., an equestrian statue, remains at Lyons, with several portraits in busts and bas-reliefs at the Louvre and at Versailles.

De Smet, dē smĕt, **Peter John,** American Jesuit missionary to the Indians: b. Dendermonde, Belgium, 31 Dec. 1801; d. St. Louis, Mo., 23 May 1873. In 1822, being yet only a scholastic in the order, he was sent by his superiors to join the Jesuit mission in the United States and was an instructor first in the Indian school at Florissant, Mo., and then (1828) in the university newly founded at St. Louis. After this, having been ordained priest, he entered on his destined field of labor as missionary to the aborigines, traversing on foot or in canoes or with whatever means of conveyance was possible, the regions inhabited by the Potawatomies, Sioux, Blackfeet, Flatheads, Pend' Oreilles, and other tribes in the valleys of the Missouri, Yellowstone, Platte, and Columbia, and on both sides of the Rocky Mountains.

On many occasions he was a commissioner on behalf of the United States government in pacifying the redmen when, provoked to fury by the wrongs done them, they went on the war path. In his journeys he wandered over 100,000 miles in those wildernesses in the course of his labors of 40 years. But in the meantime he made visits to Europe repeatedly, to collect funds for support of the missions and to enlist young men for labor in the same field.

His collections in Europe amounted to 1,000,000 francs. He wrote several narratives of his experience in the western wilds, among them: 'Letters and Sketches of a Residence in the Rocky Mountains' (1843); 'Oregon Missions' (1847); 'Western Missions' (1863); 'New Indian Sketches' (1868).

Des Moines, dē-moin, Iowa, city, capital of the State, and county-seat of Polk County; near the geographical centre of the State, lon. 16° 43′ 52″ W.; lat. 41° 35′ 45″ N. It is situated at the junction of the Des Moines and Raccoon rivers, and is entered by 12 steam railroads and 4 interurban electric roads, operating 70 miles of track. The city is built on a plateau 849 feet above the sea-level, is intersected by both rivers, which are spanned by eight bridges, and is 54 square miles in area. The business portion lies near the rivers and the residences are on the higher grounds beyond.

Industries.—The city is located in the heart of a rich coal mining district, the mines in the vicinity employing over 2,000 persons, and having an annual output of 600,000 short tons. The principal industries, besides coal mining, include pork packing, and the manufacture of starch, structural iron, liquors, brick, and tile, foundry and machine shop products, brass goods, carriages and wagons, furniture, typewriters, cotton and woolen goods, and wall paper. It is also noted for its immense insurance interests, there being in the city 25 insurance companies. The Federal census of 1900 shows for all industries 494 establishments; capital, $7,911,764; 4,557 wage-earners; wages, $1,942,509; value of product, $10,488,189.

Banks and Publications.—There are 16 banks in the city, with a combined capital of $2,000,000, and deposits on 1 April 1905 of $21,835,966. There are published in the city three daily newspapers, four weekly newspapers, and 47 other periodicals.

Public Buildings, Churches, Educational Institutions, etc.—Among the most imposing structures in the city are the new State capitol, erected at a cost of $3,000,000; the Soldiers' Monument, costing $150,000, erected on the site of the old state house; the State Historical building, for the collection and preservation of historical records, specimens of art, science, and taxidermy, frontage 260 feet, depth 90 feet, height 60 feet, cost $500,000; the county court-house; the United States government building, containing the post-office and Federal courts; the State arsenal; the city library, containing over 50,000 volumes; two large hospitals, and the city-hall. There are several small libraries, five large opera houses, and 28 hotels. There are 91 churches in the city divided among the following denominations: Baptist, 9; Christian, 12; Congregational, 4; Protestant Episcopal, 2; Evangelical, 6; Friends, 1; Hebrew, 4; Latter-Day Saints, 1; Lutheran, 10; Methodist Episcopal, 19; Methodist Protestant, 3; Mormon, 1; Presbyterian, 7; Roman Catholic, 5; United Brethren, 4; Unitarian, 2; and Scientist, 1; and there are also 8 church missions. Church population, 20,478. The education of the young is provided for by 47 public schools and several high schools; for higher and technical education there are Drake University (Christian), founded in 1881; Des Moines College (Baptist) (q.v.), founded in 1865; Danish Lutheran College; Highland Park Normal College (Presbyterian); Iowa College of Medicine and Surgery; one college of osteopathy, and 7 technical schools. A military post for cavalry and artillery was established here by Congress, the land and buildings costing $200,000.

Public Works.—The city has 19 public parks covering in all 600 acres of land, and the Iowa State Fair Grounds, 600 acres in extent, are also permanently located there. The streets are well laid out and paved, there being 77 miles of brick and asphalt pavement; the city is lighted by gas and electric light, the gas distributed by 100 miles of mains, and the electric current carried over 110 miles of wire; the sewage and water systems are excellent, the waste being carried off by 93 miles of brick and pipe sewers, and the water conveyed to all parts of the city through 110 miles of mains by the Holly system for general use and fire protection.

History, Government, and Population.—Des Moines was first settled in 1846 by emigrants from Ohio, Indiana, Kentucky, and Missouri. In 1851 it was incorporated as the town of Fort Des Moines and in 1857 received its charter as the city of Des Moines. In 1856 it became the capital of the State by act of the legislature. The present form of government (1905) is under the general incorporation laws of the

State and council of nine members elected annually and representing the seven wards into which the city is divided. There are also police, fire, educational, and other city departments. The annual income of the city is about $1,100,000, and the budget of expenditures reports to $800,000, the principal items being $420,110.17 for schools, $98,000 for the fire department, $65,000 for street lighting, and $35,000 for the police department. The city debt in 1905, exclusive of school debt, was $727,777; property valuation $62,000,000, and tax rate $18.75 per $1,000 in West Des Moines and $22.00 per $1,000 in East Des Moines, the difference being due to the fact that the two sections are in different school districts. Compared with other cities of the United States, it ranks as follows: Clearing house reports, 52; banking, 25; post-office receipts, 31; population, 59. The predominating nationalities are American, German, Irish, Italian, and colored, in the order given. Pop. (1850) 502; (1870) 12,035; (1890) 50,093; (1900) 62,139; (1905) 75,428.

L. F. Andrews.

Des Moines College, a coeducational institution at Des Moines, Iowa, was organized in 1865 under the name University of Des Moines. This name was afterward changed to Des Moines College in order to conform more nearly to the aim of its supporters, the Baptists of Iowa. Like most schools of the kind, it has passed through severe financial struggles and reverses. It is now entirely free from debt, with an invested endowment of about $80,000 and pledges sufficient to increase this sum to $100,000. It also has a beautiful campus comprising two blocks upon which are two substantial brick buildings. An additional block adjoining is set apart as an athletic field, the whole comprising about nine acres and valued, with the buildings, at $90,000. The school has four departments: college, academy, music, and art. The college has steadily maintained as its aim a high class of work, and has taken rank with the best of Iowa colleges. It has 22 instructors. It was the first college to become affiliated with the University of Chicago. Under this arrangement the work of the school is constantly subject to the approval of the University. Professors and instructors have ample opportunity to carry on their own studies, either in attendance at the University or by correspondence.

J. P. Stephenson.

Des Moines River, the largest river in Iowa: formed by the east and west forks in southwest Minnesota; flows south-southeast to the capital city, then southeast to a point about four miles below Keokuk, where it empties into the Mississippi River; estimated length, 500 miles. It drains 10,000 square miles in Iowa; flows through a region rich in agricultural and grazing grounds, bituminous coal, and timber; receives the water of Raccoon, North, Middle, South, and Boone rivers. In its lower course it falls rapidly and affords abundant water power for manufacturing.

Desmoulins, Benoît, Camille, bĕ-nwä kā-mĕl dā-moo-lăn, French revolutionist: b. Guise, Picardy, 2 March 1760; d. Paris 5 April 1794. From the commencement of the Revolution he was connected with Robespierre, with whom he had studied at college. His friendship for Danton was the cause of his fall. Robespierre, at the head of the committee of Public Safety, was making rapid progress toward tyranny. Danton, assisted by the leaders of the Cordeliers, intended to resist this committee, and Camille commenced the attack in his journal, 'Le Vieux Cordelier,' in which he declared himself against the terrorists. With Danton he was arrested on 30 March 1794. On 2 April he was condemned, and on the 5th executed.

De Sola, Abraham, Canadian rabbi: b. London, England, 18 Sept. 1825; d. New York 5 June 1882. Under the careful supervision of his father he received a thorough Hebrew education, and having perfected himself in his general studies, he was called in 1847 to Montreal, Canada, by its Portuguese-Hebrew congregation. His scholarship and energy soon brought him to the front, and in 1848 he was appointed professor of Hebrew and Semitic literature in McGill College, Montreal. His literary labors consisted partly of contributions to the 'Occident' of Philadelphia and 'The Jewish Messenger' of New York, on historical and rabbinical themes, and partly of a revision of the Portuguese-Hebrew liturgy. On 9 Jan. 1872 he opened the House of Representatives of Washington with prayer, the first foreign clergyman to have received the privilege. Among his more important works may be mentioned: 'The Sanatory Institutions of the Hebrews'; 'Lectures on the Mosaic Cosmogony'; and 'Scripture Zoology.' He was for many years president of the Natural History Society of Montreal.

Desola'tion Land, or **Desolation Island,** an island belonging to Chile, in the archipelago of Tierra del Fuego. It is 70 miles long and about 15 miles in breadth. The name Desolation Island is also sometimes applied to Kerguelen Land (q.v.) in the Indian Ocean.

De Soto, dā sō'tō, **Bernardo,** Costa Rican statesman: b. 1854. He was elected president of the republic in 1887. During his administration the finances of the country, disordered by Guardia, were placed on a secure footing, and the work of completing the interoceanic railway from Port Limon, on the Caribbean Sea, to San José, the capital, and thence to Punta Arenas, on the Pacific coast, was prosecuted. Under him the long-dreamed-of unification of the central American republics became an accomplished fact.

De Soto, Hernando, ār-năn'dō, Spanish nobleman, conqueror, and explorer: b. Villanueva de la Serena (Badajoz) about 1496; d. 1542 or 1543. The date of his birth can not be ascertained precisely, some authorities placing it as late as 1500. But that which is here given is more likely to be correct, especially because we find him bearing a conspicuous part in central American expeditions between the years 1516–20. We can not easily assume that he was less than 20 in 1516. As a captain in 1523–4 he shared the adventures of Córdoba's fleet on the Nicaraguan coasts, and was overcome by Gil Gonzalez Dávila (q.v.) through treachery. Joining Francisco Pizarro in Panama with two ships, 60 men, and 10 horses, to take part in the conquest of Peru, he was appointed second in command. In 1532 he was the first Spaniard who spoke with Atahualpa; going to visit the unfortunate Inca in the character of an ambas-

sador, he continued to be well disposed toward him during his captivity. He returned to Spain in 1536, where he married in Madrid, the following year, Inés de Bobadilla, daughter of Pedrarias Davila (q.v.). Wholly misled by the first reports of the wealth of Florida, De Soto resolved to undertake the conquest of that country, which was represented to be as rich as Peru. He sold his property, and devoted the proceeds to the equipment of his ships and the outfit of his men, Charles I. bestowing upon him readily enough the title of governor of Florida and Cuba. At Sanlúcar he collected 950 fighting men, besides the sailors. Seven large ships and three small ones formed the fleet, his wife and family accompanying him in the San Cristóbal. Sailing from Sanlúcar 6 April 1538, he reached Santiago de Cuba safely, and there entered upon his duties as governor of the island; but transferred his authority at that point to his wife before proceeding to Havana (August 1538). By his orders Havana harbor was fortified (see CUBA). During the stay in Cuba his command was strengthened; 1,000 well-armed men were finally ready, and this was probably the best force which up to that time had undertaken the conquest of any part of America. The fleet sailed from Havana 12 May 1539. In Florida the Spaniards were moderately successful until they reached the province of Tascaluza, where a great host of natives attacked them. It was said that in this nine hours' fight 11,000 Indians fell, while on the Spanish side 70 were killed and nearly all (including De Soto himself) were wounded. Worn out by the long marches, which did not lead to the discovery of treasure, the soldiers plotted to abandon the enterprise. On learning of this, De Soto marched his men toward the interior, hoping to reach New Spain (Mexico) by land, and knowing that, at any rate, his followers would not care to desert him when the ships had been left far behind. In a nocturnal battle (December 1540) the Spaniards were again severely treated. Four months later they came upon a fort surrounded with a stockade, in storming which many were killed, and nearly all wounded. De Soto still led them forward, through the present Gulf States, and probably as far north as Kentucky, until he contracted a fever and died — according to Garcilaso, in 1542, though Herrera says 1543. The Spanish soldiers, who had thought to leave their commander in the lurch, were in this manner finally separated from him. At first they buried him in a trench the natives had opened near a village on the bank of a great river he had discovered; but several days afterward — either fearing the hostiles would dishonor the body, or suddenly realizing how they themselves might best honor it — they hollowed out the trunk of an evergreen oak, weighted the rude coffin with armor, placed the disinterred body within it, and sunk it by night in the deepest part of the river, which they called the Grande and we call the Mississippi.

MARRION WILCOX.

De Soto, dẹ sō'tō, Mo., a mining city in Jefferson County, on the St. Louis, Iron Mountain & Southern Railroad, about 40 miles south by west of St. Louis, and 15 miles west of the Mississippi River. In addition to its mining interests of zinc and lead, it has a large trade in agricultural products. Its industries include a flouring-mill, and the repair shops of the railroad. Pop (1900) 5,611.

Desoxybenzoin, phenyl-benzyl-ketone, $C_6H_5.CO.CH_2.C_6H_5$; obtained by the action of zinc and hydrochloric acid on chlorobenzil $C_6H_5.CO.CHCl.C_6H_5$, or by heating monobrom-stilbene with water to 180°. It crystallizes out of alcohol in large tables which melt at 55°. Desoxybenzoin can also be obtained by reducing benzoin $C_6H_5.CO.CH(OH).C_6H_5$.

Despard, dẽs'pärd, **Edward Marcus**, Irish soldier: d. London 21 March 1803. He was superintendent of the English colony in Honduras. In consequence of complaints made against him he was recalled in 1790. This made him disaffected, and he matured a plan to assassinate the king on his way to open Parliament. The conspirators were arrested and tried by special commission at Southwark 5 Feb. 1803. There being no doubt of their guilt, Despard and nine of his associates suffered death.

Despenser, dẽ-spẽn'sẽr, Hugh le, English courtier: b. about 1262; d. 27 Oct. 1326. He distinguished himself as a soldier and diplomat in the service of Edward II. and became Earl of Winchester in 1322. His tyranny as the royal favorite led to a revolt of the barons and his own downfall.

Despenser, Hugh le, English courtier, son of the preceding: b. about 1290; d. November 1326. He deserted the baronial party for that of Edward II., and became a royal favorite. He and his father were involved in the misfortunes following the flight of King Edward from London, and were beheaded in the same year.

Despériers, Bonaventure, bō-nä-vän-toor dā-pā-rē-a, French writer: b. Arnay-le-Duc about 1505; d. 1544. He was secretary to Margaret of Navarre. He wrote a series of 90 stories: 'New Recreations and Merry Conceits,' printed in 1558. In 1537 was published his 'Cymbalum Mundi' in French, a virulent attack on the Christian religion, which was burned by the common hangman, and of which only one copy is in existence.

Des Plaines (dẽ plān) **River** (named from a species of maple called by the French *plaine*). A river of Illinois which rises in the southeastern part of Wisconsin and flows south and southwest until it unites with the Kankakee River at Dresden, Ill., to form the Illinois River. In length the Des Plaines is about 150 miles. For some distance the river flows almost parallel with the shore line of Lake Michigan. For several miles the waters of the Des Plaines have been made to contribute to the Chicago Drainage Canal (q.v.)

Despoblado, dāz-pō-blä'dō (desert), a name given in South America to any barren tracts in the Andes, which are so high and cold as to be uninhabitable. It is given as a specific name to (1) a treeless, uninhabited plateau, nearly 10,000 feet above the sea, on the Bolivian and Argentine frontier; and (2) a region in Peru between the central and western Cordilleras, ranging from 14,000 to 18,000 feet above the sea-level.

Despot (from the Greek *despotēs*), originally a master, a lord; at a later period it became an honorary title which the Greek emperors gave to their sons and sons-in-law when governors of provinces. Alexis III., surnamed Angelus,

toward the end of the 12th century, is said to have first introduced this title, and to have made it the first in rank after that of emperor. Thus there was a despot of the Morea, of Servia, etc. At present, despot means an absolute ruler, as the emperor of Russia; but, in a narrower sense, it conveys the idea of tyranny, as in fact the possession of absolute power and the abuse of it are two things bordering very closely on each other.

Despoto Dagh, dĕs pō tō dăh, a mountain chain of European Turkey, extending from 30 miles to the east of the Balkans to the bank of the Maritza.

Dessaix, Joseph Marie, zhō-zĕf mā-rē dā-sā, French general: b. Thonon, Savoy, 24 Sept. 1764; d. 26 Oct. 1834. He served at the siege of Toulon, and in Italy under Bonaparte; was elected in 1798 to the council of 500, where he opposed the *coup d'état* of the 18th Brumaire. He was made a brigadier-general by Bonaparte in 1803, and, in the campaign of 1809 against Austria, a general of division, receiving from the emperor the surname of *L'intrepide*, and the title of count of the empire.

Dessalines, Jean Jacques, zhŏń zhāk dā-sà-lēn, emperor of Haiti: b. 1760; d. 14 Oct. 1806. He took the name of the person in whose service he remained until 1790; after that time he fought under Biasson, and, still later, joined Toussaint L'Ouverture. In his struggle against Gen. Rigaud he signalized himself as much by his cruelty as his bravery. In 1802 he surrendered to Gen. Leclerc. But when an epidemic of yellow fever fell upon the French army and almost annihilated it, he attacked Rochambeau with an army of 30,000 blacks, thus obliging the French commander to surrender to the English, and to leave the island (1803). In 1804, when governor-general of Haiti, he issued an order for the general slaughter of the white inhabitants. In October of the same year he was proclaimed emperor, and made an unsuccessful attempt to take the city of Santo Domingo in March 1805. Incurring the enmity of his own followers, he was killed in an ambuscade near Port au Prince.

Dessau, dĕs'sow, Germany, capital of the duchy of Anhalt, in a valley on the Mulde, on the railroad between Berlin, Köthen, and Leipsic. The principal building is the ducal palace, built in 1748, containing both a picture-gallery and a library, in which are numerous MSS. of Luther. The manufactures consist of woolen and linen cloth, hats, leather, tobacco, musical and other instruments. The ground around Dessau, originally a sandy waste, has been completely reclaimed, and is now covered with beautiful gardens. Pop. 42,375.

Dessicants, in medicine, substances that check secretions from mucous membranes or cause cicatrization. See ASTRINGENTS.

Desterro, dăs-tār'rō, also called officially **Florianopolis,** Brazil, the capital of the state of Santa Catharina. It is situated on a long and narrow island near the mainland, and its foreign trade passes through the port of São Francisco, which is one of the best on the coast of southern Brazil. During the revolt of the navy in 1893, the most critical period through which the new Brazilian institutions have passed, Desterro and its port were headquarters of the rebellion. Pop. (1903) estimated 15,000.

Destouches, Philippe Néricault, fē-lēp nā-rē-kō, French dramatist: b. Tours, France, 22 Aug. 1680; d. near Melun, France, 4 July 1754. His comedy, 'The Boaster' (1732), is a masterpiece in matter, in elaboration, and in character delineation; Lessing classes that work, with its companion piece, 'The Spendthrift' (1736), as "models of the finer high comedy." Hardly inferior to these is 'The Married Philosopher' (1727), largely based on the author's own life.

Destroying Angels. See DANITES.

Destutt de Tracy, Antoine Louis Claude, ăñ-twan loo ē klōd dā-stüt dė tra-sē, COUNT, French philosophical and metaphysical writer: b. Paris 20 July 1754; d. there 10 March 1836. Though in repeated peril during the French Revolution, he survived to write 'Elements of Ideology' (1817), a development of Condillac's philosophy, and in part an exposition of what then passed for economics. His 'Delineations of the Politics of the World's Nations' (1820), and prior works, received considerable notice in the United States through Jefferson, who translated the 'Commentaire sur l'Esprit des Lois' (1806) into English and had it published in Philadelphia (1811).

Desulto'res (from *desilio*, "I vault"), the Latin name for vaulters or leapers, who jumped from one horse to another. The Scythian, Indian, and Numidian cavalry were very expert desultores, and each man carried at least two horses to the field. When one was weary he jumped with great agility upon another, which he led by his hand. The Greeks and Romans introduced the same practice in their games, races, and funeral solemnities, but never, as far as we know, in war. Homer describes a vaulter of this sort who performed his feats on four horses at once (Iliad, xv. 679); and Livy (xxiii. 29) describes a kind of Numidian cavalry in Hasdrubal's army in Spain, in which the soldiers had two horses each, and in the heat of an engagement frequently leaped, fully armed, from one to another. Ælian gives a similar account of a tribe dwelling not far from the Danube, who, on this account, were called *Amphippi*.

Detachment, a body of troops or part of a fleet selected from the main body for some special service.

Detaille, Jean Baptiste Edouard, zhŏń bāp-tēst ĕd-oo-ard, dė-ta-yė, French painter: b. Paris 5 Oct. 1848. He is distinguished for his treatment of battles and military subjects. One of his best pictures, 'The Passing Regiment,' is in the Corcoran Art Gallery in Washington, D. C.

Detective, one who searches for criminals or ferrets out crime. The work of the detective is allied to that of the police, and wherever a police force exists there is some detective work to be done, though only in connection with a large police force are men regularly assigned to detective work. The police force of New York includes a body of men known as detective sergeants, who have charge of the work of looking for criminals or investigating such crimes as seem to call for their services. The United States government maintains a force,

known as Secret Service men, whose principal duties consist in unearthing counterfeiters, and those who rob the mails or infringe the revenue laws. The British government has established in London a force of detectives known as Scotland Yard men.

There are private detective establishments in all large cities, the best-known of these being the Pinkerton bureau, which has offices in several cities of the United States under the style of the Pinkerton National Detective Agency. This agency and similar bureaus make a business of supplying detectives to any one who will pay for the work, usually to get evidence in civil or criminal suits.

The detective achieves success by studying the ways of lawbreakers, and becoming acquainted with the haunts of the men he seeks. For instance, William Pinkerton, of Chicago, made an exhaustive study of the class of tramps who rob country stores and post-offices, and blow off the doors of safes. Their own name for their class is "yeggmen," and the only way to know them thoroughly is to become one of them for a time, to live as they do, and thus secure their confidence, and gain familiarity with their system of exchanging information. These yeggmen had a habit of registering on the tank houses of railway stations, where they would write the names by which they were known, with the date, and the direction they were going. Doubtless this practice has changed for some other, since the detectives became familiar with it, and used their knowledge to lodge various bad characters behind the bars.

Those detectives who achieve the best results make a specialty of one line of work, with which they become perfectly familiar. In a city like New York there is on the detective force at least one man familiar with the ways of each of the principal class of crooks. If a pickpocket is wanted, the man familiar with that work is supposed to have a pretty good idea what pickpockets are in town, and where they can be located; if he be an extra good detective, he will also be able to form a judgment from the nature of a steal, who are most likely to have been the thieves. It is this sort of knowledge that makes possible the quick detection of criminals.

The nature of detective work is such that very little authoritative matter has been printed about it. One of the first requisites of a detective is the power of keeping silence about the business or the cases on which he works. There are no printed reports and statistics of detective work that could be used in an encyclopædia. Most of the literature is of the nature of detective stories, told to amuse, and concealing instead of making clear real occurrences or facts. The detective at work is really a very different man from what he is pictured in the novel. He has usually had police experience, and is big and strong. These things, with a knowledge of the class of men he is to seek, are his stock in trade. One of the most common and difficult jobs that falls to his lot is the simple following of a man, whom he has located, but whom he does not wish to arrest, until he has traced him to his living place or some haunt where he can also expect to locate some companion or accomplice. To follow a man in an ordinary way is to invite him to escape, for if a crook in a city street suspects he is followed, he is almost certain to elude the pursuer. The detective who follows one must not stop whenever his man stops, but go right on and appear to pay no attention to him. He must know enough to jump on a car to get ahead of his man, and to be out of view; to dodge through a shortcut if there be one where he cannot lose his man, or to do any one of a dozen things promptly to serve his purpose. It is dangerous to take his eyes off the crook, and equally dangerous to let the crook have a good look at his shadower, so that if the following has to be kept up for any considerable distance it is a very trying piece of work.

The private detective has fallen into some disrepute in the United States, owing to employment on divorce cases or other matters where there is a temptation to manufacture evidence instead of finding it. Some judges have refused to credit the testimony of such detectives unless corroborated. In many cities private detectives are obliged to take out a license before they are allowed to follow the calling.

The Secret Service men whose duty it is to protect the mails have a simple method of locating thieves. Whenever a letter is lost, and a tracer sent after it, and the man found who last had knowledge of the letter, a pin is stuck in a map at the city where the letter was last seen. As more lost letters are searched for, the pins in this map begin to show central points where letters disappear with regularity. This shows about where there is regular thieving, and a detective has his field of work clearly pointed out to him, and by watching the men who handle the mail in that district he is usually sure of locating his man before very long. See also POLICE; SECRET SERVICE.

Determinants, an important class of algebraic functions which owe their origin to the attempt to formulate the solutions of general systems of simultaneous linear equations. Such a system of the second order is

$$a_1x+b_1y=\kappa_1, \quad a_2x+b_2y=\kappa_2;$$

from which

$$x=\frac{\kappa_1b_2-\kappa_2b_1}{a_1b_2-a_2b_1}, \qquad y=\frac{a_1\kappa_2-a_2\kappa_1}{a_1b_2-a_2b_1}.$$

The solution of the system of the third order,

$$a_ix+b_iy+c_iz=\kappa_i, \qquad (i=1, 2, 3),$$

in like manner gives

$$x=\frac{\kappa_1b_2c_3+\kappa_2b_3c_1+\kappa_3b_1c_2-\kappa_3b_2c_1-\kappa_1b_3c_2-\kappa_2b_1c_3}{a_1b_2c_3+a_2b_3c_1+a_3b_1c_2-a_3b_2c_1-a_1b_3c_2-a_2b_1c_3},$$

with expressions of similar form for y and z.

The functions appearing in the numerators and denominators of the expressions for the unknowns in the above, and in similar systems of equations, are determinants. They are formed in accordance with a general principle, the first precise statement of which was based upon the recognition of the two classes of permutations, as will presently be explained.

2. It is shown in algebra (*q.v.*) that the number of permutations of n elements arranged non-cyclically is $n(n-1)\ldots 2\cdot 1\equiv n!$. Any two elements, whether adjacent or not, standing in their natural order in a permutation constitute a permanence; standing in an order the reverse of the natural, an inversion. Thus, in the per-

permutations of a and b the permanences are ba, ac, ab; the inversions are ab, ba, bc, ac, cb, ca.

In permutations of any set of elements are classified, as to class, in two categories, viz., the positive, in which the number of inversions is even, and the negative, in which the number is odd. When the elements are arranged in the natural order the number of inversions is zero, which is even.

3. Interchanging two adjacent elements, a and a', of a permutation changes its class. For, if aa' is a permanence, $a'a$ is an inversion and *vice versa*, and the interchange either introduces or destroys an inversion. When the two elements interchanged are non-adjacent let the number of elements between them be q and represent these, in the aggregate, by Q. As in the preceding case the interchange has no effect upon the relation of a and a' to the elements preceding or following aQa'. The arrangement Qaa' may now be obtained by interchanging a with each of the q elements of Q in turn, after which a' may be moved to the first place by successive interchanges with the $q+1$ elements of Qa. Hence, the total number of interchanges of adjacent elements involved in the transition from the order aQa' to the order $a'Qa$ is $2q+1$, an odd number, from which follows the important theorem: The interchange of any two elements of a permutation changes its class.

Of any complete set of permutations one half are positive and one half negative.

4. Assume n^2 elements arranged in a square array thus:

$$\begin{vmatrix} a_1'a_1'' & \dots & a_1^{(n)} \\ a_2'a_2'' & \dots & a_2^{(n)} \\ \dots\dots\dots & & \\ a_n'a_n'' & \dots & a_n^{(n)} \end{vmatrix}$$

In this array the position of any element is shown by its indices. For example, a_5''' is in the third column and the fifth row. The diagonal through a_1', a_2'', $\dots$ $a_n^{(n)}$ is called the principal diagonal; that through a_n', a_{n-1}'', $\dots$ $a_1^{(n)}$ the secondary diagonal; the position occupied by a_1' the leading position.

The above array, inclosed by vertical bars as shown, is used to represent the determinant of its n^2 elements. This function may now be defined.

Write down the product of the n elements on the principal diagonal, arranging them in the natural order, thus: $a_1'a_2''a_3''' \dots a_n^{(n)}$. This is the principal term of the determinant. Now permute the subscripts of the principal term in every possible way, leaving the superscripts undisturbed. To such of the $n!$ resulting terms as involve the positive permutations of the subscripts give the plus sign; to those involving the negative permutations, the minus sign. The algebraic sum of all the terms thus obtained is the determinant represented by the given array.

Applying the process to the determinant array of the second order, there results

$$\begin{vmatrix} a_1'a_1'' & a_1'a_2'' \\ a_2'a_2'' & a_2'a_1'' \end{vmatrix};$$

while that of the third order gives

$$\begin{vmatrix} a_1'a_1''a_1''' \\ a_2'a_2''a_2''' \\ a_3'a_3''a_3''' \end{vmatrix} = a_1'a_2''a_3''' - a_1'a_3''a_2''' + a_2'a_3''a_1''' - a_2'a_1''a_3''' + a_3'a_1''a_2'' - a_3'a_2''a_1'''.$$

Each term of a determinant thus contains a single element from each column and each row of its array and is, therefore, a homogeneous function of its elements.

5. The expansion of the array of the second order may be written out at a glance. The process is less obvious, but still simple, for the array of the third order. It is as follows, the columns being, in this instance, ranked alphabetically instead of by indices: Beneath the square array write the first and second rows as shown in the figure. Then form the six products, each of three elements, traversed by one of the six oblique lines, applying the signs as indicated. The aggregate of terms thus obtained is the required expansion, as may readily be verified.

The reader will now do well to note how the values of the systems of unknowns x, y, and r, y, z, obtained at the outset, may be written in the notation of determinants.

No such direct methods as the above are available for the expansion of determinant arrays of higher orders, but these will be considered further on. See 13.

6. In writing determinants it is often convenient to use a double-subscript notation, the first subscript designating the row and the second the column to which the element belongs. Thus the element a_{35} stands in the third row and the fifth column. When the elements are merely symbolic it is customary to write only the principal term between the vertical bars. In this, which is called the umbral notation, the determinant of the nth order is

$$|a_1'a_2'' \dots a_n^{(n)}| \quad \text{or} \quad |a_{11}a_{22} \dots a_{nn}|;$$

which are often further abridged to $|a_1^{(n)}|$ and $|a_{1,n}|$ respectively.

Thus far the economy of the notation of determinants is scarcely apparent. Specific forms of higher order have, however, been purposely avoided. It is only necessary to write out the expansion of an array of the fourth order, which includes $4! = 24$ terms each of the fourth degree, to understand the necessity of a general theory of such forms. Determinants of even the fifth and sixth orders would be, if written out in full, quite beyond manipulation; while the complete expansion of

$$|a_1'a_2''a_3'''a_4^{\text{IV}}a_5^{\text{V}}a_6^{\text{VI}}a_7^{\text{VII}}a_8^{\text{VIII}}a_9^{\text{IX}}a_{10}^{\text{X}}a_{11}^{\text{XI}}a_{12}^{\text{XII}}|,$$

and such functions are not at all uncommon, would fill over a thousand closely printed volumes like the present! Yet, by means of the theory of determinants, such expressions are not only intelligible but manageable. The general properties of determinants will now be considered.

7. Any term of the development of $|a_1^{(n)}|$ may be written

$$\pm a_h'a_i''a_j''' \dots a_l^{(n)}. \qquad (a)$$

Designate by u the number of inversions in the permutation $hij \dots l$ and by v the number of interchanges of two elements necessary to bring the given term into the form

$$\pm a_1^{(p)}a_2^{(q)}a_3^{(r)} \dots a_n^{(t)}. \qquad (b)$$

Obviously u and v are either both even or both odd; but the permutation $pqr \dots t$ is positive or negative, according as v is even or odd, and the term will, therefore, have the same sign

whether it be determined by the permutation of the subscripts of (a) or by that of the superscripts of (b). It follows that the development of a determinant may be obtained by permuting the superscripts and writing the signs of the terms in accordance with these permutations, instead of using the subscripts as already explained. Passing from one of these methods of development to the other is equivalent to changing each column of the array into a row of the same rank and *vice versa*. Hence, a determinant is not altered by changing the rows into corresponding columns and the columns into corresponding rows. Any statement made with reference to the rows of a determinant must, therefore, be equally true with respect to the columns. Rows and columns are alike called lines.

8. If any two parallel lines of a determinant be interchanged the determinant will be changed only in sign. For, interchanging two lines is the same as interchanging, in each term of the expansion, the indices corresponding to these lines. This reverses the sign of each term and therefore that of the whole determinant.

The element $a_\kappa^{(s)}$ may be transferred to the leading position by interchanging the κth row with the $(\kappa-1)$ preceding rows and the sth column with the $(s-1)$ preceding columns. This being done, the resulting determinant must take the sign factor $(-1)^{\kappa+s}$.

A determinant having two parallel lines identical is equal to zero; for the interchange of these identical lines reverses the sign without altering the value of the function.

9. A determinant having a line of elements each the sum of two or more quantities can be expressed as a sum of two or more determinants. Let

$$\Delta \equiv \begin{vmatrix} a_1(b_1+b_1'-b_1''\pm\dots)c_1\dots \\ a_2(b_2+b_2'-b_2''\pm\dots)c_2\dots \\ a_3(b_3+b_3'-b_3''\pm\dots)c_3\dots \\ \dots\dots\dots\dots \end{vmatrix}$$

be such a determinant. Then, writing

$$B_i \equiv b_i+b_i'-b_i''\pm\dots,$$

any term of the development of Δ is of the form

$$\pm a_pB_qc_r\dots = \pm a_pb_qc_r\dots \pm a_pb_q'c_r\dots \mp a_pb_q''c_r\dots\pm\dots$$

The terms of Δ are obtained by permuting the subscripts $p, q, r, \dots$ of $a_pB_qc_r\dots$. Permuting simultaneously the same subscripts in the second member and giving to each term thus obtained its appropriate sign, there results

$$|a_1B_2c_3\dots| = |a_1b_2c_3\dots| + |a_1b_2'c_3\dots| - |a_1b_2''c_3\dots| \pm \dots,$$

which proves the theorem.

10. Multiplying each element of a given line of a determinant by a given factor multiplies the determinant by that factor; for each term of the expansion contains a single element from the given line. The common factor thus appears once and only once in each term of the expansion, and the determinant is, therefore, multiplied by that factor.

In the same way it may be shown that a determinant having a line of zeros is equal to zero. It also follows that if the elements of any line have a common ratio to the corresponding elements of any parallel line the determinant vanishes.

11. If each element of a line of a determinant be multiplied by a given factor and the product added to the corresponding element of any parallel line the value of the determinant will not be changed. This follows directly from 9 and 10. Thus

$$\begin{vmatrix} a_{11}a_{12}a_{13}\dots a_{1n} \\ \dots\dots\dots \\ a_{n1}a_{n2}a_{n3}\dots a_{nn} \end{vmatrix} = \begin{vmatrix} a_{11}a_{12}(a_{13}+ma_{11})\dots a_{1n} \\ \dots\dots\dots\dots\dots \\ a_{n1}a_{n2}(a_{n3}+ma_{n1})\dots a_{nn} \end{vmatrix}$$

12. The terms of $|a_1^{(n)}|$ which contain the element a_1' are those found in the expansion of

$$\begin{vmatrix} a_1' & 0 & 0 & \dots & 0 \\ a_2'a_2''a_2''' & & & \dots & a_2^{(n)} \\ \dots & & & \dots & \dots \\ a_n'a_n''a_n''' & & & \dots & a_n^{(n)} \end{vmatrix}. \qquad (a)$$

For if, in forming any term, another element than a_1' be taken from the first column an element zero must be taken from the first row, and the term vanishes. It may readily be shown that the determinant (a) is equal to

$$a_1' \begin{vmatrix} a_2''a_2''' & \dots & a_2^{(n)} \\ \dots & \dots & \dots \\ a_n''a_n''' & \dots & a_n^{(n)} \end{vmatrix}, \qquad (b)$$

which is therefore the aggregate of the terms of $|a_1^{(n)}|$, $(n-1)!$ in number, which contain the element a_1'.

The determinant factor of order $(n-1)$ by which the element a_1' is multiplied in (b) is called the co-factor of that element in $|a_1^{(n)}|$. It may be obtained from the given determinant by deleting the first column and the first row.

The co-factor of any element $a_\kappa^{(s)}$ may be found in the same manner after transposing this element to the leading position. But this transposition multiplies the determinant by the sign factor $(-1)^{\kappa+s}$. Hence, to find the co-factor of $a_\kappa^{(s)}$, delete its row and its column and give the resultant determinant the

$$\begin{pmatrix}\text{positive}\\\text{negative}\end{pmatrix} \text{sign when } (\kappa+s) \text{ is } \begin{pmatrix}\text{even}\\\text{odd}\end{pmatrix}.$$

The co-factor thus obtained is represented by $A_\kappa^{(s)}$, the sign factor $(-1)^{\kappa+s}$ being intrinsic. For example, the co-factors of the elements of the second row of $|a_1'a_2''a_3'''|$ are

$$A_2' \equiv -\begin{vmatrix} a_1''a_1''' \\ a_3''a_3''' \end{vmatrix}, \quad A_2'' \equiv \begin{vmatrix} a_1'a_1''' \\ a_3'a_3''' \end{vmatrix}, \quad A_2''' \equiv -\begin{vmatrix} a_1'a_1'' \\ a_3'a_3'' \end{vmatrix}.$$

13. The aggregates of terms containing the elements $a_\kappa', a_\kappa'', \dots a_\kappa^{(n)}$ of the determinant $|a_1^{(n)}|$ are, respectively,

$$a_\kappa'A_\kappa', \quad a_\kappa''A_\kappa'', \dots a_\kappa^{(n)}A_\kappa^{(n)}.$$

Each of these n aggregates includes $(n-1)!$ terms of $|a_1^{(n)}|$, no one of which appears in any of the others. In all of them, then, there are $n(n-1)!$ or $n!$ different terms of the determinant, which is the whole number. Hence

$$|a_1^{(n)}| = a_\kappa'A_\kappa' + a_\kappa''A_\kappa'' + \dots + a_\kappa^{(n)}A_\kappa^{(n)}. \qquad (1)$$

Similarly,

$$|a_1^{(n)}| = a_1^{(s)}A_1^{(s)} + a_2^{(s)}A_2^{(s)} + \dots + a_n^{(s)}A_n^{(s)} \qquad (2)$$

Any determinant may, by means of either (1) or (2), be resolved into determinants of an order one lower and thus, since $A_\kappa', \dots A_\kappa^{(n)}$ or

$A_1^{(s)} \ldots A_n^{(s)}$ are themselves determinants, it may ultimately be expressed in terms of determinants of the third or second order, which may readily be expanded (see 5).

14. If the hth and κth rows of $|a_1^{(n)}|$ are identical the elements a_h', a_h'', $\ldots a_h^{(n)}$ in formula (1) may be replaced by $a_h', a_h'', \ldots a_h^{(n)}$, respectively. But in this case the value of the determinant is zero. Hence, h and κ being different,

$$a_h' A_\kappa' + a_h'' A_\kappa'' + \ldots + a_h^{(n)} A_\kappa^{(n)} = 0. \qquad (3)$$

Likewise r and s being different,

$$a_1^{(r)} A_1^{(s)} + a_2^{(r)} A_2^{(s)} + \ldots + a_n^{(r)} A_n^{(s)} = 0. \qquad (4)$$

15. The determinant of order $(n-1)$ obtained by deleting the κth row and the sth column of $\Delta = |a_1^{(n)}|$ is called the minor of the determinant with respect to the element $a_\kappa^{(s)}$, and is written $\Delta_{(\kappa)}^{(s)}$. Obviously, by what precedes,

$$A_\kappa^{(s)} = (-1)^{\kappa+s} \cdot \Delta_{(\kappa)}^{(s)}.$$

If two rows, the hth and κth, and two columns, the rth and sth, are deleted the result is written $\Delta_{(h,\kappa)}^{(r,s)}$, and is called a minor of the second order. Minors of lower orders may be obtained in a similar manner and expressed by a similar notation.

Any mth minor of a given determinant and the determinant of the m^2 elements at the intersection of the rows and columns deleted in forming it are called, with respect to each other, complementary minors. The determinant may be expressed in terms of products of pairs of complementary minors, a method of expansion due to Laplace. Formulæ (1) and (2) are special cases of the method. Its general statement is somewhat complicated.

16. The principles thus far developed will now be applied to the solution of systems of simultaneous linear equations; the process which, as stated at the outset, led to the discovery and investigation of determinants. Assume the system of three equations

$$a_i x + b_i y + c_i z = \kappa_i \qquad (i = 1, 2, 3.)$$

In the determinant $|\kappa_1 b_2 c_3|$, let the elements κ_1, κ_2, κ_3 be replaced by the equal quantities appearing in the first members of the given equations. The two determinants now in hand are equal to each other; thus

$$\begin{vmatrix} a_1x + b_1y + c_1z & b_1 & c_1 \\ a_2x + b_2y + c_2z & b_2 & c_2 \\ a_3x + b_3y + c_3z & b_3 & c_3 \end{vmatrix} = \begin{vmatrix} \kappa_1 & b_1 & c_1 \\ \kappa_2 & b_2 & c_2 \\ \kappa_3 & b_3 & c_3 \end{vmatrix}.$$

But the first member of this equation may be separated into the determinants (see 9 and 10)

$$x|a_1b_2c_3|, \quad y|b_1b_2c_3|, \quad \text{and} \quad z|c_1b_2c_3|,$$

the second and third of which are, by 8, equal to zero. Hence

$$x|a_1b_2c_3| = |\kappa_1b_2c_3|;$$

or, explicitly (see 1),

$$x = \frac{\begin{vmatrix} \kappa_1 & b_1 & c_1 \\ \kappa_2 & b_2 & c_2 \\ \kappa_3 & b_3 & c_3 \end{vmatrix}}{\begin{vmatrix} a_1 & b_1 & c_1 \\ a_2 & b_2 & c_2 \\ a_3 & b_3 & c_3 \end{vmatrix}}.$$

Similarly, by starting with the determinants $|a_1\kappa_2c_3|$ and $|a_1b_2\kappa_3|$, respectively, the values of y and z are found to be

$$y = \frac{|a_1\kappa_2c_3|}{|a_1b_2c_3|}, \qquad z = \frac{|a_1b_2\kappa_3|}{|a_1b_2c_3|}.$$

It will be noted that the values of the unknowns have for a common denominator the determinant of the coefficients of the given equation; while the numerator is, in each case, obtained from the denominator by replacing the column of coefficients of the unknown in question by the column of absolute terms. The method is applicable to linear systems of any order.

17. When the number of given equations is greater than the number of unknowns their consistency obviously depends upon some definite relation among the known elements. Let

$$a_i x + b_i y = \kappa_i \qquad (i = 1, 2, 3)$$

be such a redundant system.

Solving the first two of these equations gives (see 1)

$$x = \frac{\begin{vmatrix} \kappa_1 & b_1 \\ \kappa_2 & b_2 \end{vmatrix}}{\begin{vmatrix} a_1 & b_1 \\ a_2 & b_2 \end{vmatrix}}, \qquad y = \frac{\begin{vmatrix} a_1 & \kappa_1 \\ a_2 & \kappa_2 \end{vmatrix}}{\begin{vmatrix} a_1 & b_1 \\ a_2 & b_2 \end{vmatrix}}.$$

If, now, the three equations are consistent, these values must also satisfy

$$a_3 x + b_3 y = \kappa_3;$$

whence, substituting the above values and clearing of fractions,

$$a_3 \begin{vmatrix} \kappa_1 & b_1 \\ \kappa_2 & b_2 \end{vmatrix} + b_3 \begin{vmatrix} a_1 & \kappa_1 \\ a_2 & \kappa_2 \end{vmatrix} = \kappa_3 \begin{vmatrix} a_1 & b_1 \\ a_2 & b_2 \end{vmatrix};$$

or, by 8, and (1)

$$a_3 \begin{vmatrix} b_1 & \kappa_1 \\ b_2 & \kappa_2 \end{vmatrix} - b_3 \begin{vmatrix} a_1 & \kappa_1 \\ a_2 & \kappa_2 \end{vmatrix} + \kappa_3 \begin{vmatrix} a_1 & b_1 \\ a_2 & b_2 \end{vmatrix} = \begin{vmatrix} a_1 & b_1 & \kappa_1 \\ a_2 & b_2 & \kappa_2 \\ a_3 & b_3 & \kappa_3 \end{vmatrix} = 0. \qquad (5)$$

The above process being generalized, it appears that the condition that n linear equations between $(n-1)$ unknowns constitute a consistent system is that the determinant of the coefficients and absolute terms be zero.

18. Consider now the homogeneous linear equations

$$a_i x + b_i y + c_i z = 0. \qquad (i = 1, 2, 3)$$

Solving these equations as in 16 gives

$$x = y = z = \frac{0}{|a_1b_2c_3|} = 0,$$

unless

$$|a_1b_2c_3| = 0; \qquad (6)$$

in which case each unknown becomes $\frac{0}{0}$, which may have any value whatever. But the given equations may be written

$$a_i \frac{x}{z} + b_i \frac{y}{z} + c_i = 0; \qquad (i = 1, 2, 3)$$

any two of which will determine the ratios $\frac{x}{z}$ and $\frac{y}{z}$. If these three equations form a con-

sistent system in $\frac{x}{z}$ and $\frac{y}{z}$, however, the condition expressed by (6) holds good (see 17); that is to say, the given equations consistently determine the ratios $x:y:z$ only when the determinant of the coefficients vanishes. In this case, as may readily be shown,

$$\begin{aligned} x:y:z:: & A_1:B_1:C_1 \\ :: & A_2:B_2:C_2 \\ :: & A_3:B_3:C_3. \end{aligned} \qquad (7)$$

When the determinant of the coefficients does not vanish the equations are satisfied only by the values $x=y=z=0$. In general:

The condition that n homogeneous linear equations between n unknowns form a consistent system, for other than zero values of the unknown, is that the determinant of the coefficients be zero.

The relation expressed by (7) may also be generalized thus: In any determinant which equals zero, the co-factors of the elements of any line are proportional to the co-factors of the corresponding elements of any parallel line.

The determinants (5) and (6) are called resultants or eliminants, each being the result of eliminating the unknowns from the system of equations from which it is derived.

19. Again let there be r homogeneous linear equations involving n unknowns, r being greater than n, thus:

$$a_i'x'+a_i''x''+\ldots+a_i^{(n)}x^{(n)}=0. \qquad (i=1, 2, \ldots n_1, \ldots r).$$

The consisteney of these equations requires that every determinant of the nth order, formed by selecting n rows from the array whose elements are the coefficients written in order, shall be zero. If these conditions are fulfilled the fact is expressed by writing

$$\left\| \begin{matrix} a_1'a_2' & \ldots a_n' & \ldots a_r' \\ a_1''a_2'' & \ldots a_n'' & \ldots a_r'' \\ \cdot\ \cdot\ \cdot\ \cdot\ \cdot\ \cdot & & \\ a_1^{(n)}a_2^{(n)} & \ldots a_n^{(n)} & \ldots a_r^{(n)} \end{matrix} \right\| = 0;$$

the change of rows into columns being purely arbitrary. The above expression is called a rectangular array or a matrix.

20. Let it be required to eliminate the unknowns from the equations

$$ax^2+bxy+cy^2=0, \quad \alpha x+\beta y=0.$$

Multiplying the second equation, first by y and then by x, there become available three equations involving the three unknowns x^2, xy, y^2, as follows:

$$\begin{aligned} ax^2+bxy+cy^2 &= 0, \\ \alpha xy+\beta y^2 &= 0, \\ \alpha x^2+\beta xy &= 0. \end{aligned}$$

The eliminant of this system, if consistent, is

$$\begin{vmatrix} a & b & c \\ 0 & \alpha & \beta \\ \alpha & \beta & 0 \end{vmatrix} = 0.$$

If the given equations be inconsistent this determinant does not vanish.

This process, due to Sylvester, may readily be generalized. It is known as the dialytic method of elimination.

21. The product of two determinants may be most readily obtained as an eliminant. To this end let

$$a_{11}x_1+a_{12}x_2=0, \quad a_{21}x_1+a_{22}x_2=0 \qquad (a)$$

be linearly transformed by substituting

$$x_1=b_{11}w_1+b_{21}w_2, \quad x_2=b_{12}w_1+b_{22}w_2; \qquad (b)$$

the result being

$$\left.\begin{aligned} (a_{11}b_{11}+a_{12}b_{12})w_1+(a_{11}b_{21}+a_{12}b_{22})w_2 &= 0, \\ (a_{21}b_{11}+a_{22}b_{12})w_1+(a_{21}b_{21}+a_{22}b_{22})w_2 &= 0. \end{aligned}\right\} \qquad (c)$$

Now the condition that equations (c) be consistent is that the determinant

$$\begin{vmatrix} a_{11}b_{11}+a_{12}b_{12} & a_{11}b_{21}+a_{12}b_{22} \\ a_{21}b_{11}+a_{22}b_{12} & a_{21}b_{21}+a_{22}b_{22} \end{vmatrix} \qquad (d)$$

shall vanish. But they may be consistent because equations (a) are so, in which case

$$\begin{vmatrix} a_{11}a_{12} \\ a_{21}a_{22} \end{vmatrix} = 0; \qquad (e)$$

or, this condition failing, and (a) thus having no solution other than $x=0=y$, (c) will still be consistent if equations (b) are so; that is, if

$$\begin{vmatrix} b_{11}b_{12} \\ b_{21}b_{22} \end{vmatrix} = 0. \qquad (f)$$

The vanishing of either of the determinants (e) or (f), therefore, causes (d) to vanish; from which it follows that the determinants (e) and (f) are factors of (d). The only other factor is numerical and may readily be shown, by comparing coefficients, to be unity. Hence,

$$\begin{vmatrix} a_{11}a_{12} \\ a_{21}b_{22} \end{vmatrix} \cdot \begin{vmatrix} b_{11}b_{12} \\ b_{21}b_{22} \end{vmatrix} = \begin{vmatrix} a_{11}b_{11}+a_{12}b_{12} & a_{11}b_{21}+a_{12}b_{22} \\ a_{21}b_{11}+a_{22}b_{12} & a_{21}b_{21}+a_{22}b_{22} \end{vmatrix}.$$

The same method may be applied to the formation of the product of any two determinants of the same order. The operation may be described as follows:

To form the product $|p_{1n}|$ of two determinants $|a_{1n}|$ and $|b_{1n}|$, first connect by plus signs the elements of the rows of both $|a_{1n}|$ and $|b_{1n}|$. Then place the first row of $|a_{1n}|$ upon each row of $|b_{1n}|$ in turn and let each two elements as they touch become products. This is the first row of $|p_{1n}|$. Perform the same operation upon $|b_{1n}|$ with the second row of $|a_{1n}|$ to obtain the second row of $|p_{1n}|$, etc. Any element of this product is

$$p_{\kappa s}=a_{\kappa 1}b_{s_1}+a_{\kappa 2}b_{s_2}+\ldots+a_{\kappa n}b_{sn}. \qquad (8)$$

The product may also be formed by columns instead of by rows as above.

22. The operation just described may be applied to form what is conventionally called the product of two rectangular arrays of the same dimensions. Let these be

$$\left.\begin{matrix} a_{11}a_{12} \\ a_{21}a_{22} \\ a_{31}a_{32} \end{matrix}\right\} \quad \text{and} \quad \left\{\begin{matrix} b_{11}b_{12} \\ b_{21}b_{22} \\ b_{31}b_{32} \end{matrix}\right.$$

Forming the product by rows gives

$$\begin{vmatrix} a_{11}b_{11}+a_{12}b_{12} & a_{11}b_{21}+a_{12}b_{22} & a_{11}b_{31}+a_{12}b_{32} \\ a_{21}b_{11}+a_{22}b_{12} & a_{21}b_{21}+a_{22}b_{22} & a_{21}b_{31}+a_{22}b_{32} \\ a_{31}b_{11}+a_{32}b_{12} & a_{31}b_{21}+a_{32}b_{22} & a_{31}b_{31}+a_{32}b_{32} \end{vmatrix}$$

If this product array be interpreted as a determinant it can only be zero; for it is the product of the two determinants formed by writing a column of zeros after one of the given rectangular arrays and a column of elements arbitrarily chosen after the other. An entirely different result would have been obtained had the product been formed by columns instead of by rows.

23. The result of replacing each element of a

determinant by its co-factor is called the reciprocal of the determinant. Thus the reciprocal of

$$\Delta = \begin{vmatrix} a_{11} & \dots & a_{1n} \\ \dots & \dots & \dots \\ a_{n1} & \dots & a_{nn} \end{vmatrix} \text{ is } \Delta' = \begin{vmatrix} A_{11} & \dots & A_{1n} \\ \dots & \dots & \dots \\ A_{n1} & \dots & A_{nn} \end{vmatrix}.$$

Multiplying and applying the formulæ (2) and (4) to the elements of the product, gives

$$\Delta \Delta' = \begin{vmatrix} \Delta & 0 & \dots \\ 0 & \Delta & \dots \\ \dots & \dots & \dots \end{vmatrix} = \Delta^n, \quad \text{of order } n;$$

whence $\Delta \cdot \Delta' = \Delta^n$, or $\Delta' = \Delta^{n-1}$.

That is, the reciprocal of a determinant of the nth order is equal to its $(n-1)$th power.

Reciprocal determinants are a special case of compound determinants, whose elements are minors variously derived from one or more given arrays.

24. The application of determinants to the study of geometry and pure analysis has led to the recognition and investigation of numerous special forms, some of which will be defined and their most characteristic properties stated without demonstration.

Among the more important are the forms known as symmetrical determinants. In these any two elements symmetrically placed with respect to the principal diagonal, known as conjugate elements, have the same absolute value. If $a_r^{(s)} = a_s^{(r)}$ the determinant is described as simply symmetrical. If $a_r^{(s)} = -a_s^{(r)}$, a condition which cannot apply to the elements of the principal diagonal, unless these be zero, it is said to be gauche or skew. When the diagonal elements are zeros and $a_r^{(s)} = -a_s^{(r)}$ the determinant is skew-symmetric. It is very easy to show that a skew-symmetric determinant of odd order is equal to zero. When of even order, however, it is equal to the square of a certain rational function of its elements known as the Pfaffian. These functions are expressed by triangular arrays; thus

$$\begin{vmatrix} 0 & a & n & m \\ -a & 0 & b & l \\ \cdot & -b & 0 & c \\ -m & -l & \cdot & 0 \end{vmatrix} = (ca - nl + bm)^2 = \begin{vmatrix} a & m \\ b & l \\ c & \cdot \end{vmatrix}^2.$$

The properties of Pfaffians are strikingly analogous to those of determinants.

25. Determinants all of whose elements are zeros except those of the principal diagonal and the adjacent minor diagonals above and below, and in which each element of one of these minor diagonals is -1, are called continuants. They were so named by Muir because of their connection with the theory of continued fractions. If q_i be the number of terms in the expansion of the continuant of order i, it may be shown that $q_n = q_{n-1} + q_{n-2}$; a difference equation, the solution of which is

$$q_n = \frac{(1+\sqrt{5})^{n+1} - (1-\sqrt{5})^{n+1}}{2^{n+1}\sqrt{5}}.$$

26. A determinant in which the elements of the first row are functions of a given variable, the corresponding elements of the second row the same function of another variable, etc., is called an alternant. If the functions used as elements are powers of the variables it is described as a simple alternant. Such a determinant is divisible by the difference product of its variables, the quotient being a symmetrical function of these variables. Thus

$$\begin{vmatrix} 1 & x & x^3 \\ 1 & y & y^3 \\ 1 & z & z^3 \end{vmatrix} = (y-z)(z-x)(x-y)(x+y+z).$$

27. When $y_1, y_2, \dots y_n$ are functions, each of $x_1, x_2, \dots, x_n$, the determinant

$$\begin{vmatrix} \partial y_1 / \partial x_1 & \partial y_1 / \partial x_2 & \dots & \partial y_1 / \partial x_n \\ \dots & \dots & \dots & \dots \end{vmatrix} = \frac{d(y_1 \dots n)}{d(x_1 \dots n)}$$

is called the Jacobian of the given functions, a name given by Sylvester. There is a complete analogy between the Jacobian and the ordinary differential coefficient $\frac{dy}{dx}$, which Bertrand has made the basis of another definition of these functions. Thus, letting

$$\Delta_i x_1, \Delta_i x_2, \dots, \Delta_i x_n \quad (i = 1, 2, \dots n)$$

be n distinct sets of increments given to $x_1, x_2, \dots, x_n$, and

$$\Delta_i y_1, \Delta_i y_2, \dots, \Delta_i y_n, \quad (i = 1, 2, \dots n)$$

the corresponding increments of $y_1, y_2, \dots, y_n$, then is

$$\frac{\begin{vmatrix} \Delta_1 y_1 & \Delta_2 y_2 & \dots & \Delta_n y_n \end{vmatrix}}{\begin{vmatrix} \Delta_1 x_1 & \Delta_2 x_2 & \dots & \Delta_n x_n \end{vmatrix}} = \frac{d(y_1 \dots n)}{d(x_1 \dots n)}.$$

If the functions be subjected to linear transformation the Jacobian is multiplied by a constant factor or modulus, which is the determinant of the coefficients of the transformation. The Jacobian is thus a covariant of the functions from which it is derived. See INVARIANTS AND COVARIANTS.

If the Jacobian vanishes the functions are not independent, and conversely.

28. The Jacobian of the partial differential coefficients of a function, taken with respect to its several variables, is called the Hessian of the function. The Hessian is a symmetrical determinant.

Thus, the given function being the ternary quadric,

$$w = ax^2 + by^2 + cz^2 + 2fyz + 2gzx + 2hxy,$$

$$H(w) = \begin{vmatrix} a & h & g \\ h & b & f \\ g & f & c \end{vmatrix};$$

a determinant, which in this instance is also known as the discriminant, for the reason that its vanishing is the condition that w be resolvable into linear factors.

Like the Jacobian the Hessian is a covariant. Both were originally called functional determinants.

29. The theory of determinants has two notable extensions which will be explained, though little more than the definition of the functions suggested can be undertaken in the present article.

Just as n^2 elements may be arranged as a square array with two sets of parallel lines, so may n^3 elements be arranged in the form of a cube so as to lie in three sets of parallel planes. These three sets of planes may be called strata, planes, and sections, the last two corresponding respectively to the rows and columns of the square array lying in any given stratum. An element of such an array may be represented by $a_{\eta,\kappa,s}$, where η is the number of its stratum, κ of its plane, and s of its section. Then $|a_{\eta,\kappa,s}|$ represents a function known as a cubic determi-

nant. Its principal term is $a_{111}a_{222}\ldots a_{nnn}$, and the others are obtained as follows: Permute the third suffixes and in each of the $n!$ products obtained permute the second suffixes, thus obtaining $(n!)^2$ products. Then apply to each product a sign factor which is the product of the sign factor appropriate to the permutation of the third suffixes by that appropriate to the permutation of the second. The aggregate of terms thus obtained is the cubic determinant.

The sign of the cubic-determinant is changed by the interchange of two planes or two sections; but the interchange of two strata has no effect.

There are also determinants whose arrays can be represented only in hyper-space (see HYPER-SPACES, GEOMETRY OF), but whose elements may be defined by means of multiple suffixes as above. Such determinants are known as hyper-determinants.

30. In the array

$$\begin{vmatrix} a_{-\lambda,-\rho} & \ldots & a_{-\lambda,0} & \ldots & a_{-\lambda,\sigma} \\ \cdot & \cdot & \cdot & \cdot & \cdot \\ a_{0,-\rho} & \ldots & a_{0,0} & \ldots & a_{0,\sigma} \\ \cdot & \cdot & \cdot & \cdot & \cdot \\ a_{\mu,-\rho} & \ldots & a_{\mu,0} & \ldots & a_{\mu,\sigma} \end{vmatrix},$$

letting $\lambda+\mu=n=\rho+\sigma$, the given array represents a determinant of order $(n+1)$. If now n increase indefinitely, λ, μ on the one hand and ρ, σ on the other also becoming indefinitely large, while maintaining the above relation to n, the determinant may approach a definite limiting value, it may become indeterminate, or it may become infinite. Determinants of infinite order, as here defined, present certain analogies to infinite series.

History and Bibliography.—The first definite reference to determinants is to be found in a manuscript of Leibnitz, left unpublished at the time of his death. His later development of the idea is embodied in a communication to De l'Hospital (1693) in which he explains the formation of the eliminant of a system of linear equations identical in form with that discussed in 17. In his notation he used double indices, representing the element $a_{\kappa\delta}$ by $(\kappa\delta)$ or by κ_δ. The next approach to the subject was made quite independently by Cramer (1750), who expounded a rule for writing out the values of the unknowns in a system of linear equations, in which he recognized the two classes of permutations as given in 2. This rule found instant favor and the development of the theory of determinants has since been almost continuous.

The first attempt at a formal exposition of the theory was made by Vandermonde (1771). His treatment of the functions as independent of their connection with the process of elimination and his recognition of several of their more fundamental properties entitles him to be ranked as the real founder of the theory. Almost simultaneously Laplace gave the method, partly anticipated by Vandermonde, of expanding determinants in terms of complementary minors. The functions were called by him «resultants,» a term now used in the restricted sense explained in 18.

New applications of the functions were at once found by Lagrange (1773), principally in the domains of geometry and the theory of numbers. Their application was further extended by Gauss (1801), who used the word determinant to designate the discriminant of the ternary quadric (see 28). He also noted the significance of reciprocal determinants (see 23), and was on the verge of discovering the multiplication theorem. This theorem (see 21 and 22) was first given by Binet (1812), but its satisfactory proof is due to Cauchy.

Cauchy was the first to use the word determinant in its present sense. His memoir in the 'Jour. de l'ecole polytechnique' (1812) rounded the general theory of determinants into something like its present form. Jacobi early adopted the new calculus and greatly extended its field of usefulness. In his hands it became, not merely an indispensable system of notation, but a powerful instrument of research as well. His justly famous memoirs in 'Crelle's Journal' (1841) made the subject readily accessible and, since their publication, determinants have been freely used by mathematical writers without apology or explanation.

A new impulse was given through the study of linear transformations, in which Cayley and Sylvester led the way. The more recent developments relate mainly to special forms of determinants. Skew determinants and Pfaffians were developed by Cayley, in connection with the orthogonal transformation. He was the first writer to use the vertical bars enclosing the determinant array. Continuants were investigated by Sylvester, who also named and made much use of Jacobians and Hessians. Alternants, first recognized by Cauchy and studied by Jacobi, have been further discussed by Trudi, Nägelbach, and Garbieri. Important results relating to compound determinants were published by Schweins (1825), but these have been rediscovered and greatly extended by Sylvester, Reiss, Kronecker, and Picquet. Determinants of infinite order have been used by G. W. Hill in a memoir on the linear theory appearing in the 'Acta Math.,' vol. viii. Their properties have been investigated by Poincare, von Koch, and Cazzaniga. In recent years the arithmetical properties of determinants and the theory of elementary divisors have been discussed by H. J. S. Smith, Kronecker, Frobenius, and Weierstrass.

Muir's 'Theory of Determinants in the Historical Order of its Development' (London, 1890) is the 'standard work on the history of the subject down to 1841. The same author has also compiled a complete bibliography of determinants down to 1900 ('Quar. Jour. of Math.'). Spottiswoode (1851) prepared the first regular treatise. Other well-known texts are those of Baltzer (Leipzig, 1857); Günther (Erlangen, 1875); Dostor (Paris, 1877); Scott (Cambridge, 1880); Muir (London, 1882); Hanus (Boston, 1886); Weld (New York, 1893); Scott and Mathews (Cambridge, 1904).

LAENAS GIFFORD WELD,
Prof. of Mathematics and Astronomy,
State University of Iowa.

Determinative Mineralogy, that division of the science of mineralogy (q.v.) which treats of the identification of unknown minerals. The expert mineralogist is able to recognize at sight several hundred distinct species of minerals, and many varieties when the specimens brought to his notice are typical. Such ability is the result of much study and experimentation, as well as careful observation of the physical differences between the species. Some times the usually constant properties of certain minerals vary to

such an extent as to disguise the species. It is then necessary to make such tests as experience has proved are requisite in order to identify the mineral. Though the aid of an elaborate series of determinative tables is usually sought, it is always wise to make a few preliminary tests in order to learn what are some of the most prominent of the physical properties of the mineral. Quite often valuable suggestions as to the character of the mineral, and at times its identity, may be learned by testing its hardness, streak, or cleavage, or by taking its specific gravity, or by observing its crystal form, structure, lustre, color, and feel.

Hardness is a factor of prime importance in the determination of minerals. The number of exceedingly hard minerals is very small. If a mineral is not scratched by topaz, it must be some one of a dozen minerals, and these are usually differentiated with ease by other simple physical tests. Ruby is thus separated from garnet, while, if its crystal form is distinct, it may readily be distinguished from the very similar ruby spinel, which is nearly as hard. A knife-blade is all that is needed to prove that iron pyrites, or "fool's gold," is not true gold, for the latter is readily scratched by the blade, while pyrites is not. It is an excellent rule to invariably test the hardness of a mineral before making any other tests.

Streak (q.v.) is of importance with colored minerals and those having metallic lustre. The scarlet streak of cochineal-red cinnabar will instantly distinguish it from cuprite, which has the same color but a brownish-red to blood-red streak. The brown streak of manganite serves to distinguish it from pyrolusite, which has a black streak, while a test of their hardness shows that manganite is 4 and pyrolusite 2 to 2.5. The distinction between gold and pyrite is very marked, gold having a streak of the same color as the mass, while the streak of pyrite is greenish-black. This same greenish-black streak is, however, characteristic of copper pyrites, and its external color is quite similar to that of iron pyrites, but they are readily separated by the superior hardness of the iron pyrites. Such tests as these are not only most convenient in field work, but are at times conclusive. (See Mineralogy; Physical Crystallography.)

Cleavage is often an important aid in determinative work. If a lead-gray mineral of metallic lustre shows well-developed cubical cleavage, it may be safely assumed that it is galena. If a transparent mineral cleaves readily into octahedrons of large size, it is almost certainly fluorite. Sphalerite is the only mineral in which dodecahedral cleavage is highly perfect, while the excellent rhombohedral cleavage of calcite instantly distinguishes it from quartz, which it often resembles, and the separation is made conclusive by testing the hardness, which in calcite is 4 and in quartz 7.

Crystal form is one of the most important determinative factors. The characteristic cross twins of staurolite suffice to determine that species, which it would be difficult to recognize if massive. The trillings of cerussite easily separate it from anglesite, whose physical properties are very similar. Many of the zeolites and their common associates are recognized by their crystal form; thus analcite is isometric and generally in trapezohedrons, chabazite is rhombohedral, apophyllite is tetragonal. The "gridiron" structure of microcline as seen in thin sections under the microscope, which is due to twinning, serves effectually to differentiate it from all of the other feldspars. The importance of a knowledge of crystallography (q.v.) as an aid in determinative mineralogy cannot be overestimated.

Specific gravity is one of the least variable properties of minerals. Its accurate determination, therefore, may be the only test needed to positively identify a specimen. This fact is of immense importance to the jeweler, who constantly resorts to his specific gravity balance as his safest test for precious stones. Gold, too, may be thus identified, for no other yellow mineral has a specific gravity approaching it. Even the rough test of placing the unknown mineral in the palm of the hand and comparing it with about the same quantity of a known species may be suggestive as to the identity of the mineral. Thus rusty-yellow quartz sand may be instantly distinguished from the very similar but much heavier monazite sand.

While the examination of the physical properties of an unknown mineral, as above suggested, is of great value, there is but one way in which its identity can be fixed in all cases, and that is by the use of a series of determinative tables in which the mineral is referred successively from one large group to a smaller, until finally all have been eliminated but itself. The process is based largely on a series of chemical tests which, in almost all cases, give an insight into the character of the material. The scheme involves (1) the heating of a fragment in the forceps; (2) heating in a closed tube; (3) heating in an open tube; (4) heating on charcoal in the blowpipe flame; (5) fusion with fluxes on platinum wire. These processes are described under Blowpipe Analysis (q.v.).

While described species may be determined by the foregoing methods, it is at times desirable, and in the case of new species essential, to ascertain the exact proportions of the various ingredients which are present in the mineral; for this purpose it is necessary to resort to a complete quantitive analysis. See Chemical Analysis.

Bibliography.— Penfield's revision of Brush's 'Manual of Determinative Mineralogy'; Endlich, 'Manual of Qualitative Blowpipe Analysis and Determinative Mineralogy'; Frazer, 'Tables for the Determination of Minerals by Physical Properties; Crosby, 'Tables for the Determination of Common Minerals.'

George Letchworth English,
Mineralogist, New York City.

Determinate Problem, a problem in geometry which admits of a limited number of solutions, an indeterminate problem admitting of an indefinite number of solutions.

Deter'minism, a name applied by Sir William Hamilton to that system of philosophy which holds that the will is not a free agent, but is irresistibly determined by providential motives, that is, by motives furnished by Providence, which turn the balance in our mental deliberations in accordance with its views. Determinism is often mistakenly confused with materialism and atheism. It does not deny moral responsibility though holding a man cannot choose to act in a certain way while he

prefers with his whole nature to act in another way. This doctrine of the necessitarian philosophers expounds in short that whatever happens is entirely determined by antecedent causes.

Detlef, Karl, kärl dĕt'lĕf, pseudonym of Klara Bauer, German novelist: b. Swinemünde 23 June 1836; d. Breslau 29 June 1876. Her 'Indissoluble Bonds' (1877) and 'Must It Be?' (1872), are valuable and engrossing studies of character.

Detmold, dĕt'mōld, Germany, city, capital of Lippe, on the Werra, 50 miles southwest of Hanover. It consists of an old and a new town, the former poorly, the latter regularly built. Its principal edifice is the palace, a fine old castellated building, with a vast round donjon tower. In the vicinity, on the Grotenberg, the loftiest summit of the Teutoburger Wald, a colossal statue, 45 feet high, placed on a solid circular pedestal twice that height, has been erected to the Hermann or Arminius who overthrew Varus and his legions. Pop. 11,542.

Det'onating Powder, certain chemical compounds, which, on being exposed to heat or suddenly struck, explode with a loud report, owing to one or more of the constituent parts suddenly assuming the gaseous state. A mixture of equal volumes of chlorine and hydrogen exposed to direct sunlight detonates violently, forming hydrochloric acid gas. The chloride and iodide of nitrogen are very powerful detonating substances. The compounds of ammonia with silver and gold, fulminate of silver and of mercury, detonate by slight friction, by means of heat, electricity, or sulphuric acid. The compound used in the priming of percussion-caps and fuses is the fulminate of mercury or silver, collected as a precipitate when the metal, dissolved in nitric acid, is poured in warm alcohol and then collected, washed, and dried.

Det'onators are the devices used in firing high explosives by detonation. They consist of small cylindrical copper tubes closed at one end and charged with mercuric fulminate or a mixture of mercurial fulminate and potassium chlorate which is compressed in the bottom of the tubes. Those used for blasting in mines and quarries are also known as blasting caps and exploders. They are rated as single force, double force, triple force and so on, the charge for the single force cap being about five grains of the detonating substance and the charges for the higher force increasing about two grains for each grade. To fire them a piece of Brickford or "running" fuse of the desired length is inserted in the mouth of the detonator or cap and then the copper tube is bent or "crimped" securely about the sides of the fuse. The detonator is inserted in the bore hole so as to come in close contact with the first cartridge or "stick" of explosive and the bore hole is filled with tamping. When a flame is applied to the end of the fuse that projects from the bore hole, the column of powder in the fuse takes fire, the fire travels slowly down to the charge in the detonator, causing the detonation of the dynamite.

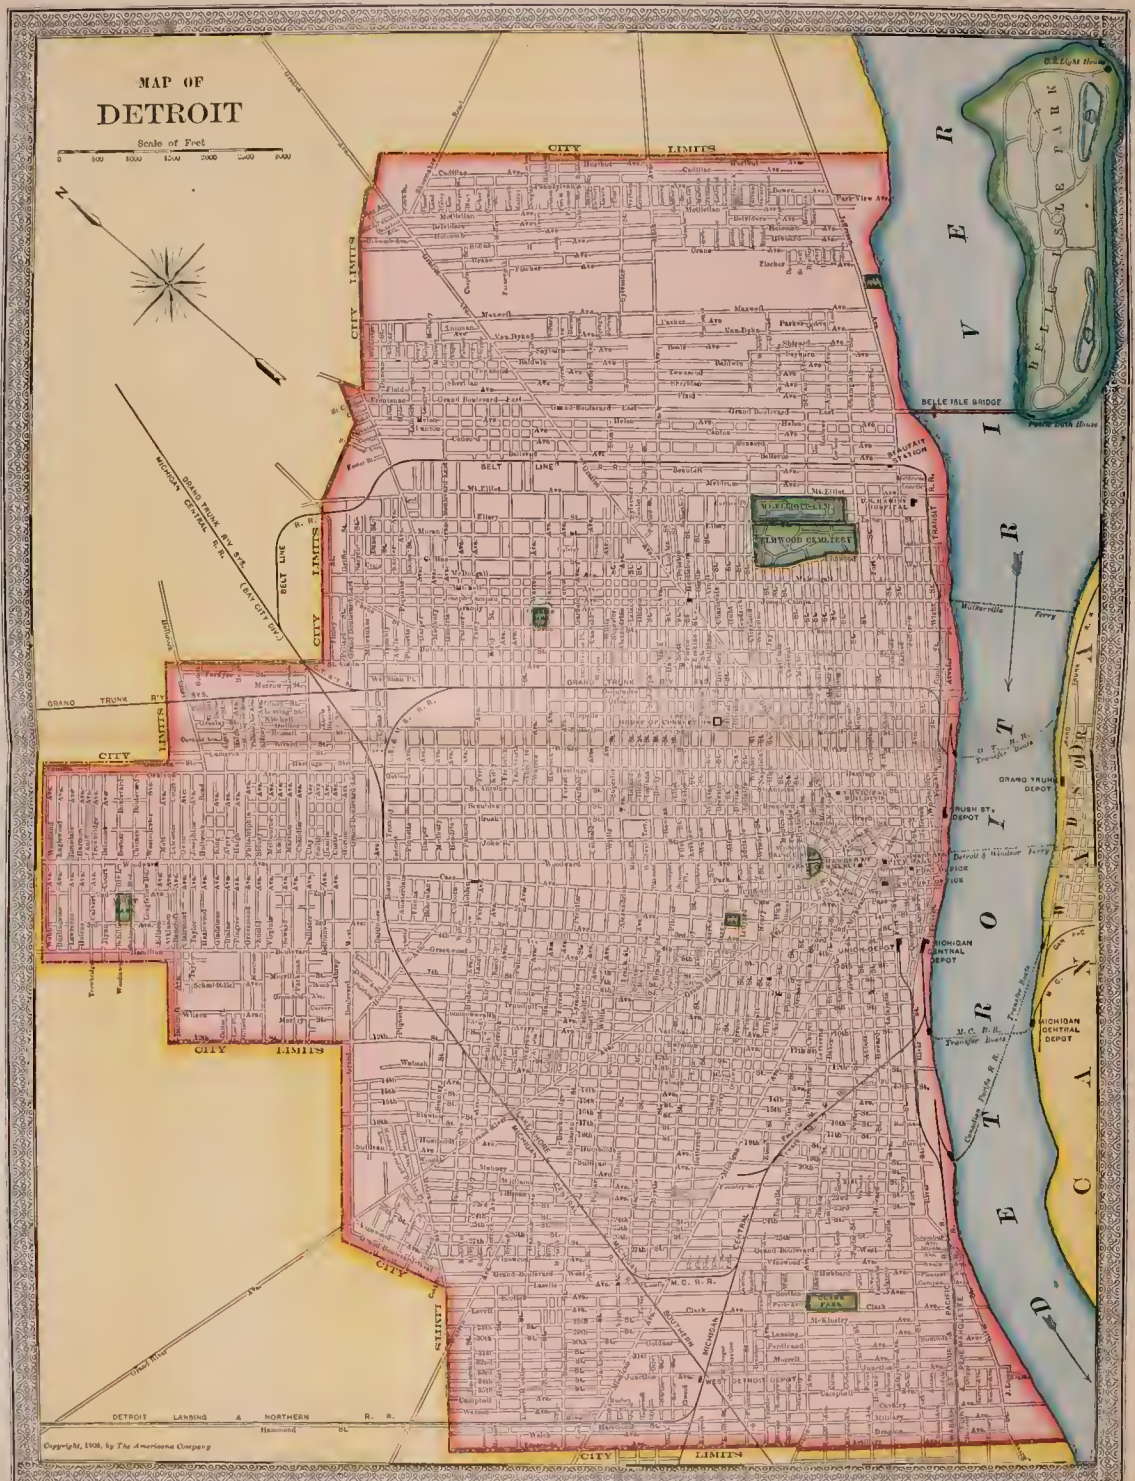
For military mines and naval torpedoes and, to a considerable extent, for commercial blasting, detonators to be fired by an electric current are employed. These are known as electric detonators. They differ from those previously described only in that the mouth of the copper cap is closed by a plug made of sulphur and ground glass, through which two copper wires, known as the "legs of the detonator," are led. Inside the cap these wires are bridged over by a very fine wire made of an alloy of iridium and platinum. Around the bridge and between it and the fulminating composition is placed a layer of mealed gun-cotton. When it is desired "to fire," the legs of the detonator are connected with a dynamo-electric machine and the current generated. As the current passes it heats the bridge to incandescence, which sets fire to the guncotton; this causes the fulminate to detonate, and this detonates the charge of dynamite or other high explosives. The electric detonators used in the United States navy contain 35 grains of mercuric fulminate, this large quantity being used to make sure that the detonator will do its share of the work in torpedo attacks on an enemy. See DETONATING POWDER; EXPLOSIVES.

Detri'tus, applied in geology to accumulations formed by the disintegration of rocks, may consist of angular and sub-angular debris, or of more or less water-worn materials, such as gravel, sand, or clay, or an admixture of these. Especially applicable to that fragmentary matter which if consolidated into a solid would form what is known as breccia.

De Trobriand, dē trō-brē-äṅ, **Philippe Regis,** BARON, American soldier: b. Tours, France, 4 June 1816; d. Bayport, Long Island, 15 July 1897. He was educated at the University of Orleans, studied law at Poitiers, and came to the United States in 1841. He was commissioned colonel of the 54th Volunteers in the Civil War 1861; and was appointed brevet brigadier-general in 1867. He was editor and publisher of the 'Revue du Nouveau-monde,' New York, 1849–50, and joint editor of the *Courier des Etats Unis* 1854–61. Among his works are: 'Les Gentilshommes de l'Ouest' (1841); 'Quatre ans de campagnes a l'Armee du Potomac' (1867).

Detroit (Fr. *détroit,* strait), Mich., capital of Wayne County, in the southeast; largest city of the State, and of the entire Northwest to the Pacific; 13th of the United States; on the northwest bank of the Detroit River dividing the United States from Canada, one end six miles below Lake St. Clair and the other about 14 from Lake Erie. It is 88 miles from Lansing, the State capital; 284 from Chicago; 60 from Toledo, Ohio; 251 from Buffalo; and 291 from Mackinaw. Pop. (1900) 285,704; (1903) about 325,000.

Detroit has the finest harbor on the Lakes; the river, on the city front, is often called "the Dardanelles of America." The broad outlet of Lake St. Clair, running west and dividing around Belle Isle, narrows to about half a mile and deepens to an average of 32 feet for some miles with a southwest course, before turning directly south, with a current of about two miles an hour. Fed by the Great Lakes, it has always a full stream, neither rising nor sinking much, and is little disturbed by storms; and the largest vessels can lie up to the wharves. Here is built Detroit, extending some seven miles along the river front, lined with wharves, elevators, foundries, warehouses, railroad stations, and freight depots, etc.; and about three miles deep, except in the centre, where it is nearly



d[illegible]. Area, 29¼ square miles, but with well-built suburbs outside not yet incorporated; indeed, from Grosse Pointe at the north where Lake St Clair ends to Gibraltar at the south where Lake Erie begins, the whole river front for 25 miles is built up with handsome villages, and lined with the summer villas of its wealthy business men, all really part of Detroit. At its southern corner, commanding the channel, is Fort Wayne, an unfinished military post once intended to be the most formidable fortification in the North-west, and still garrisoned and armed with batteries. Across the river in Canada are Windsor in the centre, the terminal of railroads through Canada, Walkerville on the north and Sandwich on the south.

The ground of Detroit is a gentle slope for 300 or 400 feet back from the river to 20 or 30 feet high; then sinks slightly, and again rises to about 50 feet, and 601 above the sea. The original plan, on a very small scale, was a series of concentric semicircles, or rather segments of polygons, with the Grand Circus — a semicircular park of five and a half acres — as a centre, nearly a mile from the river, toward which they extended. This feature is still preserved; but all the new growth has been laid out in checkerboard system, relieved by a series of noble avenues 100 to 200 feet wide radiating from the river. Jefferson Avenue extends along it; Woodward Avenue runs at right angles to it, dividing the city into halves and the Grand Circus into quadrants; south of Woodward are Michigan and Grand River avenues, at different angles and north is Gratiot. Between the Grand Circus and the river is the Campus Martius, an open space about 600x200 feet, crossed by Woodward and Michigan avenues, and from which start Monroe Avenue, and Fort Street running to Fort Wayne. The streets are generally wide. — 50 to 100 feet, — well shaded, and notably clean; some 300 miles of them are paved with brick and asphalt. The chief business street is Woodward Avenue. Jefferson Avenue is another leading one; Griswold Street, with the great banking houses, the custom-house, office buildings, etc., is the Wall Street of Detroit; and others about the Campus Martius are of importance. The chief of the show streets is the Grand Boulevard, a macadamized parkway 150 feet wide and 11 miles long, encircling the heart of the city in a vast sweep from Belle Isle bridge at the east to Fort Street near the western boundary. The outer portions of all the great avenues mentioned, of Lafayette Avenue, and of Fort Street, are full of fine residences; and a notable residence district clusters around Woodward Avenue as it stretches toward Palmer Park.

Public Buildings and Monuments.— The chief of these are on or near the Campus Martius. Within it, facing the city hall, is the Michigan Soldiers' and Sailors' Monument, by Randolph Rogers, of bronze and granite, 55 feet high, with a colossal bronze allegorical statue of Michigan on the summit; it cost $75,000. On the west, facing four streets, is the city hall, three stories and mansard, of sandstone in the Italian style; 200x90 feet, 86 feet high to top of cornice, 180 to top of tower; it cost $600,000, and is one of the finest in the West. Near by are the handsome Wayne County court-house, the largest public building in the city, and the splendid Majestic office building. On the north of the Campus is the Detroit Opera House. The custom-house occupies the old post-office, on Griswold Street, and the magnificent new post-office is on Fort Street, west of the City Hall. The Chamber of Commerce, the Athletic Club, and Y. M. C. A. buildings, the House of Correction, and the magnificent passenger stations, — the Michigan Central, and the new Union station at Fort and Third, — are all conspicuous. The churches will be mentioned later.

Public Service and Improvements, etc.— The city is exceedingly well sewered, and its death rate is very low, — 12.03 per 1,000 in 1901. The water supply is taken from a crib in Lake St Clair, 1,500 feet out, at a depth of 40 feet; the system has over 600 miles of pipes, and has cost above $6,000,000. It is supported partly by rates, and partly by a city tax. The electric lights are partly arc lights on high towers; there are about 1,800 in all. The electric railway system has over 200 miles of track within the city limits, and over 300 in suburban lines outside to every quarter; and ferries run to Windsor and Walkerville in Canada. There is a bridge over the American half to Belle Isle, but none over the full stream. There are three railway passenger stations, — the Union, the Michigan Central, and the Brush Street, all on the water front not far apart. The fire department has 27 steam fire engines, 6 chemical engines, 10 hook and ladder companies, 6 supply wagons, 2 fire boats, and a water-tower; besides reserve engines, etc. There are 434 fire-alarm boxes and 3,427 hydrants. The police system has seven precinct stations and six sub-stations, a signal office, and a harbormaster.

Parks, Pleasure Resorts, Public Amusements, etc.— Detroit has 21 public parks; besides a number of small triangular squares caused by the intersection of the radiating avenues with the streets, often with fountains. The largest, and the principal public resort, is Belle Isle in the river, whose entire 707 acres have been parked with great beauty at a cost of over $1,500,000, including a ring of little lakes and canals. It is reached by a handsome iron bridge built in 1889, at a cost of $315,000; and is to be increased 100 acres by taking in the southwestern shoals. The next largest is Palmer Park, of 141 acres, on Woodward Avenue, about 6½ miles from the river, sedulously made a colonial museum; it has a colonial log house, and a most interesting collection of colonial and other historical relics, besides a colonial casino. Clark Park in the west has about 25 acres; Voigt Park 8½; and the Grand Circus, in each of whose quadrants made by Woodward Avenue there is a fountain, 5½ acres. Besides these, there are opportunities for delightful summer trips on the river and lakes; and the river is dotted with charming places where excursion steamers run, from Grosse Pointe, on Lake St. Clair, famed for its cherry orchards, to Grosse Isle where Lake Erie opens. There are nine theatres and opera houses in the city, the largest of which are the Detroit and Whitney's opera houses, and the Lyceum. The finest cemeteries are Elmwood (Protestant) and Mt. Elliott (Catholic) side by side on the northeast, about two miles from the centre, beautiful in keeping and monuments; and Woodmere, some four miles to the southwest on high ground, is another beautiful one. a new and beautiful cemetery just opened, situated seven miles out Woodward Avenue, and Mt. Olivet, another large (Catholic) cemetery about seven miles out at the northeast. There are a number of Lutheran and Jewish cemeteries.

Schools, Libraries, Newspapers, etc.— In 1902 the public school system had 72 buildings, 66 brick and 6 wood, besides a central office building; and 3 high schools. There are, in addition to the above, 56 private schools in the city. Total number of teachers employed, 1,288; total number of children of school age, 83,215; total number of children attending school, 51,554; and the expenditures were $1,286,708. There is no Protestant nor non-sectarian institution for general higher education, the University of Michigan at Ann Arbor being only 37 miles away; but the Jesuits have Detroit College, opened 1877. There are also several special professional colleges: three medical, including the Detroit College of Medicine, with schools of pharmacy and dentistry, and Michigan College of Medicine and Surgery, Detroit Homeopathic College, and the Detroit College of Law. There are 82 periodicals, including 7 dailies, 2 of which are German. The one great library is the Detroit Public Library, opened 1865, containing nearly 200,000 volumes, and with branches in each high school as well as several outside. But Andrew Carnegie has offered to give $750,000 for a library, if the city will expend $75,000 a year in its support; the offer has not been accepted. The Hurlbut Library at the waterworks is also utilized as a distributing station. The Bar Association has a law library; and the Masonic lodges, the Trades Union Council, and the Museum of Art have also libraries. The latter institution, in part supported by a city tax, has a good collection of historical and archæological, art, and scientific relics and examples, valued at $300,000. These include the Stearn's Oriental collection, one of the finest in the country, and the Scripps gallery of old masters.

Churches and Charities.— In 1902 there were 200 religious societies in Detroit. The chief denominations were Roman Catholic (36 churches including the cathedral, it being the seat of a bishop), Methodist Episcopal (29), Lutheran (26 of different synods), Baptist (18), Presbyterian (15), German Evangelical (11), Congregational (10). There were also five Jewish synagogues and a temple; and several Catholic convents. Of the church buildings, the largest is the cathedral. Architecturally may be noted Ste. Anne's, and the Convent of the Sacred Heart, on Jefferson Avenue (both Catholic); the First and Fort Street Presbyterian; the Central Methodist; Trinity, St. John's, and Christ (Episcopal); Woodward Avenue Baptist; Church of Our Father (Universalist); First Unitarian; and the Temple Beth El.

The charities include a city poor fund, managed by a commission; and the Detroit Associated Charities. There are four large general hospitals, of which the most noted are Grace and Harper, with training schools for nurses; St. Mary's (Catholic) and the United States Marine Hospital. Besides these are some two dozen allied institutions,— lying-in hospitals, homes for Magdalens, foundlings, and orphans, the aged, etc. The House of Correction, whose buildings, grounds, and appliances have cost some $600,000, is of world-wide note.

Commerce and Industries.— Detroit is a highway through which passes all the commerce between the upper and lower lakes, to the volume of probably 50,000,000 tons yearly, or more than double that of the Suez Canal. It is the terminus of a great number of lake steamer lines, freight and passenger, and a chief calling point for others; and one of the greatest distributing points both by boat and rail between the United States and Canada, with which it does three fourths of its "foreign" trade. In 1902 its exports were $18,053,055, greatest of all the ports opposite Canada; and its imports $3,469,077. Of the really foreign trade, extra-continental, the greater part is to England. The exports are grain and flour, swine and their products, cattle, beef, and hides, sheep and wool, and lumber; though the latter trade has greatly declined of late years, as the Michigan pine forests have been stripped. Besides this, it receives and uses or ships east vast quantities of the produce of Michigan, of which it is the natural emporium; wheat, corn, and barley, hops, apples, dairy products, etc., besides those above mentioned. Its annual clearances of vessels are about 3,300, with a gross tonnage of over 500,000. It has the largest dry-dock on the lakes. Besides the water lines, it is the centre of seven great railroad lines, most of them among the chief trunk lines of the West and Canada; the Lake Shore, Michigan Central, Grand Trunk, Canadian Pacific, Père Marquette, Wabash, and Detroit Southern.

The manufactures of Detroit in 1900 turned out $100,892,838 in finished product, employing $71,751,193 of capital and over 51,000 workmen and officials, and paying nearly $24,000,000 in wages and salaries. The increase from 1890 was 63 per cent in number of establishments, and 30 per cent in value of product: a healthy sign, indicating greater diversity of industries and development of medium businesses. There is a large employment of skilled labor, as in optical goods ($225,000), professional and scientific instruments, etc. The greatest single item was in foundry and machine-shop products, $8,943,311; but if we add the allied industry of making the iron and steel itself — over $3,000,000, — the steamfittings and heating apparatus, and the architectural ironwork, the general iron and steel manufacture will come up to nearly $15,000,000. Next to this is the manufacture of tobacco products, amounting to over $6,500,000. Manufacturing chemicals and druggists' products is the third immense specialty, $4,915,913, the creation of the past 20 years almost wholly. Malt liquors come next. Furniture and carriages, using more skilled work to less stock, have largely supplanted the coarse lumber and planing-mill work once a chief industry. Brass castings are a heavy item; slaughtering and meat packing is important; and paints and varnishes occupy a prominent position.

Government, Finance and Judiciary.— The city is divided into 17 wards. The city council has but one chamber, and the council and the mayor are elected for two years. Most of the officials and commissions are elected; some are appointed by the council on the mayor's nomination; and the board of health is appointed by the governor of the State. The finances are regulated by a board of estimates. The city is the seat of the United States circuit court

for the sixth circuit, the district court for the eastern district of Michigan, the Wayne County circuit court, and local courts. The principal officials of the Lake Survey and the department in charge of the lake lighthouses have their offices here. The city's limit of borrowing is 2 per cent of its assessed valuation; which was about $250,000,000 in 1902. The tax rate was 2.13, and the amount raised $5,822,810.44. The net debt was $3,503,908.74. The banks of the city on 15 July 1901 consisted of 8 national, 14 savings banks, 2 trust companies, and 2 private banks. The joint-stock banks reported $70,553,247 resources, $7,850,000 capital, $2,070,000 surplus, and $80,221,322 deposits.

Population.— Detroit's figures since the first census taken 1820, are as follows: 1820, 1,422; 1830, 2,222; 1840, 9,102; 1850, 21,019; 1860, 45,619; 1870, 79,577; 1880, 116,340; 1890, 205,876; 1900, 285,704. Of these, 180,201 were native born; 99,503 foreign; 4,111 were colored. The total of foreign and those with foreign-born parents was 184,892; and the native white population of native parentage was but 61,300. But as about 32,000 of the foreign-born were English of England or Canada, and others from Scotland, Ireland, etc., the English element is about 100,000.

History.— The white man first visited Detroit, so far as records show, about 1655, and the first map of the region was published in 1656. The first settlement was made 24 July 1701, by Antoine de la Mothe Cadillac (q.v.), who had been governor of Michillimackinac, and wished to establish a permanent post for the centre of French power and commerce in the Northwest. He built Fort Pontchartrain, and settled it with 50 soldiers and 50 colonists. At the close of the French and Indian war, on 29 Nov. 1760, Maj. Robert Rogers took the place from the French commandant, Capt. Belestre, by order from the Marquis of Vaudreuil; the garrison were sent off as prisoners, but the Canadian inhabitants were allowed to retain their farms by swearing allegiance to the British crown. The first act of Pontiac's conspiracy in 1763 was to attempt seizing Detroit; but he was foiled, and after a desperate siege from 9 May to 12 October, heroically sustained by Maj. Gladwyn, the post was relieved, alone of all the western forts. In 1778 there were about 300 inhabitants, living mostly in log cabins, with a Roman Catholic Church; in that year the British built Fort Lernault, renamed Fort Shelby by the Americans on obtaining it, which was not till 1796. As part of the Northwest Territory, it came under the Ordinance of 1787, and in 1802 was incorporated as a town, but in 1805 was obliterated by fire except two buildings. It was rebuilt, and became the capital of Michigan Territory. In the War of 1812, William Hull surrendered it to the British under Isaac Brock on threat of a general massacre of the inhabitants by Brock's Indians. Hull was court-martialed for this act. The British, however, evacuated it the next year, and the Americans reoccupied it 29 September. It was incorporated as a village in 1815 and as a city in 1824. It remained the capital of the Territory till 1837, when Michigan became a State; then of the new State till 1847. Detroit celebrated its centennial 24 July 1901. Consult: Farmer, 'History of Detroit and Michigan' (1889), and 'Detroit' in 'Historic Towns of the Western States' (1901); Burton, 'Cadillac's Village' (1896); Parkman, 'Conspiracy of Pontiac' (1867); 'Landmarks of Detroit,' Ross and Catlin (1898).

C. M. Burton.
Author and Historian.

Detroit, Minn., county-seat of Beaker County; on Detroit Lake, and the Northern Pacific Railroad; about 200 miles northwest of St. Paul. The town is the trade centre of a rich agricultural district, and a popular summer resort because of its situation in the beautiful lake region of Minnesota. Pop. (1900) 2,000.

Detroit River, a river or strait which connects Lake St. Clair and Lake Erie, and forms part of the boundary between the United States and Canada. *Detroit* is the French word for strait: and the name was given by the French, the first white men who settled here. Its course is nearly south, with slow current, and sufficient depth of water for the navigation of large vessels. It is 25 miles long and three fourths of a mile wide opposite the city of Detroit, where it forms an excellent harbor. The tonnage passing through this river exceeds in volume that passing through any other river in the world.

Dettingen, dĕt'tĭng-ĕn, Germany, the name of several places in Germany, but the only one particularly deserving of notice is a village of Bavaria, on the Main, nine miles northwest of Aschaffenburg. It is noted for the victory gained in 1743 by the English and Austrians under George II. of England over the French under Marshal Noailles, in the war of the Austrian succession.

Deucalion, dū-kā'lĭ-ŏn, in Greek mythology, father of Hellen, ancestor of the Hellenes or Greeks, was the son of Prometheus and was king of Phthia. The following is the myth with which his name is connected. Zeus, it is said, determining to destroy mankind by water, on account of their impiety, brought a flood upon the earth, by means of a violent rain; Deucalion saved himself and his wife Pyrrha by building a wooden vessel which floated safely to the top of Mount Parnassus. After the flood had subsided they consulted the oracle of Themis to know what they must do to repair the loss of mankind, and were directed to veil their faces and throw behind them the bones of their mother. Understanding their mother to signify the earth, and her bones the stones, they did as the oracle directed. The stones thrown by Deucalion became men and those thrown by Pyrrha became women.

Deus, Joao de Rogueira Ramos, zhō-owñ roo-jā'rā rā-mōsh dā dā-oosh, Portuguese lyric poet: b. Sao Bartolomeu de Messines, province of Algarve, 8 March 1830. He is regarded by his countrymen as introducer of a new era of Portuguese poetry. National spirit, originality, sensibility, and rhythmic melody characterize his poems. They are published in 'Field-flowers' (1870); 'A Branch of Blooms' (1870); etc.

Deus Ex Machina, dē-ŭs ĕks măk'ĭ-nạ ("a god out of the machine"), a Latin phrase used to designate some unknown supernatural cause introduced to explain phenomena that one is not able to account for by natural means; or applied to some extraordinary and unlooked-for agency introduced to solve a difficulty or the like. The phrase is taken from the practice

in the Greek and Roman theatres of introducing a god from above by means of some mechanical contrivance whenever it was necessary to cut some dramatic knot which could not be loosed by the human actors.

Deuteron'omy (Gr. *deuteronomion*, the duplicate law, or duplication of the law, from *deuteros*, "second," and *nomos*, "a law"), the last of the books of the Pentateuch, so called from its consisting in part of a restatement of the law as already given in Exodus, Leviticus, and Numbers. It contains also, in addition to special commands and admonitions not previously given, an account of the death of Moses. This book presents the third and latest phase of the development of the Mosaic legislation. Its great aim is to check the encroachments of idolatry, and to concentrate the national worship in the great sanctuary at Jerusalem, especially at the three annual festivals. It is instinct with the prophetic spirit, and lays stress on the great commandment to love and fear God with the whole heart as the sum of the law. It is supposed by many critics that the book of the law found by Hilkiah, the high priest, in the house of the Lord during Josiah's reign (II. Kings xxii. 8–13) consisted of the larger portion of Deuteronomy. It may be divided into (1) four parting addresses of Moses to the Israelites in the plains of Moab, ch. i.–xxx.; (2) the charge to Joshua and to the priests, with the committal of the book of the law to the keeping of the latter, and his song, xxxi.–xxxii. 47; and (3) three appendices, namely, (*a*) announcement to Moses of his approaching death, xxxii. 48–52, (*b*) the poem conveying his blessing on the tribes of Israel, ch. xxxiii., and (*c*) an account of his death, ch. xxxiv. The authorship of this book has been traditionally assigned to Moses, with the exception of the few concluding verses which narrate his death, and which by many of the conservative school of theologians have been ascribed to Ezra. Of late years much critical labor has been bestowed on this and the four preceding books, constituting the Pentateuch, and the Mosaic authorship of the whole has been both assailed and defended with considerable learning and ability. See PENTATEUCH.

Deutoplasm. See EMBRYOLOGY.

Deutsch, doich, Emanuel Oscar Menahem, German Orientalist: b. Neisse, Silesia, 28 Oct. 1829; d. Alexandria, Egypt, 12 May 1873. His education was obtained at the University of Berlin and in 1855 he went to England to fill an appointment in the library of the British Museum, where for 15 years he studied and wrote. He is best known by his brilliant article on the 'Talmud' in the 'Quarterly Review' (1867), to which he also contributed an article on 'Islam' (1869). He was a valued contributor to the first edition of Chambers' 'Encyclopædia,' for which he wrote nearly 200 articles. A volume of his 'Literary Remains,' with sketch of his life was published in 1874.

Deutsch, Gotthard, American Hebrew scholar: b. Kanitz, Austria, 31 Jan. 1859. He was graduated from the University of Virginia in 1881. He is professor of Hebrew at Union College, Cincinnati. Besides his scholarly works, 'Symbolik in Cultus'; 'Theory of Oral Tradition'; and 'Philosophy of Jewish History,' he has published 'Andere Zeiten,' a novel.

Deutz, doits, Prussia, town in the province of the Rhine, on the river Rhine, opposite the city of Cologne, with which it is now incorporated. It is connected with Cologne by a bridge of boats 1,400 feet long. It is strongly fortified, as part of the defenses of Cologne — forming, in fact, a tête-du-pont. Deutz is a very ancient place, and is said to owe its origin to a castle built on its site by Constantine the Great. Pop. 17,782.

Deutzia, doit'sĭ-a or dūt'sĭ-a (so named in honor of the Dutch botanist Deutz), a genus of plants of the natural order *Saxifragaceæ*, containing seven or eight species, all of which are interesting for the beauty of their flowers. Some of the species are cultivated in America as hothouse flowers, or ornamental shrubs. The nearest relatives growing wild in the United States are the syringas. The deutzias are small shrubs indigenous to China and Japan, and northern India. They are covered with stiff, stellate hairs, on which account one species (*D. scraba*) is used by joiners in Japan to polish wood. The flowers are arranged in thyrsi like the lilac.

Deux-ponts, dė-pôn, the French name for the German town of Zweibrücken, in Latin *Bipontium*, all which names signify two-bridges. There was formerly a county of this name, which took its name from this town, which is now in the Bavarian Palatinate. It was afterward erected into a duchy. By the Peace of Lunéville (1801) the duchy was ceded, with all the left bank of the Rhine, to France, and afterward composed a part of the department of the Donnersberg. It contained 70,000 inhabitants, on 760 square miles. By the peace of 30 May 1814 it was restored to Germany. See ZWEIBRÜCKEN.

Deva, dā'va (Lat. *deus, divus*), among the Aryans in general, an epithet of divine persons and things; hence often opposed to the *dev* of the Parsees. It is commonly applied to the goddess Durgā, the wife of Siva, of terrific form and irascible temper. Devakātmajā is the mother of Krishna, who is also named Devākī. Devatarū is the holy fig-tree, belonging to Sverga or paradise. Devatā denotes a deity; Devadatta, the younger brother of Buddha, who is called Devadattārraja (Deodatus senior). Devadeva is a name of Brahma; Devapati is Indra, the god of the sky; Devayajna is the Homa or burnt sacrifice; Devarishi a celestial saint. There are a great many classes or choirs of inferior devatās, who are ministers to the higher gods, such as the 12 Adityas or forces of the sun; the Maruts or winds, the celestial musicians; in short, endless motley hosts with variable attributes. See BRAHMA.

Devanâg'arî, dā-va-nä'ga-rē (lit. "town-script of the gods"), the character most widely understood by Hindu scholars, in which Sanskrit works are usually printed, unless when in Roman letters. See SANSKRIT, ALPHABET.

Devaprayaga, dā-vä-prä-yä'gä, or **Deoprayag,** India, a sacred city of the Hindus, in the district of Garhwal, Northwest Provinces, on a mountain side, 2,266 feet above the sea, in the fork of the Alaknanda and the Bhagirathi, which join to form the Ganges. Devaprayaga possesses a notable temple, and is a favorite place of pilgrimage.

Developing in Photography. See NEGATIVE, DEVELOPMENT AND TREATMENT OF.

Development, when joined with the word theory, has often been used as a synonym for the term evolution, to denote the slow and gradual process by which, according to natural laws, animals and plants have passed from lower and simpler forms to higher and more specialized organisms. When used alone the word is employed in biology to signify the successive and more rapid changes which plants and animals undergo in passing from the embryo to the adult stage of individual life. This restriction is here observed in treating of development in animal life illustrated by examples shown in the accompanying plate. The changes taking place in the egg, or in the fœtus within the body of the parent, are described under EMBRYOLOGY.

After leaving the egg stage, or having been separated from the body of its parent, the animal is either complete in its organization, like the parent, or it passes through successive larval stages before it reaches the perfect form of adult life. A remarkable fact about the larval stages is that the organs are adapted to the necessities of each change in the development, so that the young may live to perpetuate the species, even though the parents die. Familiar illustrations of these transformations are recognized in the youthful period of butterflies and bees. But there are lower grades of animal life, in which the metamorphoses of the young are no less striking.

Among the crinoids, of the branch *Echinodermata*, which includes the starfish, is a genus lily-like in appearance which, as soon as the embryo is hatched from the egg, consists of little more than a mouth surrounded by hair-like processes called cilia. These delicate organs resemble eyelashes and are the forerunners of legs, fins, and wings in animals of more advanced types. In the young crinoid they are used for swimming and for drawing food into the mouth. Within a few days after it is set free in the water, this larva develops a calcareous stem surmounted with a cup or calyx and attaches itself to some object on the sea bottom. Soon afterward the calyx opens and expands like the sepals of a flower; long, arm-like tentacles grow out; the stem breaks off, and the adult crinoid becomes again a free swimmer. (See Plate 6, 6a.)

Higher in the scale of animal life, in the class *Crustacea*, are the *Cirripeds* (curly-hair footed) or barnacles. The adult is covered with a head-like shell, within which are contained the organs — the digestive apparatus, the double eye, and the numerous feet. Some barnacles by a fleshy peduncle attach themselves to a rock or to the bottom of a ship; others are attached by their sucking antennæ. In this sessile or stalked condition the barnacle opens its shell, and by the vibration of its feet captures its food, or again closes its shell to avoid danger. But after the hatching of the embryo, the larva, floating in the water, has but three pairs of feet, a pair of horns, a single eye, and a shield covering the back. This is known as the *nauplius* stage. After several moults, each accompanied by a change of structure, it enters the *Cypris* stage. The bivalve shell replaces the larval shield, and seven pairs of appendages are added. This free swimming stage is of short duration, and the animal fastens itself to some fixed object or to a sailing vessel. (3, 3a.)

The inhabitants of the water, like those of the land, are often infested with parasites. Of these the crustaceans furnish a large number. These enter as unwelcome guests the bodies of starfishes, ascidians (4b), and of many other sea animals. They inhere in the skin of fishes and cetaceans, or like the cirriped, the peltogaster, attack the unprotected part of the hermit crab. The larvæ of these pests quit the egg in the partly developed stage of *nauplius*, and through numerous moultings reach the adult form. The female often surpasses the male in the number of these changes, and is the larger of the two. (5, 5a.) Passing to the Crustacean Decapoda — the shrimps, lobsters, crayfish, and hermit crabs — the embryo stage of development is much more advanced than that of any other of the groups already mentioned. These long-tailed crabs are characterized by 20 segments of the body, and 19 pairs of appendages. The embryo-shrimps break the egg in a more complete form known as *zoea* — a stage which includes the carapax and the first four pairs of appendages. A second stage produces the five pairs of locomotive feet attached to the thorax, and the six pairs of egg-supporting feet joined to the abdomen. (2, 2a, 2b.)

Among the lowest forms of *Vertebrata* are the class *Elasmobranchii*, including sharks and skates. Interest in these animals is directed to the difference between their appearance and their structure. They look like fishes, but they are not strictly such. Their skeletons are not bony, but are cartilaginous. While the form of the adult points forward to the teleosts, or true fishes, the young shark, as the dogfish, and the young skate, as the torpedo, both in their form and structure point back to the higher invertebrates, the shrimps and crayfish. In form and in swimming organs these larvæ are similar and suggest the lower kinship. Yet the one develops into the elongated body of the dogfish with ordinary-fish like pectoral fins (8, 8a), and the other changes into the broad, flattened shape of the torpedo, with exaggerated pectoral fins scarcely distinguishable from the body (7, 7a).

In the sub-class *Teleostei*, or perfect-bone fishes, the group of *Heterosomata*, or flatfishes, including the English turbot and plaice, and the American halibut and flounder, present striking changes in development. At the stage of birth, and for some time afterward, the young show the bilateral symmetry common to other teleost tribes, swimming with their broad side vertical, an eye on each side. Gradually there is a tendency to lean to one side, which increases; the skull twists the other way, the under eye goes with the head, until a complete readjustment has been effected, and the fish swims with its flat surface parallel with the sea bottom and with its two eyes looking upward. (1, 1a, 1b.)

Development Hypothesis, in biology, the hypothesis or theory that species were not each of them a separate creation, but by some process or other came from previous species, the only exception, if any, in existence, being one or more primordial forms. By a similar process arose also the greater differences of structure, according to this theory, which distinguish genera, families, orders, classes, and even higher

1, 1a, 1b. Various stages of the Turbot. 2, 2a, 2b. Development of the Shrimp. 3. Free-Swimming form, and 3a. Sessile form of Barnacle. 4, 4a. Forms of a Nautopterus. 4. groups. Man comes into the world as an infant, and bodily and mental development, operating by means of changes so gradual as to escape notice at the time, make that infant successively pass through childhood, youth, and so on to full maturity. Growth, still continuing, is now less apparent than before, and finally counter causes arrest and overcome it and induce decline.

Similarly, plants grow from seeds; the oak being ultimately produced by the acorn. Thus development is the law of the individual, both in the animal and in the vegetable kingdom. Among the several races of mankind there is a tendency toward progress from a less to a more civilized state, which again is development in another form. If it is manifested in the individual and in the human, if not even in all species, the inquiry, according to the upholders of this theory, is inevitable. May it not also operate in the various genera, families, orders, etc.? May not the more highly organized animals and plants have in some way been developed from the lower ones, and the time-honored view that species — each of them a separate creation — are so nearly constant that they can run only into varieties, require modification?

Buffon, in a vacillating way, believed in the transformation of species. Lamarck strongly contended for the same view, first publishing his opinions on the subject in 1801; stating them at greater length in 1809 in his 'Philosophie Zoölogique,' and in 1815, in the introduction to his 'Hist. Nat. des Animaux sans Vertèbres.' He maintained that all species, man himself not excluded, had descended from other species existing at a prior time. As early as 1795 Geoffroy Saint-Hilaire suspected that all known species are degenerations of one primitive type; he did not, however, publish his views till 1828. In 1844 appeared a work called 'Vestiges of the Natural History of Creation,' which by 1853 was in its 10th edition, and strongly advocated the development hypothesis. Many replies to this work were given, the most celebrated being Hugh Miller's 'Footprints of the Creator; or, the Asterolepis of Stromness.' The eminent metaphysician, Herbert Spencer, in an essay which appeared in the 'Leader' in March, 1852, and republished in his 'Essays' in 1858, contrasted the theories of special creation and development, and intimated his belief in the latter.

The last-named year began a new epoch in the history of the development hypothesis; 1 July 1858, a paper was read by Dr. Alfred Wallace, and another by Charles Darwin, on 'Natural Selection,' a modification of the development hypothesis, to which each had come independently; the former on observation and reflection while studying the natural history of the Malay Archipelago, the latter by a powerful and long-continued consideration of the phenomena of organic life which he had witnessed during his voyage round the world in the Beagle surveying vessel from 1832 to 1836. This is the form in which the development hypothesis now flourishes. Darwin's celebrated book, 'The Origin of Species,' first appeared in 1859, and his 'Descent of Man' in 1871. Dr. Wallace's work on 'Natural Selection' came out in 1870. One of the earliest converts to the new doctrines was Prof. Huxley, who has done an immense deal to defend them and render them popular. In Germany the same views are earnestly advocated and carried out to an extreme length by Prof. Haeckel in his 'History of Creation,' published in 1873, and of which an English translation appeared in 1875. What was formerly termed development, and sometimes more vaguely the transmutation of species, is now often called evolution. See DARWINIAN THEORY.

Dev'ens, Charles, American jurist and general: b. Charlestown, Mass., 4 April 1820; d. Boston, Mass., 7 Jan. 1891. He was educated at Harvard, and was United States marshal for the district of Massachusetts at the time when the case of Thomas Sims, a fugitive slave, attracted widespread attention. Devens delivered Sims to his master in accordance with the law, and afterward tried to purchase his freedom, but did not succeed till after the outbreak of the Civil War. He served in the Union army from 1861 to 1865, retiring with the full rank of brigadier-general and the brevet rank of major-general. In 1873 he was made associate justice of the Massachusetts supreme court; in 1877 became attorney-general of the United States; and in 1881 resumed his place on the Supreme bench of his native State.

Deventer, dā'vĕn-tĕr, or **Demter,** Holland, an old town in the province of Overyssel, eight miles north from Zutphen, on the navigable river Yssel. It has a large town-hall, a court-house, and prison, places of worship for Calvinists, Lutherans, Mennonites, Roman Catholics, and Jews. The Groote Kerk has a fine Gothic tower and a crypt dating from the end of the 11th century. The followers of Gerard Groot, or "the Brethren of the Life in Common," have their college here. Deventer is famed for its "honey-cakes," a kind of gingerbread.

De Vere, dẹ vēr, **Sir Aubrey Hunt,** Irish poet: b. Curragh Chase, Ire., 28 Aug. 1788; d. there 5 July 1840. His works are: 'Julian the Apostate: a Dramatic Poem' (1822); 'The Duke of Mercia: an Historical Drama,' the volume containing also 'The Lamentations of Ireland' (1823); 'The Song of Faith, Devout Exercises, and Sonnets' (1842); and 'Mary Tudor: an Historical Drama,' published posthumously (1847). His sonnets Wordsworth declared to be "the most perfect of our age."

De Vere, Aubrey Thomas, Irish poet and essayist: b. Curragh Chase, Ireland, 10 Jan. 1814; d. there 21 Jan. 1902. He was a son of Sir Aubrey De Vere (q.v.), and became a Roman Catholic in 1851. In 1842 his first volume of verse appeared, 'The Waldenses,' and 'The Search after Proserpine' (1843). His subsequent books of verse include: 'Poems, Miscellaneous and Sacred' (1853); 'May Carols' (1857); 'The Sisters' (1861); 'The Infant Bridal' (1864); 'Irish Odes' (1869); 'The Legends of St. Patrick' (1872) 'Alexander the Great' (1874); 'Legends of the Saxon Saints' (1879); 'The Foray of Queen Meave, and other Legends of Ireland's Heroic Age' (1882); 'Legends and Records of the Church and the Empire' (1887); and 'St. Peter's Chains' (1888). Among his prose works are: 'English Misrule and Irish Misdeeds' (1848); 'Picturesque Sketches of Greece and Turkey' (1850); 'Ireland's Church Property and the Right Use of It' (1867); 'The Church Establishment of Ireland' (1867); 'Constitutional and Unconstitutional Political Ac-

tion' (1881); 'Essays, Chiefly on Poetry' (1887); 'Essays, Chiefly Literary and Ethical' (1889); 'Recollections of Aubrey de Vere' (1897).

De Vere, Maximilian Schele, American philologist; b. near Wexio, Sweden, 1 Nov. 1820; d. 1898. He came to the United States in 1843; and in 1844 became professor of modern languages and belles-lettres in the University of Virginia. His works include: 'Outlines of Comparative Philology' (1853); 'Stray Leaves from the Book of Nature' (1856); 'Studies in English'; 'Glimpses of Europe in 1848'; 'Romance of American History'; 'Wonders of the Deep'; etc.

Dev'eron, a river of Scotland, in Aberdeenshire and Banffshire, which flows into the sea at Banff. It is about 50 miles long. The salmon-fishery is very valuable.

Devi, dā'vē, in Hindu mythology, "the goddess," or Mahadevi "the great goddess," wife of the God Shiva and daughter of Himavit (that is, the Himalaya Mountains). She is represented as a being of two characters, one gentle, the other fierce, and it is under the latter aspect that she is generally worshipped. In the Mahabharata she appears under many forms, and her individuality is fully developed in the Puranas.

Devia'tion, in the law of marine insurance, an unnecessary departure from the course of the voyage insured. The legitimate reasons for departure from the course are stress of weather, want of repairs, joining convoy, succoring ships in distress, danger from an enemy, sickness, and mutiny. Even in these cases the quickest courses must be taken. Deviation, from the moment at which it commences, discharges the underwriter from all liability.

Deviation of the Compass, the deviation of a ship's compass from the true magnetic meridian, caused by the proximity of iron. In wooden ships no magnetic deviation is perceptible so long as the ship is heading north or south. The greatest deviation is seen when the vessel heads east or west. In iron ships the magnetism is fixed by hammering and riveting, and the deviation manifests itself exactly in accordance with the point toward which the hull headed while these processes were going on. Armor-plated ships should be plated with their head in a different direction from that in which they lay when built. The mode now generally employed to correct deviation is by introducing on board ship masses of iron and magnets to exactly neutralize the action of the ship's magnetism. Compasses are sometimes carried on masts as a means of removing them from the disturbing influence of the iron of the hull. In this position they serve as standards of comparison for the binnacle compass. Wooden ships are also magnetized, so as to affect the compass, though in a far less degree, by the direction in which they lie when building.

Devil (O. E. deofol; O. S. diubal; O. H. G. tiufal; M. G. Teufel; Gothic, diabolus, from Gk. διάβολος, a slanderer), an evil spirit, Satan, the tempter, slanderer, and tormentor of human beings, according to the Scriptures of the Old and New Testaments. Most of the old religions of the East acknowledged a host of demons not good or bad, but merely exercising a salutary or injurious influence. In the latter case they were looked upon as punishing spirits, without inimical or wicked purpose. Siva, the judging and destroying god of the Indian mythology, is a symbol of the great power of nature, which is alternately beneficent and injurious, but in itself neither good nor evil. Zoroaster named this evil principle *Ahriman.* The Greek mythology did not distinguish with the same precision between the good and bad spirits. Beelzebub, or Beelzebul, appears to have been regarded by the Jews as the prince of the devils. According to the Mohammedans, who have derived their account from Jewish traditions, the devil, or, as they sometimes call him, *Eblis,* was an archangel, whom God employed to destroy the *jinns* or genii, a race intermediate between men and angels, who tenanted the earth before the creation of Adam.

The Satan ("adversary") of the New Testament is a rebel against God. Endowed with the intellect and power of angels, he uses them since his fall to entangle men in sin, and obtain power over them.

The doctrine of Scripture on this subject soon became blended with numerous fictions of human imagination, with the various superstitions of different countries, and the mythology of the pagans. The gods of the ancients became evil spirits, seeking every opportunity to injure mankind. The excited imaginations of people frequently led them to suppose Satan visibly present; and innumerable stories were told of his appearance, and his attributes distinctly described. The writings of the fathers of the Church also contain several passages respecting the appearance of the devil. In many works or appearances of an extraordinary character, the devil was supposed to be concerned. Thus, many a dam, bridge, etc., has been built in one night with his assistance, and everyone knows that superstitious writers of former days, applying the legends that had become connected with Dr. Faust, the reputed worker of magic, to Fust, to whom the invention of printing has frequently been ascribed, taught that he invented the art by the help of Satan.

Devil-fish, huge rays of the family *Mantidæ,* which have a lozenge-shaped disk broader than long, with the head free from the pectoral fins and provided with a pair of anterior processes, and the tail long and whip-like. The two genera and six or seven species are confined to warm seas. So far as known, the young are produced alive after the eggs have hatched within the oviduct. The best known species are *M. birostris,* sometimes called the blanket-fish by tropical American pearl-fishers, from their belief that it attacks and devours men after enveloping them in its great wing-like pectoral fins, which reach a breadth of 20 feet. It is common in tropical American waters, and occurs on both the Atlantic and Pacific coasts of the United States. The name also applies to the *Octopus* and allied eight-armed *Cephalopoda* (qq.v.).

Devil-worship, the worship paid to the devil as a malignant deity, or the personified evil principle in nature, by many of the primitive tribes of Asia, Africa, and America, under the assumption that the powers of evil are as mighty as the powers of good, and have in consequence to be conciliated. There is a sect

called Devil-worshippers, or Yezidees, inhabiting Turkish and Russian Armenia and the valley of the Tigris, and numbering more than 200,000. They venerate the authority of the Old Testament above that of either the New Testament or the Koran. They practise both infant baptism and circumcision, and have a religious ministry of four orders. Their Christian ideas have reached them through Gnosticism. They pay respect to the devil, to Christ, and to Allah or the supreme being, and also worship the sun.

Devil's Advocate. See ADVOCATE.

Devil's Arrows, three Druidical stone obelisks set up, probably as landmarks, near Boroughbridge, Yorkshire, England.

Devil's Bible, The, the popular name of a manuscript Bible written on ass-skin. The name arose from a legend that the writing was the work of a man who by the Devil's help accomplished it in a few hours in order to save his life, but who in return became the slave of the Evil One.

Devil's-bit, the common name of a species of scabious (*Scabiosa succisa*), of the natural order *Dipsaccæ*. It has nearly globular heads of blue flowers, ovate leaves, and a fleshy root, which is, as it were, cut or bitten off abruptly. In America devil's-bit is one of the common names of *Lacinaria spicata*, which is known as dense button snakeroot, gay feather, backache-root, colic-root, etc. It belongs to the *Compositæ*, and is found in moist soil from Massachusetts to Florida and westward to Wisconsin and Louisiana.

Devil's Bridge, (1) an ancient bridge in Cardiganshire, Wales; it crosses the ravine through which flows the Mynach. (2) A bridge in Switzerland, crossing the Reuss, on the road over St. Gothard, from Germany to Italy.

Devil's Coach-horse (*Oxypus oleus*), a common British and European beetle, belonging to the family *Staphylinidæ*. It has very much reduced wing-covers, and like many of its relatives has the habit of curving its body upward, to adjust the wings under their covers.

Devil's Darning-needle. See DRAGON-FLY.

Devil's Dyke, (1) an earthwork in Cambridgeshire, England, of prehistoric construction, about 20 feet in height. It is supposed to have been erected as a defense against enemies advancing from the Fen country. It extended from the fens, or marshes, to the wooded hills, and thus closed the only way of approach from the interior towns of England, and prevented raids upon whatever band of conquerors held the country near the sea. (2) A natural formation near Brighton, England. The old legend said this was the work of the "good spirits" who thus prevented the devil's attempt to flood the country because the people had abandoned paganism.

Devil's-finger, a name sometimes applied to the starfish (q.v.).

Devil's Island (ISLE DU DIABLE), a small rock formation off the coast of French Guiana, belonging to France. The area is about 16 square miles, and the island itself is sandy, dry, and torrid. Here Alfred Dreyfus was imprisoned for alleged treason.

Devil's Parliament, a nickname for an English parliament which met in 1459 at Coventry. The parliament was under the control of Henry VI., and at his instigation proscribed and attainted for treason the Duke of York and his adherents.

Devil's Punch-bowl, a lake of Ireland, near the summit of Mangerton Mountain, in the vicinity of the Lakes of Killarney. It is between 2,000 and 3,000 feet above the level of the sea, and is supposed to be the crater of an ancient volcano. It is about half a mile in length and fully one third in breadth.

Devil's Slide, a gorge of the Utah Mountains, formed wholly by the natural arrangement of parallel crags and resembling an inclined plane. The accidental juxtaposition of two such boulder masses, accounted for by the simultaneous action of a cooling atmosphere on liquefied masses, is a feature of Utah scenery.

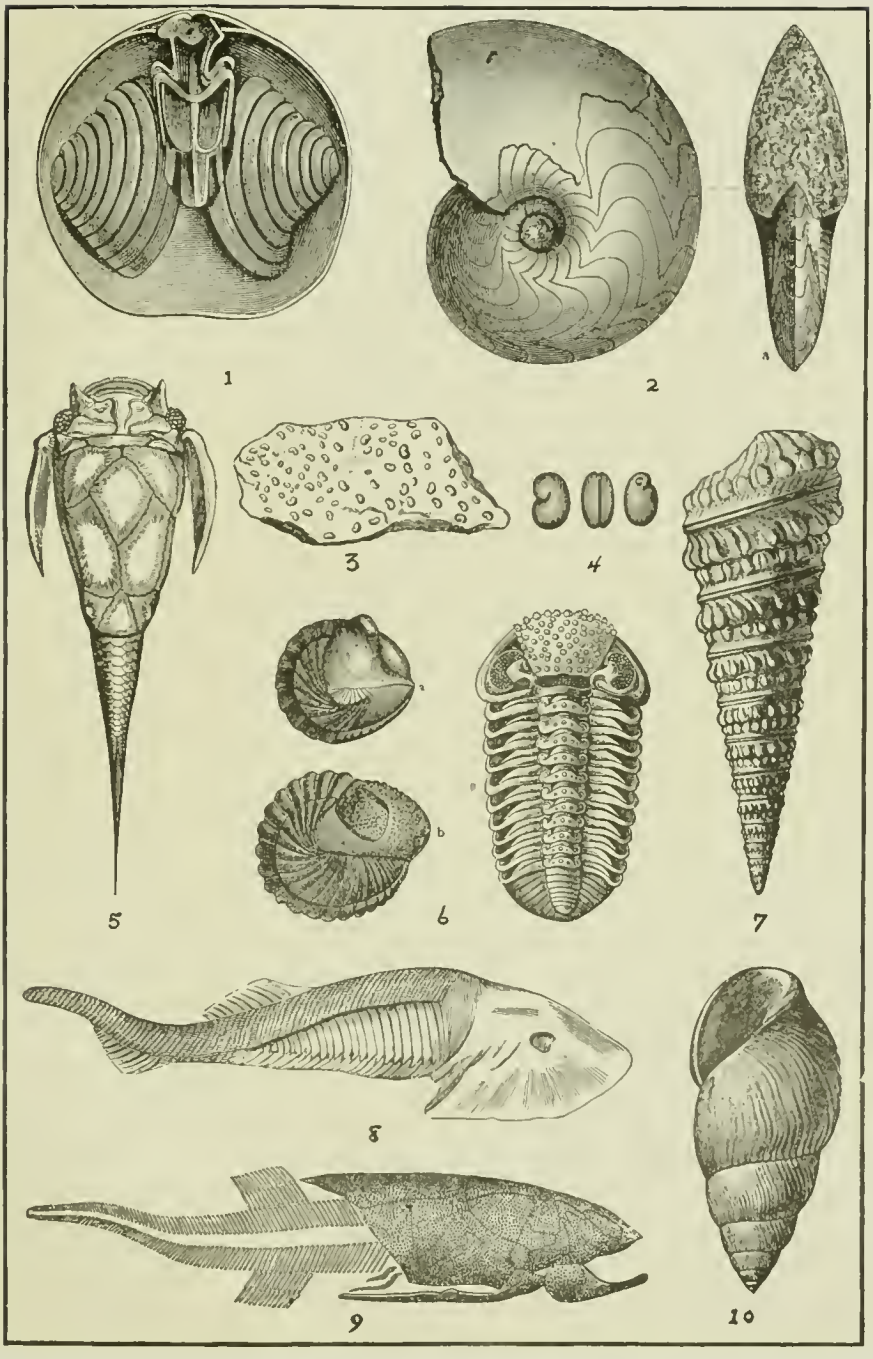
Devil's Wall, an ancient fortification in the southern part of Germany, about 368 miles long. This wall was originally a Roman ditch, with palisades behind it. It was intended to protect the Roman settlements on the left bank of the Danube, and on the right bank of the Rhine, against the inroads of the Teutonic and other tribes. Remains of it are found at present only from Abensberg, in Bavaria, to Cologne. As to the time when this rampart was built our information is very scanty. Some parts of the northern Roman fortifications may be as old as the time of Drusus. The Decumat or Tithe Lands, however; that is, the lands to the east of the Rhine and north of the Danube, which the Roman emperors allowed immigrants to settle on, on condition of paying tithes to the state, do not appear to have had any protecting wall about 14 B.C. The main rampart, stretching southward from the Main to the Danube, was probably completed under Hadrian, and parts of it which had been destroyed seem to have been restored by Probus. All the parts of this great rampart are still far from being thoroughly investigated.

De Vinne, Theodore Low, American printer: b. Stamford, Conn., 25 Dec. 1828. He learned the printer's trade and became an employee and later partner of Francis Hart, upon whose death he founded the firm of Theodore L. De Vinne and Company in New York. He has written several works on typography, including 'Invention of Printing,' and 'Historic Types.'

Devise, dē-vīz', a gift of real property by a person's last will and testament. The term devise technically and properly only applies to real estate; the object of the devise must therefore be that kind of property. The word, however, is sometimes improperly applied to a bequest or legacy. In regard to a lapsed devise, where the devisee dies during the life of the testator, although there may be a residuary devisee, the estate will go to the heir. But if the devise be void, as where the devisee is dead at the date of the will, or is made upon a condition precedent, which never happens, the estate will go to the residuary devisee, if the language is sufficiently comprehensive (4 Kent Com., 541, 542, and cases cited in notes). But some of the cases hold in that case, even, the estate goes to the heir (4 Ired. Eq., N. C., 320; 6 Conn., 292). In England a residuary bequest operates upon all the personal estate which the testator is possessed of at the time of his death, and will include such as would have gone to pay specific legacies which lapse or are void. A general de-

vise of lands will pass a reversion in fee, even though the testator had other lands which will satisfy the words of the devise, and although it be very improbable that he had such reversion in mind. A general devise will pass leases for years, if the testator have no other real estate upon which the will may operate; but if he have both lands in fee and lands for years, a devise of all his lands and tenements will commonly pass only the lands in fee simple. But if a contrary intention appear from the will, it will prevail. A devise in a will can never be regarded as the execution of a power, unless that intention is clear, as where otherwise the will would have nothing on which it could operate. But to have that operation the devise need not necessarily refer to the power in express terms. But where there is an interest on which it can operate, it shall be referred to that, unless some other intention is obvious. The devise of all one's lands will not generally carry the interest of a mortgagee in premises, unless that intent is apparent. Devises are contingent or vested — that is, after the death of the testator; contingent when the vesting of any estate in the devisee is made to depend upon some future event, in which case if the event never occur, or until it does occur, no estate vests under the devise. But when the future event is referred to merely to determine the time at which the devisee shall come into the use of the estate, this does not hinder the vesting of the estate at the death of the testator.

Devizes, dē-vī'zĕz, England, a municipal borough in the county of Wilts, 82 miles southwest of London. The chief manufactures are steam-engines, boilers, gas-engines, and beer. Pop. 6,914.



Dev'on, a river of Scotland, which has its source at the foot of the Ochill Hills, and flows into the Forth about two miles above Alloa. Its length is 34 miles. Below the Crook of Devon are a series of cascades, the most noted of which are the Caldron Linn and those at the Rumbling Bridge.

Devo'nian Period. In Devonian time, that part of Palæozoic time, following Silurian and preceding Carboniferous, North America was represented by a northern continental land mass and by an Appalachian land mass on the east, this Appalachian land having its western boundary where are the Blue Ridge Mountains, and extending as far south as Georgia; its eastern boundary, probably now covered by the Atlantic Ocean, may have been many miles from the present shore line. A continental land mass extended from the Hudson River westward, its shore line forming a great bay that covered central New York and part of Ontario, Ohio, and Michigan, and extending westward across Illinois, possibly connected with an uplift that reached from Wisconsin to South America. West of Wisconsin the Devonian land may have reached Montana. From northern Minnesota the continental shore line extended northwest to the Arctic Ocean in the neighborhood of the mouth of the Mackenzie River. The Gulf of St. Lawrence was much larger than now, and several long, narrow channels or sounds extended from it southwestward across New England and New Brunswick. There were islands along the line of the Cincinnati anticline in Ohio, Kentucky and Tennessee. There was a land area in eastern Colorado, another covering the area of the Black Hills in South Dakota, another in central Texas and there was a long narrow strip of land along the west side of what is now the great basin in Nevada and Utah.

In middle Devonian time Europe was largely covered by an open sea containing numerous islands, and most of Russia and Siberia and part of Central Asia were under water. In Scotland and Wales were landlocked seas or lakes, and there were others in western Russia. A large part of central South America was covered by water. Fossil evidence indicates that in early Devonian there were land connections between North and South America, and between South America and South Africa. The vegetable and animal life of Devonian time, so far as can be determined did not differ greatly from Silurian forms, though it shows a general advance toward more highly developed types. The land vegetation included cryptogams and Gymnosperms. Of the cryptogams the tree-ferns and the giant club-mosses (*Lepidodendra*) must have been conspicuous in the forests, being over 50 feet high. Of the gymnosperms, cycads, now almost extinct, were abundant, and it is possible that conifers of the yew family grew upon the higher ground.

Of animal life the trilobites, so abundant in Cambrian and Silurian time, were less important, but other crustaceans developed greatly, including the eurypterids, related to the horseshoe crabs, and decapods, or lobsters. Corals were very abundant in the Devonian oceans. Crinoids, or sea-lilies, and starfish were more abundant than in Silurian time. The brachiopods, or lamp-shells, apparently were, as in Silurian, the most abundant elements of marine life. Of mollusks, there were bivalves and gastropods; the ammonites appeared among the cephalopods, and nautilus-like forms were less abundant than in the Silurian. The chief characteristic of Devonian time, however, was the great development of the fishes, the Devonian being known as the "age of fishes." Many of the Devonian forms, however, have long been extinct, while the teleosts, which include by far the greater part of modern fishes, evidently did not exist at all in Devonian time. Among the odd Devonian forms were the ostracodermata, fish-like animals allied to the lampreys, but having the head and sometimes a large part of the body covered with bony plates. Of the true fishes the selachians, or sharks, were represented, as were the dipnoi or lung fishes, now almost extinct. The most highly developed Devonian fishes were the ganoids, now represented by the sturgeon and the gar-pike. See DEVONIAN SYSTEM; PALEOZOIC ERA.

Devonian System. The name Devonian appeared in geological literature in 1839, when Murchison and Sedgwick applied it to a rock system in Devonshire and Cornwall, England, consisting of conglomerates, shales and fossiliferous limestones lying below the carboniferous rocks and above the great mass of the graywacke or transitional series of Werner that was already included in the Cambrian or Silurian. Murchison and Sedgwick also included in the Devonian the old red sandstone of Scotland. In the United States, Hall of the New York Geological Survey, in an admirable report published in 1843, divided the Cambrian, Silurian,

1. A Brachiopod (Athyris concentrica), interior of dorsal valve, showing spiralia.
2. An Ammonite (Goniatites intumescens); a lateral view.
3. Hulls of fossil Entomostracans (Cypridida) in a slab of schist.
4. Shells of the same (Cypridina serratostriata).
5. An Armored Fish (Pterichthys cornuta).
6. A Trilobite (Phacops latifrons), shown in a and b rolled up.
7. A Gasteropod Mollusc (Murchisonia bigranulosa).
8. A Great Armored Fish (Cephalaspis lyelli); restored.
9. The Berry-bone Fish (Coccosteus decipiens); restored
10. A Gasteropod Mollusc (Macrocheilus subcostatus).

and Devonian systems of the Appalachian formations, and his work has needed little revision. The rocks of the Devonian System in North America are now subdivided into the Lower or Oriskany and Corniferous series, the Middle or Hamilton, and the Upper or Chemung. The Corniferous is subdivided into the Schoharie and Corniferous stages, the Hamilton into the Marcellus and Hamilton stages, and the Chemung into the Portage and Chemung stages. Where the line between the Silurian and Devonian systems should be drawn in North America is still a matter of dispute, the lower Helderberg formation of the Silurian being assigned to the Devonian by some European geologists. Of the stages named above, the Oriskany is a calcareous sandstone, covering eastern New York and extending south into Virginia, while on the west it extends into Ontario. It also outcrops in Illinois and in northern Alabama. It forms thick strata in Maine, and occurs in eastern Quebec. The Schoharie stage includes grits and fine conglomerates and having about the same distribution as the Oriskany. The Corniferous is a great limestone formation, largely made of corals, found in New York, Pennsylvania, Virginia, Ohio, Indiana, Illinois, Missouri and Iowa, also in Vermont and Quebec. The Hamilton series, which has about the same distribution as the Corniferous, is represented by a great thickness of shales and shaly standstones in New York and Ohio. It thins out southward and westward, and in Indiana, Illinois, Missouri and Iowa is represented by limestones. It is represented by sandstones and shales in eastern Quebec, and in New Brunswick and Nova Scotia. The Chemung series includes a thick shale and sandstone formation in New York, Ohio and Pennsylvania, but thins away rapidly to the westward. The flags, grits, shales, and sandstone of the Catskill group in New York are included for the most part in the Chemung. In Manitoba and the Northwest Territory, Canada, the Devonian System includes limestones and shales, and is of moderate thickness. There is an area of Devonian rocks extending along the Rocky Mountains from Montana across Alberta. In the United States the Devonian rocks of the Rocky Mountains appear in Colorado and Arizona. There are also ores in the Wasatch Mountains in Utah, in Nevada and in California.

In England and on the continent the Devonian System presents two different classes of rocks, (1) the Old Red Sandstone, occurring in Scotland, in South Wales and across the Welsh border in England, also in the Baltic provinces of Russia, and in Spitzbergen; and (2) the Marine Devonian, occurring in southwest England, in northern and southern France, in Spain, and over large areas in Germany and central Russia. The Old Red Sandstone was laid down in shallow seas either closed or having only slight connection with the open ocean. The formation is of interest from its containing remains of Devonian land animals and plants. The rocks are fine-grained conglomerates, sandstones, and shales. The Marine Devonian of Europe is largely limestone with some shales and slates.

Devonian rocks in Asia are found over a vast area in Siberia and also occur in China and in Asia Minor. In Africa they are found both in the northern and southern parts of the continent. In South America Devonian rocks form a great system, being found in Brazil, Bolivia, and the Falkland Islands. See CATSKILL GROUP; CHEMUNG STAGE; CORNIFEROUS STAGE; HAMILTON STAGE; MARCELLUS STAGE; PORTAGE STAGE; OLD RED SANDSTONE; ORISKANY STAGE.

See Zittel, 'History of Geology and Palæontology'; Dana, 'Manual of Geology'; Geikie, 'Text-book of Geology'; Leconte, 'Elements of Geology.'

Dev'onport (before 1824 called **Plymouth Dock**), England, a parliamentary and municipal borough, maritime town, and naval arsenal, in the southwest of Devonshire. It owes its existence to the dockyard established here by William III. in 1689, and is one of the chief naval arsenals in Great Britain.

Dev'ons, the name given to a breed of cattle which were first bred in Devonshire, England. They are rather wild, of a dark-red color, and can be used instead of horses for plowing. They are smaller than Shorthorns or Herefords. The bull has a small head, fine muzzle and face, very handsome horns, which should taper upward and rather backward; the eye is large and rather wild, indicating an active disposition; the neck is arched, but the dewlap is not much developed; tail set on rather high; good barrel well up behind the shoulder; not the depth of carcass in the same height as is found in the Shorthorns; skin of a dark-red and rather mottled character, and plenty of long curling hair; the skin is thicker than that of Shorthorns, but not so thick as that of Herefords. They form a good deal of inside fat and firm meat. The cows yield a very rich milk. They are hardy, and able to find food on poor uplands.

Dev'onshire, Spencer Compton Cavendish, 8TH DUKE OF, English statesman: b. 23 July 1833. He succeeded to the ducal title in 1891, having previously become well known by his courtesy title of the Marquis of Hartington. First returned to the House of Commons in 1857, he was appointed a lord of the admiralty in 1863, and secretary of state for war in 1866. He was postmaster-general under Gladstone 1868–71, and chief secretary for Ireland 1871–4. He was secretary for India 1880–82, and became secretary of state for war 1882–5. Since 1886 he has been recognized as an active and influential leader of the Liberal Unionists, and on the formation of a Unionist ministry in 1895 accepted the post as lord president of the council.

Devonshire, the third largest county in England, situated in the southwest. It is famous for its Old Red Sandstone (see DEVONIAN SYSTEM). This county contains the barren tract of Dartmoor and also the valley of the Exe, called "The Garden of Devonshire." For history, see ENGLAND.

Devrient, dĕv-rē-ănt, a family of German actors, of whom the most talented was LUDWIG DEVRIENT (1784–1832), distinguished both in comedy and in tragedy, and especially noteworthy as an exponent of Shakespearian characters. His nephew, CARL AUGUST (1797–1872), the eldest of the brothers Devrient, played lovers' parts and was the husband of the *diva*, Madame Schröder-Devrient (1805–60). PHILIPP EDUARD (1801–77), the second brother, was a delightful baritone singer in the early part of

the 19th century, and afterward became a painstaking, though not a great actor. He was the author of a number of plays, and of the valuable 'Geschichte der deutschen Schauspielkunst' (1848–74); and with his son Otto (1838–94) prepared an edition of Shakespeare. GUSTAV EMIL (1803–72), the youngest and most gifted of the three brothers, was most successful in tragic and emotional parts, and became identified in Germany with such characters as Hamlet, Tasso, and especially Posa.

De Vries, dē vrēs, **David Peterzen**, Dutch colonist in America. Nothing definite is known as to the dates of his birth and death. He was a member of a company organized in 1630 to settle the tract of land in the present State of Delaware, which had been bought in 1629 from the Dutch West India Company by Samuel Blommaert and Samuel Godyn. On his arrival 1632 he found that the colony founded 1631 on Lewes Creek, Cape Henlopen, and called with the surrounding country "Swaanendael," had been completely destroyed by the Indians. He left some of his party there and visited Virginia, but took the colonists back to Holland in 1634. Later he visited Manhattan several times and tried to found a colony on Staten Island, which the Indians destroyed in 1640. He also lived on a plantation called Vriessendael, on the site of Tappan, N. Y. Among his works is: 'Korte historiaal ende Journaels Aenteyckeninge van verscheyden Voyagien in der Vier Teelen des Wereldts Ronde'; 'A short history and notes of a journal kept during several voyages in the four parts of the world' (1655).

Dew, Thomas Roderic, American publicist: b. King and Queen County, Va., 5 Dec. 1802; d. Paris, France, 6 Aug. 1846. He was graduated from William and Mary College, and in 1827 was elected professor of political economy, history, and metaphysics in William and Mary College, and in 1836 was made president of that institution. In 1829 he published his 'Lectures on the Restrictive System.' It was brought out at a moment when feeling ran high on the subject of the tariff, between protectionists and free-traders; and though emanating from the closet of a thinker removed from the agitations of political warfare, took a strong hold on the public mind, and the subsequent adoption of the compromise of 1832 may be attributed in part to its silent influence. His most elaborate work was 'A Digest of the Laws, Customs, Manners, and Institutions of the Ancient and Modern Nations' (1853).

Dew, a deposition of water from the atmosphere upon the surface of the earth. During the day the earth both absorbs and emits heat, but after sunset its supply of warmth is cut off, while it still continues to radiate heat into the surrounding space. Grass, flowers, and foliage being good radiators, lose after sunset the heat which has previously been absorbed by them, without receiving any in return, and their temperature consequently falls considerably below that of the atmosphere. From the proximity of these cold substances the particles of vapor in the adjoining air are condensed and deposited upon their surfaces in the form of dew, or of hoarfrost where the temperature of the earth is below 32°. When the sky is clouded the heat abstracted from the earth's surface by radiation is restored by the clouds, which, being good radiators, transmit an equal amount of heat to what they receive; and a balance of temperature being thus maintained between the earth and the surrounding atmosphere, no dew is formed. The deposition of dew is likewise prevented by wind, which carries away the particles of air before the vapor contained in them has been condensed by the heat imparted by the adjoining radiating substances. Horizontal surfaces, and those which are exposed to a wide expanse of sky, receive a greater supply of dew than sheltered or oblique surfaces, where circumstances diminish the amount of radiation.

An acquaintance with the cause which produces dew and hoarfrost enables us to understand the rationale of the process resorted to by gardeners to protect tender plants from cold, which consists simply in spreading over them a thin mat or some flimsy substance. In this way the radiation of their heat to the heavens is prevented, or rather the heat which they emit is returned to them from the awning above, and they are preserved at a temperature considerably higher than that of the surrounding atmosphere. To insure the full advantage of this kind of protection from the chill of the air, the coverings should not touch the bodies they are intended to defend.

The radiation from the earth's surface is one of those happy provisions for the necessities of living beings with which nature everywhere abounds. The heavy dews which fall in tropical regions are in the highest degree beneficial to vegetation, which, but for this supply of moisture, would, in countries where scarcely any rain falls for months, be soon scorched and withered. But after the high temperature of the day the ground radiates under these clear skies with great rapidity, the surface is quickly cooled, and the watery vapor, which, from the great daily evaporation, exists in large quantities in the atmosphere, is deposited abundantly. This deposition is more plentiful also on plants, from their greater radiating power; while on hard, bare ground and stones, where it is less wanted, it is comparatively trifling. In cold climates the earth, being cold and sufficiently moist, requires little dew; accordingly the clouds, which are so common in damp and chilly regions, prevent the radiation of heat: the surface is thus preserved warm, and the deposition of dew is, in a great measure, prevented.

Dewas, dā-wās', India, (1) a native state in the Nimar and Malwa agency, consisting of two combined states with two chiefs; area 883 square miles. Grain, opium, sugarcane, and cotton are its chief productions. Pop. 152,073. (2) Dewas, the chief town, contains the residences of both chiefs, and near it, on a conical hill, is a temple. Pop. 15,100.

Dew'berry, *Rubus villosus*, or *Rubus canadensis*, a trailing plant of the natural order *Rosaceæ*. Its prickly stems, leaves, and fruit resemble the blackberry. During the last quarter of the 19th century it became popular as a cultivated fruit, principally through the introduction of its variety, the *Lucretia*, which is superior to the wild forms common as weeds on wornout pastures and poor land. The plants, which are propagated by means of stem-tips, do best on a rather lighter soil than the black-

berry, like which, with the exception of training, it is cultivated and fertilized. They are usually trained to stakes or trellises, and not given summer pruning, except in the removal of canes as soon as they have fruited. The usual distances for planting are three or four feet by six. The fruits ripen considerably in advance of the blackberries. See BLACKBERRY; RASPBERRY; RUBUS.

Dewdney, Edgar, Canadian statesman: b. Devonshire, England, 1835. He studied civil engineering, and on removing to Canada was employed to lay out the town of New Westminster. Though working at his profession for a number of years, he took an active interest in politics, was elected to the legislature of British Columbia in 1869, and in 1872 was elected to the Canadian Parliament, where he was one of the chief supporters of Sir John Macdonald of the Opposition. In 1871 he was appointed Indian Commissioner for the Northwest Territory, and in 1881 lieutenant-governor of the Territory, holding the two offices until 1888, when he became minister of the interior in the Canadian cabinet. In 1892 he was appointed lieutenant-governor of British Columbia.

Dewees', William Potts, American physician: b. Pottsgrove, Pa., 5 May 1768; d. Philadelphia 18 May 1841. He attended several courses of medical lectures at the University of Pennsylvania, and in 1793 began practice in Philadelphia. Here he achieved for himself a high reputation, especially in that department to which he devoted particular attention, midwifery, previously much neglected in America. He published 'Inaugural Essays'; 'System of Midwifery,' of which latter many editions have been printed'; 'A Treatise on the Physical and Medical Treatment of Children'; 'A Treatise on Diseases of Females'; 'Practice of Medicine' (1830). In 1826 he was elected adjunct professor, and in 1834 professor of obstetrics and diseases of women and children in the University of Pennsylvania.

De Wet, dā-vĕt', **Christiaan,** Boer general: b. Dewetsdorf, Orange Free State (now Orange River State), about 1860. He was bred a farmer, made a small fortune, and became a member of the Volksraad. Though practically without military experience, he served ably in the Boer-British War of 1899–1900, attaining the rank of general and outwitting the pursuit of Kitchener and Roberts in the summer of 1900, and of the former in the early part of 1901. His stand at Sanna's Post was highly praised by military experts. He was especially noted for his humane treatment of prisoners of war. His 'Three Years of War' was published in 1902.

De Wette, dĕ vĕt'tĕ, **Wilhelm Martin Leberecht,** German theologian: b. Ulla, near Weimar, January 1780; d. Basel, Switzerland, 16 June 1849. In 1807 he became professor of theology at Heidelberg, and in 1810 he was called to be the colleague of Schleiermacher at Berlin. In 1822 he accepted the chair of theology at Basel, where he remained till his death. The influence of De Wette's views upon the theological tendencies of his time was most important. He was remarkable for his critical acuteness, and for his powers of concise and clear exposition. His works are very numerous. Among them are: 'Beiträge zur Einleitung in das Alte Testament' (1806–7); 'Lehrbuch der historisch-kritischen Einleitung in die kanonischen und apokryphischen Bücher des Alten Testaments' (1817); 'Einleitung in das Neue Testament' (1826); 'Lehrbuch der hebräisch-jüdischen Archäologie' (1814); 'Kurzgefasstes exegetisches Handbuch zum Neuen Testament' (1836–48). These works are all more or less of a critical nature; in the following he developed his own theological views: 'Lehrbuch der christlichen Dogmatik' (1813–16); 'Christliche Sittenlehre' (1819); and the didactic novel, 'Theodor oder des Zweiflers Weihe' ('Theodore, or the Consecration of the Sceptic,' 1822).

Dewey, Chester, American educator: b. Sheffield, Mass., 25 Oct. 1784; d. Rochester, N. Y., 15 Dec. 1867. He was graduated at Williams College in 1806, where, in 1810, he became professor of mathematics and natural philosophy, a post he held 17 years. In 1836 he was appointed principal of the Collegiate Institute in Rochester, N. Y., and in 1850 became professor of chemistry and natural philosophy in the University of Rochester, resigning 10 years later. He was an authority on grasses. He wrote 'History of the Herbaceous Plants of Massachusetts,' and valuable papers on botany.

Dewey, Davis Richard, American political economist and statistician: b. Burlington, Vt., 7 April 1858. He is a brother of John Dewey (q.v.). He was educated at the University of Vermont, and at Johns Hopkins University. He is professor of economics and statistics in the Massachusetts Institute of Technology, and secretary of the American Statistical Association. His works are: 'Syllabus of Political History Since 1815'; 'Report of Massachusetts Board to Investigate the Subject of the Unemployed' (1895); 'Report of Commission to Investigate the Public Charitable and Reformatory Interests and Institutions of the Commonwealth' (1897); 'Financial History of the United States' (1902).

Dewey, George, American naval officer: b. Montpelier, Vt., 26 Dec. 1837. At 17, after a preparatory course in the Northfield Military School, young Dewey was appointed a cadet at Annapolis, in the class which was graduated in 1858. At the outbreak of the Civil War he was commissioned a lieutenant under Admiral Farragut and assigned to the sloop-of-war Mississippi. His first active experience in war was when the West Gulf squadron, early in 1862, forced a passage up the Mississippi River ahead of Farragut. A later enterprise resulted in the grounding of the Mississippi, in the middle of the night, while attempting to run the batteries of Port Hudson. Here she was riddled with shot and set afire by the enemy's batteries, so that officers and crew had to abandon her, and make their way as best they could to the other shore before the flames reached her magazine and she exploded.

Other notable engagements in which Dewey figured during the Civil War were at Donaldsonville in 1863, and at Fort Fisher in the winter of 1864–5, as an officer of the Agawam. Receiving his commission as lieutenant-commander in March 1865, he served for two years on the Kearsarge and the Colorado, and was then attached to the Naval Academy for two years more. In 1870 he was given command of the Narragansett, and during his five years' charge

of her rose to be a commander. He was then attached to the Lighthouse Board, and in 1882 took his next sea duty in command of the Juniata of the Asiatic squadron. On reaching his captaincy, in 1884, he took charge of the Dolphin, one of the first vessels of the new navy. From 1885 to 1888 he commanded the Pensacola, then flagship of the European squadron; and this service was followed by shore duty, in the course of which he served as chief of the Bureau of Equipment at the Navy Department, and afterward on the Lighthouse Board for a second time. In 1890 he was promoted to commodore, and made president of the Board of Inspection and Survey. At the beginning of 1898, a few weeks before the outbreak of the Spanish-American war, he was placed in command of the Asiatic squadron, and was thus given the chance to distinguish himself which he so brilliantly improved.

With his squadron he left Mirs Bay, China, 27 April 1898, with orders to "capture or destroy the Spanish squadron," then supposed to be in Manila Bay, under command of Admiral Montojo. The squadron entered the channel of Manila at 11:30 P.M., Saturday, 30 April, and early on Sunday morning, 1 May, sank, burned or captured all the ships of the Spanish squadron in the bay, silenced and destroyed three land batteries, obtained complete control of the bay, so that he could take the city, the chief port of the Philippine Islands, at any time, and all without losing a single man, and having only nine slightly wounded. On 18 August Dewey and his ships aided Gen. Merritt in the capture of Manila. In recognition of his Manila Bay achievement, Commodore Dewey received the thanks of Congress, which awarded to him a magnificent sword, and medals to his men. As a further recognition of his achievement, Commodore Dewey was (7 May 1898) promoted to be a rear-admiral, and subsequently (3 March 1899) made admiral of the navy under an act of Congress, approved 2 March 1899, restoring that rank for the especial purpose of enabling the country to honor adequately the hero of Manila Bay. In 1901 he was president of the Schley court of inquiry, and in 1902 was appointed commander-in-chief of the united squadrons and fleets mobilized for extraordinary manœuvres. Consult Clemen's 'Life of Dewey' (1899).

Dewey, John, American psychologist: b. Burlington, Vt., 20 Oct. 1859. He was educated at the University of Vermont and has been professor of philosophy at the University of Chicago from 1884, and editor of the 'Elementary School Record.' Among his works are: 'Psychology'; 'Leibnitz's New Essays Concerning Human Understanding'; 'Critical Theory o Ethics' (1891); 'Study of Ethics.'

Dewey, Melvil, American educator and librarian: b. Adams Centre, N. Y., 10 Dec. 1851. He was graduated from Amherst College in 1874; was college librarian during his senior year and for two years after graduation. He then went to Boston where he was active in founding the American Library Association, the Library Bureaus, the Metric Bureau for introducing the metric system, and the Spelling Reform Association. He was the founder and for five years the editor of the 'Library Journal' and also editor of 'Library Notes' and the 'Spelling Reform Bulletin.' In 1883 he was appointed librarian at Columbia, and in 1887 established the school of library economy, of which he was made director. In 1889 he became secretary of the University of the State of New York, and director of the State library, the library school being at that time transferred to Albany; in 1891 he became director of the home education department, and organized the system of traveling libraries. In New York State he has accomplished much in the raising of school standards, and particularly in the improvement and founding of small public libraries. He has also had much influence on library work in the United States; has twice been president of the American Library Association, and its secretary for 15 years; he devised the decimal system for the classification of books which is widely used, and published a set of cataloguing rules, included in his 'Library School Rules.' He has also published a revision of the laws of New York State in regard to education (1892), and the 'Decimal Classification and Relative Index' (1885).

Dewey, Orville, D.D., American Unitarian clergyman: b. Sheffield, Mass., 28 March 1794; d. there 21 March 1882. He was graduated at Williams College in 1814, and pursued his divinity studies at Andover Theological Seminary 1816–19; but became a Unitarian and soon after an assistant of Dr. Channing. He was pastor of the Unitarian Church in New Bedford 1823–33, and of the 2nd Unitarian Church in New York 1835–48. He published: 'The Old World and the New' (1836); 'Letters on Revivals'; 'Discourses on Human Nature'; 'Discourses on Human Life'; 'Discourses on the Nature of Religion'; 'Discourses on Commerce and Business'; 'Miscellaneous and Occasional Discourses'; 'The Unitarian Belief'; 'Discourses and Reviews.'

De Windt, de wint, **Harry,** English explorer: b. Paris, France, April 1856. He was educated at Cambridge, and after serving as aide-de-camp to his brother-in-law, Rajah Brooke of Sarawak, 1876–8; went from Peking to Paris by land 1887; visited mines and prisons in Siberia 1890–4; explored the Klondike 1897, and went from Paris to New York by land for the London *Daily Express* 1901–2. He has written: 'On the Equator' (1882); 'From Pekin to Calais by Land' (1887); 'A Ride to India' (1890); 'Ennui de Voyage,' poems (1890); 'Siberia as it Is' (1892); 'The New Siberia' (1895); 'A Queer Honeymoon,' a novel; 'Through the Gold Fields of Alaska to Bering Strait' (1898); 'True Tales of Travel and Adventure' (1899); 'Finland as it Is' (1901).

Dewing, Thomas Wilmer, American figure and portrait painter: b. Boston 4 May 1851. He was a pupil of Boulanger and Lefèbvre and is an academician of the National Academy of Design 1888, and a member of the Society of American Artists. Among his pictures are: 'Prelude'; 'The Days,' which took the Clarke prize in 1887, and 'The Garden.'

De Wint, Peter, English landscape painter in water-colors: b. Stone, in Staffordshire 21 Jan. 1784; d. London 30 June 1849. He studied in the schools of the Royal Academy, where he occasionally exhibited; but most of his pictures were shown in the exhibitions of the Water-color Society. English scenery was his

ADMIRAL GEORGE DEWEY.

favorite subject. He occasionally painted in oil with marked success. Some of his best pictures are: 'A Corn-field'; 'Woody Landscape with Water'; 'Lincoln Cathedral'; and 'Harvest-time.'

De Witt, Jan, yän dĕ vĭt, Dutch statesman: b. Dort 1625 or 1632; d. The Hague 20 Aug. 1672. He became the leader of the political party opposed to the Prince of Orange, and in 1652, two years after the death of William II., was made grand pensionary. In 1665 the war with England was renewed and conducted by De Witt with great ability till its termination in 1665. In 1672 Louis XIV. invaded the Spanish Netherlands and involved Holland in war. De Witt's popularity, already on the decline, suffered still further in the troubles thus occasioned, and he felt it necessary to resign his office of grand pensionary. At this time his brother Cornelius, who had been tried and put to torture for conspiring against the life of the young Prince of Orange, lay in prison. Jan de Witt went to visit him, when a tumult suddenly arose among the people, and both brothers were murdered. De Witt was a man of high character, simple and modest in all his relations.

Dewitt, John, American Dutch Reformed clergyman: b. Albany, N. Y., 29 Nov. 1821. He was graduated at Rutgers College in 1838, and at New Brunswick, N. J., Theological Seminary in 1842. He was pastor of several churches 1842–63, and professor of Oriental literature and of Hellenistic Greek at the New Brunswick Theological Seminary 1884–91. He has been a member of the American Testament Revision Committee since 1872. Among his works are: 'The Sure Foundation'; 'Praise Songs of Israel'; 'The Psalms,' a new translation; and 'What is Inspiration?'

Dewitt, John, American Presbyterian theologian: b. Harrisburg, Pa., 10 Oct. 1842. He graduated at Princeton 1861; took up the study of theology at Princeton Theological Seminary and at Union Theological Seminary, New York, and was ordained to the ministry in 1865. He has been pastor of several churches, professor of ecclesiastical history Lane Seminary, Cincinnati, 1882–8, and professor in McCormick Theological Seminary, Chicago, 1888–92. He has published 'Sermons on the Christian Life.'

De Worms, Henry, 1st Baron Pirbright, English statesman and writer: b. 1840; d. London 10 Jan. 1903. He was educated at King's College, London, was admitted a barrister of the Inner Temple in 1863, and sat in the House of Commons for Greenwich 1880–5, and for Tox-teth 1885–95. He was under-secretary of the colonies 1888–92. He published 'England's Policy in the East'; 'The Earth and its Mechanism'; 'The Austro-Hungarian Empire'; 'Memoirs of Count Beust.'

Dewsbury, England, a municipal and parliamentary borough in the West Riding of Yorkshire; 30 miles southwest of the town of York; on the Calder. Coal is mined, but the trade of the town is chiefly in heavy woolen cloths, including blankets, carpets, flannels, and worsteds. It has manufactories for fancy cloths and shoddy goods, contains iron and boiler works. Pop. of municipal borough 29,637; of parliamentary borough 74,349.

Dexter, Henry, American merchant: b. West Cambridge (now Arlington), Mass., 14 March 1813. He early established a connection with publishing firms in Boston and Cambridge, which was continued until 1836. He then went into the hardware business, remaining in this until 1842, when he took up the wholesale trade in books, periodicals and newspapers. He organized the American News Company in 1864, serving as president.

Dexter, Henry Martyn, American Congregational clergyman: b. Plympton, Mass., 13 Nov. 1821; d. New Bedford, Mass., 13 Nov. 1890. He was graduated at Yale 1840, and at Andover Theological Seminary 1844. He filled a pulpit in Manchester, N. H., 1844–9, and was pastor of Berkeley Street Church, Boston, 1849–67. He was one of the editors of the 'Congregational Quarterly' from 1859 to 1865, becoming editor-in-chief of the 'Congregationalist' 1867. He was a staunch defender of the Congregational polity and delighted in controversy. His principal works are: 'The Voice of the Bible and the Verdict of Reason' (1858); 'Congregationalism: What it Is, Whence it Is, How it Works, Why it is Better than Any Other Form of Church Government, and its Consequent Demands' (1865); 'Roger Williams and His Banishment From the Massachusetts Colony' (1876); 'The Congregationalism of the Last Three Hundred Years' (1881); 'Common Sense as to Woman Suffrage' (1885); 'Early English Exiles in Amsterdam' (1890).

Dexter, Samuel, American statesman and jurist: b. Boston 14 May 1761; d. Athens, N. Y., 4 May 1816. He was graduated at Harvard University 1781; was admitted to the bar in 1784. He was repeatedly chosen to the legislature of Massachusetts, and in 1798 was elected senator of the United States. While senator he was appointed secretary of war in 1800, and in the same year secretary of the treasury. He was afterward, at different times, offered foreign missions, but always refused them. About the year 1802 he withdrew from political life, and returned to his profession. He was an unsuccessful candidate for governor in 1814. He was the first president of the first society formed in Massachusetts for the promotion of temperance.

Dexter, Timothy, American merchant: b. Malden, Mass., 22 Jan. 1743; d. Newburyport 22 Oct. 1806. He succeeded in amassing a large fortune for those days. He developed certain eccentricities which gave him great notoriety, assuming the title of Lord Timothy Dexter. For example, he constructed odd and bizarre residences in Newburyport, Mass., and Chester, N. H. The grounds of the first house were adorned with thirty or forty colossal wooden statues of famous men. He included himself in the number. He also made an extraordinary collection of absolutely worthless paintings, in order to prove his knowledge of art, and supported a poet who was supposed to be ready to sing his praises upon occasions. He wrote a book called 'A Pickle for the Knowing Ones' and also a pamphlet with all the punctuation marks printed upon the last page, there being none in the text proper.

Dex'trin ($C_6H_{10}O_5$), a body obtained from starch, and very similar to it in composition; also called starch gum, British gum, etc. It resembles gum in being soluble in water, but is distinguished from that substance by composition, by being, like starch, converted into oxalic

acid by nitric acid, and not into mucic acid, and especially by causing a ray of polarized light to deviate to the right, a property from which it derives its name. It is prepared from starch by several processes. The transformation may be effected by dilute sulphuric acid at a temperature a little below that of boiling water. By acting upon starch with diastase (q.v.) dextrin is produced. To water at about 70° or 80° F., in a boiler, 8 or 10 parts of dried malt are added, and then 100 parts of starch after the heat is raised to 140° F. The mixture is kept stirred and the temperature maintained somewhat above this for 20 minutes, and then, when the thick mass has become quite fluid, it is raised to the boiling-point rapidly, cooled, the clear liquor filtered, and evaporated to a syrup. When cold it is an opaque gelatinous mass, which, on drying, becomes hard like gum. Dextrin is used in large quantities for thickening calico-printers' colors, for making adhesive paper and labels, and for postage stamps, as a varnish, and for many other purposes.

Dextrose, dĕks'trōs, grape-sugar, starch-sugar, or dextroglucose, $C_6H_{12}O_6$ or $C_6H_7O(OH)_5$. Dextrose occurs along with levulose in grapes and other sweet fruits, also in honey and in the urine of diabetic patients. It can be produced by the action of dilute sulphuric acid on cane-sugar, starch, cellulose, etc. It can be best obtained by boiling for several hours 50 parts of starch with dilute sulphuric acid (100 parts of water to 5 parts of H_2SO_4). The solution is then neutralized with chalk, filtered, boiled with animal charcoal to remove traces of color, and then evaporated carefully to dryness, forming an amorphous mass which contains about 60 per cent of dextrose, the remainder being chiefly dextrin. Pure dextrose can be obtained by crystallization from alcohol; it contains then one molecule of water of crystallization, and forms microscopic rhombic crystals, which soften at 60°, melt at 86°, and lose their water crystallization at 110°. Heated to 170° it is converted into glucosan ($C_6H_{10}O_5$). Dextrose tastes much less sweet than ordinary cane-sugar. By the action of sodium amalgam on dextrose it is converted into mannite, $C_6H_{14}O_6$. A solution of dextrose becomes brown when boiled with caustic alkalies.

Dey, dā (from Turk. day, maternal uncle, a title of dignity), a title formerly given in the 17th century to the Turkish commander of the army in Algiers. The office was attained by seniority. When the French captured Algiers in 1830, the title and office were of course abolished. The title of dey as given to the governor of Tunis has long been replaced by that of bey. There still exists a dey of Tripoli.

De Young, Michael Harry, American publisher; b. St. Louis, Mo., 5 Oct. 1848. He received a common school education and in 1865 established with his father the 'Dramatic Chronicle,' subsequently merged into the San Francisco *Chronicle*, of which he has been sole proprietor since 1880. He was commissioner from California to the Paris Exposition of 1889, vice-president of the World's Columbian National Commission in 1892, and director-general of the California Midwinter Exposition of 1893. In the last named year he was made vice-chairman of the Republican National Committee.

Dhalak, dä-läk', an archipelago of the Red Sea, off the coast of Abyssinia. It contains nearly 100 rocks and islets, mostly uninhabited, clustering round the island of Dhalak-el-Kebir. This island possesses a pearl fishery.

Dhar, där, India, (1) a small native state in the Malwa agency, in the central part of India, with an area of about 1,740 square miles. The soil is fertile, and yields rice and other cereals. Pop. 109,474. (2) The capital, of the same name, is situated about 180 miles east of Baroda, and contains some striking buildings, and a fort built of red stone stands outside the town. Pop. 18,430.

Dharangaon, där-äṇ'gä-ôn, India, city in the Khandesh district, Bombay, having a trade in cotton and oil-seeds, and manufactures of coarse cloth. Pop. 15,072.

Dharwar, där'wär, India, city, capital of a district of the same name, in the southern Mahratta country, in Bombay presidency. The city is a trade and dispensing station for the surrounding country. American cotton is raised successfully, and silk and cotton goods are manufactured in the district. Pop. 32,841.

Dhawlagiri, dą-wäl''ä-ghėr'ē, or **Dhaulagiri,** once supposed to be the highest peak of the Himalayas, has a height of 26,826 feet above the sea. It is in Nepal, in lat. 29° N., and lon. 82° 30' E.

Dhole, dōl, a local Indian name for the wild dog, native to parts of India. It is called "buansu" in the Himalayas. See *Wild Dogs,* under Dogs.

Dholera, dō'lėr ą, India, city in the Ahmedabad district of Bombay presidency, on a stream entering the Gulf of Cambay, an important cotton mart. Pop. 10,088.

Dholka, dōl'ka, India, city in the Ahmedabad district of Bombay presidency, probably one of the oldest towns in Gujerat. The weaving of women's robes is the principal industry of the town. Pop. 16,494.

Dhow, dow, an Arab sea-going vessel, ranging from 150 to 200 tons burden, with one mast, a yard the length of the vessel, and a large lateen or triangular sail. It is used for merchandise and is often employed in carrying slaves from the east coast of Africa to Arabia.

Dhulia, doo'lē-ä, India, the chief town of Khandesh district, Bombay presidency, situated on the south bank of the Panjhra River. There is a new and old town combined. It is a cantonment town. Pop. 21,880.

Dhurra, door'ra, or **Dourah,** Indian millet, the seed of *Sorghum vulgare*, after wheat the chief cereal crop of the Mediterranean region, and largely used in those countries by the laboring classes for food. Varieties are grown in many parts of Africa, one of them known as Kaffir-corn.

Di'abase, a word used by petrographers with varied meanings; but the present usage in this country restricts it to crystalline igneous rocks, of the basalt family, generally occurring as dikes, having as essential constituents plagioclase feldspar, augite and magnetite. Olivene may or may not be present. Diabases differ from the

granitoid rocks, to which they have a somewhat similar texture, in that the crystals of feldspar are long and narrow, or lath-shaped, and the dark silicates are arranged in the interstices of the felspar crystals, giving an ophitic texture. Diabases are of common occurrence in the United States. They form dikes and laccoliths at various places along the Atlantic seaboard from Nova Scotia to Georgia. The so-called traps of the Connecticut valley and the Palisades of the Hudson, are familiar examples. In the Lake Superior country diabases are of frequent occurrence; notably in the Marquette Iron Range and on Keweenaw Point; the latter sometimes carry native copper. The convenient field name greenstone, is frequently given to old, more or less altered, diabases. By pressure and shearing stresses, and the intrusion of other igneous rocks, diabases change to hornblende and chlorite schists, showing no trace of original structure. Such rocks are common in the Lake Superior region and elsewhere, along the Algonkian and Archæan rocks that characterize the formation of so much of northeastern North America. Diabases are of common occurrence in the Rocky Mountains also, and frequently, over deposits, are found along their contacts with sedimentary rocks, particularly limestones. The typical diabase of the Palisades contains: SiO_2 53.13; Al_2O_3 13.74; Fe_2O_3 1.08; Fe O 9.10; Ca O 9.47; Mg O 8.58; Na_2O 2.30; K_2O 1.03. The specific gravity is 2.96.

Diabetes (dī-ą-bē'tēz) **Insip'idus**, a chronic disorder, characterized by the production of large quantities of urine of low specific gravity. It is a disorder particularly of young people, and is more frequent in males than in females. In the larger number of patients it seems to be of congenital origin. Its exact nature is unknown, although it seems to be related to some disturbance of the vasomotor mechanism in the kidneys. As a rule it is a disease of slow onset, the early symptoms being an increasing thirst and the passage of large quantities of urine. Occasionally there are pains in the thighs; the appetite is usually good; there is much thirst; the perspiration is small in amount, and the skin is apt to be rough and harsh. Otherwise the patients suffer but very little. It is a disease that is rarely prejudicial to health, having been known to persist for 50 years, and occasionally it passes away without treatment. Treatment is unsatisfactory.

Diabetes Mel'litus, a disorder of nutrition, in which there is deficient oxidation of the sugar in the body, which permits of the storing up of large amounts of sugar in the blood. This is eliminated in part in the urine, and there constitutes one of the most positive findings of the condition. It is a rare disease in America, but is less so in European countries, where it is from three to five times as common as here, although statistics seem to show that it is on the increase in the United States. The symptoms vary very widely. There is an acute form of the disease which proves rapidly fatal, but in the majority of cases there is a gradual onset, during which increased urination and increased thirst are the initial symptoms. Following this, if the disease progresses, the thirst still increases; there is passing of large quantities of urine containing glucose; very marked increase in the appetite, amounting sometimes almost to voraciousness and gluttony; and an accompanying progressive emaciation. The skin is dry and harsh; temperature is often below normal; the tongue is bright red, and glazed; the gums may be swollen; and constipation is the rule.

As the disease progresses a number of complications are apt to arise; boils and pimples are extremely common; eczema and intense itching are frequent. Perforating ulcer of the foot may occur, and occasionally there is bronzing of the skin. Acute pneumonia is a frequent cause of death. Gangrene of the lung may also arise, and tuberculosis is contracted with great readiness. In most cases, particularly in the young, there is a form of progressive intoxication due to the gradual retention in the body of acids which are not properly neutralized by the body's protective agencies. There is gradually progressive anæmia, headache, delirium, great distress and marked hunger for air, which may be accompanied by blueness of the skin. Neuralgic pains are also frequent complications in diabetes.

The cause of diabetes mellitus is a matter of much inquiry, but it would seem that it is a disease of a number of origins. Fundamentally, however, it is due as implied at the beginning of this article, to some interference with the physiology of sugar-oxidation. This may result from disease of the pancreas, disease of the suprarenal gland, sometimes disease of the central nervous system, and occasionally disorder of the sympathetic system. The pancreas and the suprarenals are considered at the present time as the site of the chief changes leading to the production of this disease. The outcome is usually dark. In children, as a rule, it progresses rapidly to death. Middle-aged people may live for many years, but instances of cure in true diabetes are rare. The treatment is largely hygienic, and is extremely complicated. Diet and hygiene are the most important factors. Each patient having his idiosyncrasies, medical advice on the matter of diet is imperative. The patient, not the disease, needs treatment; hence general rules are more productive of harm than of good.

Diabet'ic Sugar ($C_6H_{12}O_6$), formerly supposed to be a distinct species of sugar, now found to be the same as glucose (q.v.). It is regularly produced by the liver, and is a constant though trifling constituent of healthy urine, but in diabetes mellitus (q.v.) it amounts to 8 or 10 per cent. See INOSITE.

Diablerets, dē-ä-blē-rā', **Les** (Fr. "the little devils"), a secondary mountain group of the Bernese Alps, Switzerland, between the canton Vaud and canton Valais. The highest peak is 10,620 feet. Two peaks have already fallen, and others threaten to follow. The rocks consist of limestone, resting at a high angle on beds of shale, which becoming disintegrated leaves the limestone without support, and causes tremendous landslips. The most disastrous took place in 1714 and 1749. By the former the surrounding district was shaken as by an earthquake, and many human beings and cattle perished; by the latter the course of the Liserne was arrested, and two small lakes formed.

Diacaustic (dī-ą-kâs'tīk) **Curve**, a curve of intense light, formed by the consecutive intersections of rays refracted through a lens,

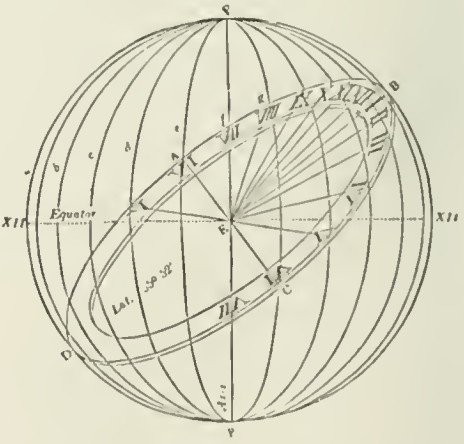
Diachylon, dī-ăk'ī-lŏn, a combination of oxide of lead or litharge, olive oil, and water. It is, in fact lead soap, insoluble in water, and sparingly soluble in alcohol, hard and brittle when cold, but soft on heating. It is used in surgery as the basis of adhesive plasters.

Diadem, a band for holding together the adjusted hair of the head, a wreath or chaplet for the head or forehead. In Oriental antiquity it was employed as a badge of royalty or nobility among the Egyptians, Assyrians and Babylonians. It was called *nezer* among the ancient Jews, and was worn as an ornament by kings and high priests, when it took the form of a golden circlet for the brows. Among the Persians, Armenians, and Parthians, the kingly and queenly diadem was a broad band of pale blue. Alexander the Great adopted this regal decoration after contact with the Persians, and his successors followed his example in this fashion. The Greeks early adorned their greater gods with the diadem, notably Zeus, Hera and Aphrodite, and it later became the universal ornament of their women, and their young men, especially the Olympic victors. These diadems were made of such various materials as metal and leather. Among the Romans Ancus Martius introduced the diadem from the Etruscans, but it was abolished on the expulsion of the kings. Which of the Cæsars revived its use is not known. According to some authorities Aurelian first assumed it. Its use among the non-Roman kings and princes of Europe appears to have been universal. Under Constantine the Great the imperial diadem was studded with gems and took a form which rendered it the prototype of the crowns worn by mediæval and modern monarchs.

Diæresis, dī-ĕr'e-sĭs, in grammar, the resolution or separation into distinct syllables of two vowels whose juxtaposition has either caused them to coalesce or threatened them with coalition. In printing, a mark (¨) placed over the second of two adjacent vowels to indicate that they should both be pronounced: as, aërated.

Diagno'sis (Gr. from *dia*, through, and *gnōsis*, knowledge), in medicine, the discrimination of diseases. It includes the study of all the vital phenomena of diseases, and also of their appearances after death, in so far as this can aid their discovery during the life of a patient. It is usual to speak of rational or physiological diagnosis, or diagnosis by symptoms, that is, changes chiefly functional, observed by the patient; and of physical diagnosis, or diagnosis by signs, that is, objective phenomena appreciable by the senses of the observer. The latter method of diagnosis has been much enlarged in scope and increased in importance by the modern methods in medicine of auscultation and percussion (qq.v.) and also by the great advances made in physiological chemistry, and by the use of the microscope. Skill in diagnosis is one of the highest gifts of the physician.

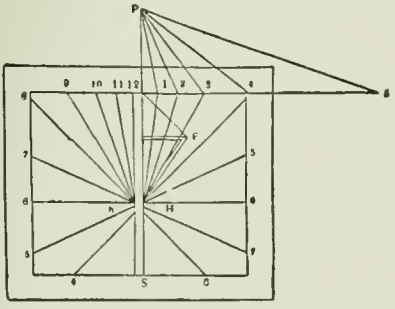
Diag'onal, Diagonal Line, a straight line joining two angles not adjacent, in a rectilinear figure. Every rectilinear figure of more than three sides may be divided by diagonals that do not intersect, into as many triangles as it has sides, minus two. To find the number of possible diagonals, take three from the number of the sides, multiply the remainder by the number of the sides, and halve the product.



Diagoras (dī-ăg'ō-ras) **of Melos,** Greek philosopher, d. Corinth about 412 B.C. He was a pupil of Democritus of Abdera. On account of his ridiculing the popular religion, he was charged with impiety, and received the surname of the Atheist. Fearing for his life, he fled from Athens and went to Pallene, and finally to Corinth.

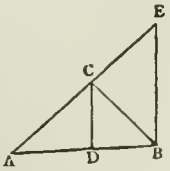
Diagram, a figure or geometrical delineation applied to the illustration or solution of geometrical problems, or a description or sketch in general. Anciently, it signified a musical scale. Among the Gnostics the name diagram was given to a figure formed by the superposition of one triangle on another, and inscribed with some mystical name of the Deity, and worn as an amulet.

Dial, The, a famous American quarterly, the recognized organ of the Transcendentalists. It was published in Boston 1840–4. Its first editor was Margaret Fuller, 1840-2, assisted by George Ripley and Emerson, and for the remainder of its course it was edited by Emerson. It was reissued in 1902 with introduction by G. W. Cooke.



Dial, Sun, an hour-measuring instrument known from the earliest times to the Egyptians, the Chaldæans, and the Hebrews. The Greeks derived it from their eastern neighbors, and it was introduced into Rome during the first Punic war. The leading principles of dialing may be made intelligible to general readers by the following simple illustration.

Let P B *p* D represent the earth as a hollow transparent sphere, having an axis P E *p*, of



which P and *p* are the poles. Let the equator be divided into 24 equal parts, and through these divisions draw the meridians, *a*, *b*, *c*, *d*, etc. Let one of these meridians pass through any given place for which a dial is required to be made, and where that meridian cuts the equator let it be numbered XII. The opposite meridian must likewise be numbered XII, the other meridians being numbered as shown in the cut. This being done, these meridians will be the hour circles of the place on the first meridian; so that if the axis P E *p* were opaque, the sun

in his (apparent) motion round the earth in 24 hours will pass from one meridian to another in one hour, and cause the shadow of the axis to fall on the hour on the plane D C B A. This diagram has been drawn for the latitude of Glasgow, 55° 52′, and the plane in its present position would form a horizontal dial for that place; but we may suppose it capable of moving round its axis A C, so as to assume different

positions in the sphere. If it move round so as to become vertical, that is, at right angles to its position in the figure, we then obtain an erect south dial. The plane may also be made to incline from the meridian either toward the east or west. Thus we have dials of different kinds dependent on the position of the plane with regard to the first meridian, the position of the hour lines of which are all determined by the meridians of the sphere cutting the plane.

We have been considering the earth as the sphere, in our illustration of the nature of dials, but the earth's magnitude is so small compared with the distance of the sun, that no sensible error will follow in considering a small glass sphere similar to that above described, but placed on the surface of the earth with its axis parallel to that of the earth; then will the sphere show the hour of the day in the manner before specified. The only things absolutely essential for a dial are the axis and the plane, the places of the hour lines having been once determined. Dials may have various forms, many of which are exceedingly curious and intricate, and require for their construction the application of complicated trigonometrical formulæ. We shall confine our attention here to the most common, and, at the same time, most useful form, that is, the plane horizontal dial. On the proposed plane, which may be either of marble, slate, or brass, draw the straight line P H S for the meridian or 12 o'clock line, and parallel to this draw 12, h S, leaving a space between them equal to the thickness of the gnomon. The gnomon is a thin triangular plate of metal, somewhat similar in shape to the figure A E B, the side A B being fixed into the plate of the dial, so that the gnomon shall stand perpendicularly, the line A E being directly north and south. The line A E is called the style, and the angle E A B is equal to the latitude of the place for which the dial is constructed.

We return again to the consideration of Fig. 2. Draw 6 H 6 perpendicular to 12 H S, and it will be the 6 o'clock hour line; make the angle 12 H F equal to the latitude of place, and draw 12 F perpendicular to H F; continue S 12 to P, making 12 P equal to 12 F. The line 12 1 2 3 4 is drawn parallel to the line 6 H 6. From the point P draw the lines P 1, P 2, P 3, etc., terminating in the line 12 1 2 3 4, making angles with the line 12 P at the point P of 15°, 30°, 45°, etc., increasing by 15 degrees each line. Next from the centre H draw the lines H 1, H 2, H 3, etc., and thus the hour lines of 1, 2, 3, 4, and 5 P. M. will be found. The hour lines on the other side of the style should now be formed by taking a tracing of the side already formed; the hours are of course numbered differently, and both sides will stand thus, the hour line of both sides corresponding:

$$12, \begin{matrix} 1, & 2, & 3, & 4, & 5, & 6, & 7, & 8, \\ 11, & 10, & 9, & 8, & 7, & 6, & 5, & 4. \end{matrix}$$

Here we have carried the hours beyond 6, which was the extent of the construction; but to find the hour lines for 4 and 5 in the morning we have only to produce the hour lines of 4 and 5 in the evening, and in like manner for the hour lines of 7 and 8 in the afternoon, produce the hour lines of 7 and 8 in the morning. The dial gives solar time, and, therefore, the time, according to it, will only agree four days in the year with a well-regulated clock. See EQUATION OF TIME.

The sun-dial is daily getting more rare in this age; but notwithstanding the superiority of the clock, why has the dial almost everywhere vanished? "If its business use," as has been well observed, "be superseded by more elaborate inventions, its moral use, its beauty, might have pleaded for its continuance. It spoke of moderate labors — of pleasures not protracted after sunset — of temperance and good hours. It was the primitive clock — the horologe of the first world. Adam could scarce have missed it in paradise. It was the measure appropriated for sweet plants and flowers to spring by — for the birds to apportion their silver warblings by — for flocks to pasture and be led to fold by. The shepherd carved it out quaintly in the sun, and, turning philosopher by the very occupation, provided it with mottoes more touching than tombstones."*

Dialect, a local variation of language. The common meaning of the term dialect, in modern times, is the language of a part of a country, or a distant colony, deviating either in its grammar, words, or pronunciation, from the language of that part of the common country whose idiom has been adopted as the literary language, and the medium of intercourse between well educated people. In ancient times, when the great difficulties in the way of intercourse and communication between different parts of a country prevented, or at least impeded, the formation of a general language, each dialect was developed independently of the others, until some event gave to one the ascendency. In Greece we find four distinct dialects: the Ionic, Attic, Doric, and Æolic, each of which gave birth to literary productions still extant, until at last the greater refinement, and the cultivation of arts and sciences in Athens, gave the Attic dialect the superiority.

Although the use of provincial dialects becomes inconvenient after a language has

* "*Horos non numero nisi serenas*" ("I only count the hours of sunshine") was an ancient dial-motto of great beauty and significance.

acquired a fixed literary standard, the study of such dialects is always valuable to the philologist for the light they throw on the history of the language.

Italian was once the vulgar dialect; and, even now, to translate into Italian is called *volgarizzare*. It was corrupt Latin mixed with barbarous words derived from the idioms of the conquerors of the country, and was used at first only by the lower classes; it then became the general dialect of common life; and at last Dante dared to adopt the "vulgar dialect," and to stamp it as a legitimate language.

Spanish and Portuguese were cognate dialects, and might, like the different dialects of the Spanish provinces, have become one language, if the two nations had not been separated politically.

In Germany no dialect has ever attained entire ascendency. Charles V., born at Ghent, spoke Low-German; but Luther's translation of the Bible, like Dante's 'Divina Commedia,' made High-German the literary language. Only the fundamental characteristics of the language of Upper Germany have remained in High-German.

Of English there are but two distinct literary dialects, the modern English and the Scottish, which is derived from the same Saxon stock. It has often been observed, however, that no country has more variations from the common literary language. The Scottish dialect exists in its purity only in the early poets, historians, and other writers of the country. Every county has its peculiarities, which are sometimes striking and difficult to be understood. It is evident that, although there never has existed a country so vast, and a population so large, as that of America, with so little variety of dialect, the work of development and decay is palpably going on in American Anglo-Saxon. To begin with, the dialect of the French Canadian is vivid and picturesque. That there are several distinct dialects in the United States is proved not only by the dialect literature of the East, the West, and the South, and dialect of the slums in New York, but also by the scientific publications of the American Dialect Society. The 'Dialect Notes' of this society furnish much valuable information on this subject, and 'The Ithaca Dialect,' in which a local New York State dialect has been investigated by O. F. Emerson shows that the differentiations of language in distinct sections will some day furnish abundant and interesting material for the student of dialect.

Dialectic, the art of separating a subject into its parts by discussion. It thus includes both the use of reason and speech, and is the process of defining an idea or principle and testing the definition by showing all the consequences, both positive and negative, that it involves.

Aristotle is reported to have said that Zeno the Eleatic was the father of dialectic. The justification of this remark is found in the fact that Zeno defends the position of his school by showing through a process of reasoning the absurd and contradictory results that follow from the conceptions defended by their opponents. With Socrates dialectic is an art of investigating a subject by means of conversation carried on by two or more persons, each of whom contributes something to the result, proposing definitions, or calling attention to certain aspects of the subject, or certain negative cases that had been overlooked. Thus Xenophon ('Memorabilia,' Chap. v.) tells us that Socrates said that dialectic was so called because it is an inquiry pursued by persons who take counsel together, separating the subjects considered according to their kinds. Plato extends the use of the term and makes it the art of working up by a methodological procedure of thought to a knowledge of the highest principles of things. As he says ('Republic,' bk. v.), it is the method by which "reason avails itself of hypotheses not as first principles, but as genuine hypotheses, that is, as stepping-stones and helps whereby it may force its way up to something not hypothetical and arrive at the first principles of all things and seize it in its grasp." For Plato then dialectic is the term used to describe all logical thinking. Aristotle, however, does not use the term to cover his art of logical demonstration from necessary principles, but ascribes to it a lower place, describing it as the method of dealing with what is merely probable, or of arriving at what is most likely to be true in cases when certain demonstration is impossible.

The term dialectic has also frequently been used both in ancient and modern times to denote an empty or sophistical art of playing with words or operating with concepts that have no real meaning or content. Thus Kant in the 'Critique of Pure Reason' employs the word in this sense to denote "the false pretense of knowledge that is based on illegitimate concepts that have no real basis in experience." He names the third main division of his work 'Transcendental Dialectic,' and devotes it to a systematic exposure of the emptiness and futility of this form of reasoning. Hegel, on the other hand, uses the term to describe the true method of the development of thought. According to him there is in thought an internal principle of development in virtue of which it moves through three stages — from a thesis or positive position to the antithesis or negative view that is contradictory of the starting-point, then finally to the synthesis or reconciliation of the two opposing views. Hegel develops this into a universal method of procedure, regarding it as a process that exhibits both the development of the thought-process and also the nature of reality, and pointing out illustrations of its course in history and in many departments of life and thought.

J. E. Creighton,
Professor of Philosophy, Cornell University.

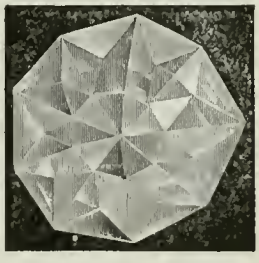
Di'alogue, a conversation or conference between two or more persons. The dialogues of Plato are a sort of philosophical drama. The Socratic dialogue consists of questions and answers, and the person questioned is obliged, by successively assenting to the interrogatories put to him, to come to the conclusions which the questioner wishes to produce. The Socratic method has been adopted in modern times as a means of instruction in certain schools. Lucian claimed to be the inventor of humorous dialogue (see Dialogues of the Dead). Erasmus of Rotterdam, and subsequently, among the Germans, Lessing, Moses, Mendelssohn, Engel, Herder, Jacobi, Solger, have written in this form. In comic and satiric dialogue Wieland has imitated Lucian. Among the most distinguished Italian

writers of dialogue are Petrarch ('De vera sapientia'), Machiavelli, Gelli, Algarotti, and Gozzi; and among the French, Sarrasin, Malebranche, Fénlon, and Fontenelle. Among the English, Bishop Berkeley and Hurd have imitated Plato, and Harris, Cicero. Lord Lyttelton's 'Dialogues of the Dead,' and Addison's 'Dialogues on Medals,' are well known, but Landor's 'Imaginary Conversations' is the finest production in English belonging to this class of works. In the drama, the dialogue, in a narrower sense, is opposed to monologue or soliloquy; in the opera, it is that which is spoken, in opposition to that which is sung.

Dialogues of the Dead, satirical dialogues by Lucian (q.v.), written at Athens during the latter half of the 2d century. They have been frequently translated from the days of Erasmus to the present. The scene is laid in Hades. Among the characters introduced or referred to are: Menippus and Diogenes, the Sophists, and the Cynics, Aristotle, Alexander, Socrates, and Crœsus. The decadent Olympian religion is exposed to ridicule, and it is demonstrated that the conception of fate logically destroys moral responsibility. In the dialogue regarding Charon and his passengers, the futility of riches and fame is shown, only sterling moral qualities availing in the shadowy land of Hades. Lord Lyttelton also wrote 'Dialogues of the Dead,' introducing some modern *dramatis personæ*, including Cortez, William Penn, Ximenes, Wolsey, Boileau, and Pope; and Fontenelle's 'Dialogues des Morts' should be noted as embodying a similar idea.

Dial'ysis, the separation of the crystalloid constituent elements of a mixture from the colloid, the former being bodies which diffuse readily, such as sugar, salt, bichromate of potassium, etc.; the latter bodies which diffuse with difficulty or not at all, bodies resembling glue or gelatin, such as gum, starch, caramel, albumen, the ordinary constituents of food, etc. The dialysis is effected by pouring a mixed solution of crystalloid and colloid on a sheet of parchment paper stretched over a wood or gutta-percha hoop, having its edges well drawn up, and confined by an outer rim. The parchment is allowed to float on a basin of water. In a short time all the crystalloid bodies will have passed through the membranous septum into the pure water, while the colloid matter will remain almost entirely in the dialyzer.

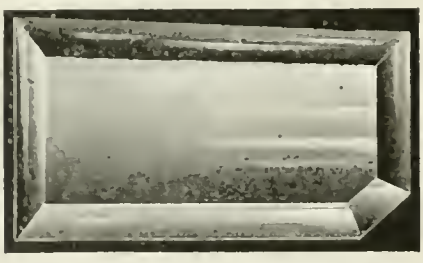
Diamag'netism, the moving of bodies such as iron, when placed in a field of magnetic force, from places of weaker to places of stronger force. The opposite is true of bismuth and other substances. Such substances are said to be diamagnetic. See MAGNETISM.



Diamantina, Brazil, a city lying somewhat north of the centre of the state of Minas Geraes, in a region formerly well known on account of its abundant production of diamonds. At the present time the wealth of the state is derived from agricultural and manufacturing industries; nevertheless Diamantina continues to prosper, being well situated with reference to the São Francisco River system, and the routes of travel between Rio de Janeiro and the interior. Its climate is good, owing to its elevation above sea-level (about 4,000 feet). Pop. (1901) 14,000.

Diam'eter, a straight line drawn through the centre of a circle, and terminated both ways by the circumference. It thus divides the circle into two equal parts, and is the greatest chord. The radius is half this diameter, and consequently measures the distance between the centre and circumference of a circle. The length of the diameter is to the length of the circumference of the circle as 1 is to 3.14159265 . . ., the latter number being an interminable decimal.

Diamond, a natural form of carbon, highly valued as a precious stone when transparent and of the crystalline form. It is of less value than the ruby, and rubies of from two to four carats are frequently worth twice or four times the value of fine diamonds. A diamond crystallizes in the cubic or monometric system, its common form being the regular octahedron or a modification of it. The faces are often curved and the general form of the crystal is more or less rounded. The surface of the diamond frequently exhibits striæ and triangular impressions, while the interior may contain microscopic cavities and various inclusions, often black carbon. It is the hardest substance known, but in spite of this hardness it is very brittle and cleavable; specific gravity, 3.52. It is generally colorless, but sometimes tinged with pink, red, orange, yellow, green, blue, brown, or black. Blue, red, and green are exceedingly rare colors. The finest deep red diamond known is that in the possession of the Russian crown, purchased in the time of the Emperor Paul of Russia. Light yellow, straw, and brown are the most common colors; rich yellow and browns are also highly prized. Some bluish-white Brazilian diamonds are phosphorescent in the dark after exposure to the sunlight. The color is attributed to the presence of a possible hydrocarbon, called Tiffanyite. This phosphorescence is a property peculiar also to alizarin. The brilliancy of the gem is caused by the black planes reflecting all the light that strikes them at an angle exceeding 24° 13′. The index of refraction is 2.439, being exceeded only by that in chromate of lead and orpiment. The diamond is unaffected by any liquid and infusible at the highest attainable temperature. It gradually burns away before the oxy-hydrogen blowpipe, or in the electric furnace, or when it is heated red-hot and plunged into an atmosphere of oxygen, carbonic acid then being produced. Exposed to the intense heat of the voltaic arc, the diamond becomes converted into graphite. Be-



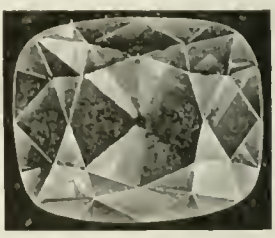
Natural Crystal.

Florentine Crystal.

sides its value as a gem it is of great use in the arts and manufactures. Diamond dust is used for cutting and polishing other gems, for slicing gems of all kinds, agate, jade, and other hard substances. The edge of a native crystal rounded is used by glaziers for cutting glass, for engraving glass, steel, and other substances; the cut is generally to a depth of only 1-100 of an inch, but determines the direction in which the glass shall break; a cut of this depth, while scarcely showing, breaks well, whereas a deep scratch does not. A sharp point is used for engraving on glass and other hard substances; a splinter is also used as a tool for turning glass lenses in a lathe; and rough diamonds, too imperfect to be used as gems, are mounted as boring tools for perforating the softer rocks. In the amorphous black variety, carbon, carbonado, or bort is used for boring hard rocks; it sells for $30 a carat, the value per carat of a fine transparent rough diamond of from one to two carats, as scarcely 33⅓ to 40 per cent of the crystals is left in the gem after the operation of cutting.

Originally diamonds were preserved in their natural form, but in 1456 Louis de Berguin or Bruges discovered the art of polishing them on rotating disks with diamond dust. These circular disks, about 10 centimetres in diameter, are of soft steel covered with diamond dust and oil, and made to revolve at 3,000 revo-

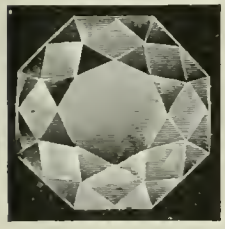
Great Table Stone of India.



lutions a minute. This gives the diamonds the artistic smooth surfaces and sharply defined edges. They are secured in a fusible metal dop or holder, held by a metal clamp to the wheel. The process is slow and tedious, and requires great skill to produce fine results. Until a few years ago Amsterdam was the great diamond-cutting centre of the world, but the finest cutting is now done in the United States, and in a great measure by machinery. As to the cutting process: Diamonds are, first, cleaved; that is, along the line of cleavage of the stone a tiny cut is made by rubbing the stone with another diamond at the point where it is desired to cleave it, then a dull knife-edge is placed in the cut, and a sharp blow will separate the stone on a cleavage plane. Secondly, diamonds are cut by rubbing two diamonds together ("diamond cut diamond," as the old adage says), the stones being cemented with shellac to two pieces of wood or handles which are held in the hands, and rubbed together till they are of the desired form. This also has been superseded partly by an American machine. The diamond-cutting trade is carried on by 8,000 jewelers, and over 30,000 people are employed in preparing and setting the gems. A "rose" diamond is one which is quite flat underneath, with its upper part cut into 12 or more little faces or facets, usually triangles, the uppermost of which terminates in a point. A "table" diamond is one which has a large rectangular face on the top, surrounded by four lesser rectangles. A "brilliant" diamond is one which is cut in faces both at top and bottom, and the table or principal face of which is flat; there are 32 faces on the top above the girdle, and 24 on the back, exclusive of the table on the top and the inlet on the back, 58 in all. The greatest amount of brilliancy and beauty is developed in the diamond by the "brilliant cut"; 98 per cent of all modern cut diamonds are cut in this form. Very few are at present "rose cut" or "table cut," though rose cut has been more or less in vogue from the 17th century; table cut was in vogue during the 15th and 16th centuries. The finest brilliant in the world to-day is the "Jubilee" diamond, shown at the Paris Exposition of 1900; this was a brilliant of 239 carats of wonderful brilliancy and purity, and was found at the Jagersfontein mine in South Africa.

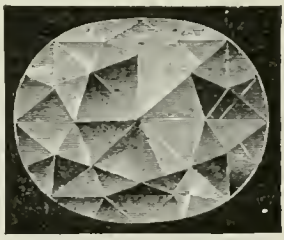
The Shah.

Diamonds of from 1 to 22 carats each have been found in 24 localities in the United States. The combustibility of diamonds was proved in 1694 by Averani and Targioni with the aid of burning glasses. That diamonds turned to carbonic acid when burned was proved by Lavoisier in 1772. Many curious superstitions are connected with the diamond. It was supposed to show phenomena of sympathy and antipathy. It was fallaciously believed that the diamond, which resisted the two most powerful things in nature, iron and fire, might be destroyed by the blood of a goat; that, if it was macerated in fresh blood, it could not be destroyed by being struck on an anvil, etc. It was believed also to show a curious rivalry with the magnet, to strengthen poisons, and sometimes to drive away madness.



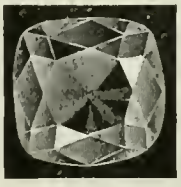
That the diamond was known to the ancients is extremely problematical. Only two diamonds are mentioned by Castellani as existing in antiquity in a small gold statue, and even this allusion is doubtful. Therefore we may safely say that when the Prophet Jeremiah speaks of diamonds under the name of shamir as a tool for engraving; when Ezekiel and Zechariah compare the stubbornness of the Israelites to the diamond, and when the Greeks and Romans speak of the stone under the name of adamas or adamant, the "unsubduable," the stone referred to was really the corundum. There does not exist in a single antiquarian collection in Europe a stone of the mineral which we now call diamond; the earliest authentic specimen known

Star of the South.



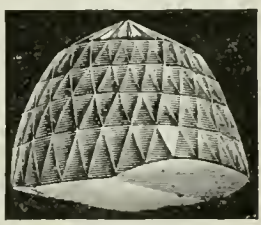
being the stone set in the ring of Charlemagne, an octahedral diamond. Any other reference can only mean the corundum or sapphire, the stones which are next in hardness to the diamond, and which could both have been used for engraving nearly all the gems of the time. Pliny mentions this stone as being the most valuable of the possessions of man.

Authors and composers of Eastern tales long wrote of diamonds as being found in India only, and chiefly in the mines of Golconda — a misnomer, as Golconda was the market, not the mine; and diamonds from many mines were sold there. But ever since the year 1728 these stones have been found in great abundance in Brazil, no less than 1,146 ounces having been taken from there to Europe in 1730. In 1829 a vein of diamonds was discovered in the Ural Mountains; and in 1867, in South Africa, John O'Reilly, a trader and hunter, reached the junction of two rivers, and stopped for the night at the house of a farmer named Van Niekerk. Children were playing with some pebbles they had found in the river. O'Reilly took one of these pebbles to Dr. Atherstone at Cape Town, who said that it was a diamond of 22½ carats. It was sold for $3,000. Niekerk remembered that he had seen an immense stone in the hands of a Kaffir witch-doctor, who used it in his incantations. He found the man, gave him 500 sheep, horses, and nearly all he possessed for the stone, and sold it the same day to an experienced diamond buyer for $56,000. This was the famous "Star" of South Africa. It weighed 84½ carats in the rough, and was found to be a gem quite the rival of an Indian stone in purity and brilliancy. After it had been cut it was bought by the Earl of Dudley, and is now known as the Dudley diamond. By 1869, parties in ox-wagons had worked their way over the plains to the Vaal River. Soon a tented city of 12,000 or more foreigners grew at Pniel and Klipdrift, on the opposite banks of the stream, where diamonds were found plentifully. Soon hundreds of cradles, like those used by the Australian gold-diggers, were rocking on the edge of the stream, supplied with the precious gravel by a large force of diggers, sievers and carriers. The mines at Kimberley, 600 miles from Cape Town, are of exceeding value, the richest in the world. The output of a single mine, the "Kimberley," is $4,000,000 annually, and within 10 years this district has yielded about $58,000,000 in dividends. Ninety-five per cent of all the diamonds produced in the past 20 years came from South Africa; of these over 90 per cent came from the De Beers mines, limited, a consolidation of all the African mines in and about Kimberley; 5 per cent from the Orange River Colony and elsewhere, the latter usually of great purity. The capitalization of the De Beers mines is at the present market value about $100,000,000.



The Pasha of Egypt.

Most of the miners are natives, who are kept in compounds for periods of from three to six months; this system has broken up the illicit diamond buyers' ("I. D. B.") system, which seriously threatened the successful working of the mines. The chairman of this syndicate was Cecil J. Rhodes (q.v.), who by his genius and will created the corporation apparently out of chaos, and regulated the value of diamonds for over 12 years, the result being of great benefit to the jewelers of the world. The buying and selling of the gems is controlled by the government. Since the organization of the De Beers mine, in 1888 to 1 Jan. 1900 there have been mined 35,000,000 loads of earth of 1,600 pounds each; these have yielded 31,000,000 carats of diamonds, valued at $200,000,000. The total African yield from the opening of the mines to the present is about $350,000,000, after cutting $700,000,000 worth of diamonds. Since 1867, duty has been paid on $240,000,000 worth of diamonds and precious stones, and it may be safely said that $500,000,000 worth are owned in the United States.

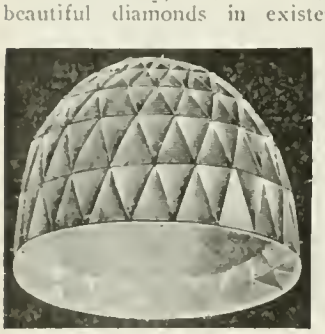


The Kohinur.

The Polar Star.

The total value of all the diamonds known to exist in the world to-day is at least $1,000,000,000. Therefore it may safely be said that one half of all the diamonds known are owned in the United States.

Most of the great diamonds distinguished for beauty and size have very interesting histories. One of the most famous is the Kohinûr, or Koohinoor, "Mountain of Light." The legend is that it was carried 5,000 years ago by the hero Karna, whose deeds are celebrated in the "Mahabharata." It made its first appearance in history in the 14th century, when Ala-ed-din brought it to Delhi. At that time it was supposed to weigh 793 carats. When in 1673 the Grand Mogul sold it to Tavernier, it weighed only 279 carats, having been injured by the lack of skill of a Venetian lapidary. It was brought in 1739 at the sack of Delhi to Afghanistan. Thence it came into the possession of the East India Company, which presented it in 1850 to the English crown. It was recut in 1852 and now weighs 106 1-16 carats.

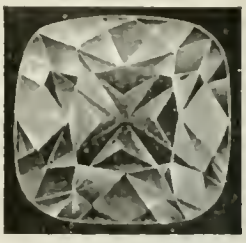


The Orloff.

What is said to be the largest stone in the world was sent to London from the Jagersfontein mines in South Africa in 1893. It weighed 971 carats or nearly half a pound, and was three inches in length. It is in process of being cut in Amsterdam, and is of a fine color. Another

weighed 640 carats. A pre-historic diamond mine is believed to have been discovered near Winburg in the Orange River Colony, a hundred feet in depth and with tunnels branching off for several hundred feet. In these were found primitive tools, armor and weapons, and the skeletons of men who must have been above the average stature of any race of the present day. The natives have no traditions concerning them.

Another important diamond is the one at the point of the sceptre of the Russian empire, known as the Orloff, which weighs 194¾ carats. At one time it formed the eye of an idol in the temple of Seringham in Mysore, whence it was stolen. It was in the throne of Nadir Shah, and after his murder it was bought by an Armenian merchant in 1772 at the price of 450,000 silver rubles and the title of nobility. By the gift of Prince Orloff, a favorite of Catharine II., from whom it derived its name, it came into her possession. Some writers think that this and the Koh-i-Nür are the two parts of the "great mogul" diamond. The supposed great diamond of the king of Portugal, 1,770 carats, is a rolled oval pebble of white topaz.



The Regent or Pitt diamond was, till the recent opening of the South African mines, for over a century, one of the most perfect and beautiful diamonds in existence. It weighs 136.75 carats, and is of the purest water and most perfect shape. It came from the East Indies and was sold by a sailor to Pitt, governor of Ft. St. George. From him it came into the hands of the Duke of Orleans at the time of the French revolution. It was in pawn at the hands of a merchant by the name of Trescow. Afterward it decorated the sword hilt of Napoleon I., and is now in the Galerie d'Apollon in the Louvre.

The Great Mogul.

One of the finest of diamonds is the Sancy diamond, 53½ carats, of exquisite shape and perfect water. It has been traced back to Charles the Bold, who lost it in 1477 at the battle of Nancy. It came through many private hands to the Huguenot nobleman Sancy. When Sancy was sent as an ambassador to Solothurn, he received from Henri III. the command to send to him that diamond as a pledge. The servant to whom it was entrusted was attacked and murdered, but instead of giving up the diamond he swallowed it. Sancy had the body opened and found the precious diamond in his stomach. James II. procured it when he came to France in 1688. Later it came into the possession of Louis XIV. and was worn by Louis XV. at his coronation. In 1835 it was sold to the Russian emperor for 500,000 rubles. In 1865 it came into the hands of Sir Jamsetjee Jeejeebhoy, and in 1889 was again in the market; the price asked was 100,000 rubles. It is owned by a collector, who paid $70,000 for it.

One of the most superb diamonds known is the sapphire-blue brilliant Hope diamond, valued at about $100,000. It is believed to have been cut from a blue diamond weighing in the rough 112½ carats, sold by Tavernier to Louis XIV., and which disappeared in the troubles of 1792. The largest diamond ever found in Brazil weighed 254½ carats, and was discovered in 1853 by a negress in the river Bogageno; it is known as the "Star of the South." It was sold to the Gaekwar of Baroda for $450,000.

The Regent or Pitt.

From 1750 to 1870 the value of a diamond was fixed on a basis of the square of its weight; that is, a 1-carat stone was worth $100, a 10-carat stone was worth — 10 x 10 x 100 — $10,000. This was due to the fact that large stones were rare. But in the African mines, large stones are found, and the increase in value from one carat up is worth only a fraction more per carat than the carat weight would show. When brilliants are exceedingly small the value per carat may be double that of stones weighing one sixteenth to one fourth carat each, owing to the difficulty of cutting. The term "first quality" signifies a stone absolutely white and free from all flaws and imperfections. Imperfections, even if slight, or a tint of undesirable colors, greatly lower the value of a diamond.

As the diamond is known to be nothing but a crystalline form of common carbon, many attempts have been made to manufacture it by artificial means. No great degree of success has yet rewarded these efforts, although very small diamonds of apparently good quality can be prepared by methods now known. Carbon being practically infusible, it has not been found feasible to induce crystallization by causing the carbon to solidify from a molten condition. Free carbon is soluble in but few substances, and from such solutions as can be prepared it is deposited mainly in the form of graphite. It dissolves to a considerable extent in melted platinum, but when the metal is allowed to cool and solidify, the carbon is all thrown down as graphite, and no diamonds are obtained. Of the more successful experiments of this sort, those of Moissan are best known. Moissan made use of the known fact that carbon will dissolve to some extent in melted iron. Under ordinary conditions the carbon is here also deposited in the graphitic form; but Moissan found that when the solution is allowed to cool under an exceedingly great pressure a small portion of it appears in the form of minute crystals that possess all the properties of the true diamond, even exhibiting the peculiar pittings on the surface that are characteristic of the natural stone. His method consists in saturating the molten iron with carbon and then pouring it into a mold, and chilling the casting

The Sancy.

as quickly as possible by immersing it in water. The outer layers solidify under this treatment, while the interior is still quite fluid, and the powerful contraction of the surface gives rise to an enormous internal pressure. As the fluid core solidifies, the greater portion of the carbon that it contains is deposited in particles that are distributed throughout the mass. The casting, when entirely cool, is dissolved in acids, and the residue is treated in various ways to effect the removal of the graphite and amorphous carbon. A small precipitate remains behind, in which tiny crystals of diamond may be distinguished. No stones that are large enough to be of commercial value have yet been prepared, and while the process is of great theoretical interest, it is far too expensive, in comparison with the yield, to be practicable even for the manufacture of diamond powder for polishing and grinding purposes.

GEORGE F. KUNZ.

Diamondback Terrapin (*Malaclemmys palustris*). This far-famed turtle belongs to the family *Emydidæ* (q.v.) and may be recognized by the unhinged plastron or lower shell, the concentric grooves and ridges which mark each plate of the upper shell or carapace, the smooth unnotched jaws, smooth skin covering the head, and dark olive or black color. Unlike most terrapins, the diamondback inhabits salt and brackish waters, living in the marshes which fringe our seacoast from Cape Cod to Texas. Formerly very abundant throughout this region, the constant extensive fishing to supply the markets has greatly reduced its numbers, so that the problem of its artificial propagation is now being taken up seriously. The principal fisheries are in Chesapeake Bay and on the coasts of New Jersey and North Carolina. Although a considerable number are dug from the mud while hibernating, a much larger proportion are captured by means of traps, seines, etc., during the summer months, and are confined in pens, where they are fed on oysters, fish, and celery to fatten them for the winter market. From the point of view of the epicure, the diamondback is perhaps the most famous and esteemed product of American waters, and during the season of greatest demand commands almost fabulous prices. Those commonly sold have a length of shell of from five to eight inches, and are supposed to be from 6 to 10 years old. The habits differ but little from those of other terrapins. They are omnivorous, lay their eggs in June and July in small nests excavated in some warm sandy bank, and hibernate during the winter after burying themselves a few inches beneath the mud. See TERRAPIN.

Diamond-beetle, the *Entimus imperialis*, a splendid coleopterous insect belonging to the family *Curculionidæ* or weevils. The ground color is black, but the insect is covered by a large number of scales which appear brilliantly green by reflected light. It is very abundant in some parts of South America.

Diamond-bird, an Australian bird (*Pardalotus affinis*), of beautiful plumage, receiving its English name from the peculiar markings of its feathers. Its general color is gray and white, but spotted with red, yellow, orange, and black. It makes its nest in old tree-trunks, and sometimes burrows in the ground, or utilizes any chance excavation. It feeds on insects.

Diamond Gauge, a gauge for estimating the size of diamonds. In the staff are set crystals of graduated size, by which jewels are compared. The crystals are from one quarter to one sixty-fourth of a carat.

Diamond Industry, a most important and far-reaching department of national and international commerce, which is spreading and increasing, year by year, especially in the United States. The diamond has been a precious stone procured with difficulty, treasured up with jealous care, and sought after by the rich and magnificent for ages. Diamonds are also indispensable for instruments employed in some of the manufacturing and industrial arts. A consideration of the diamond industry must include an account of the mining, polishing, importation, and sale of this gem. The distribution of diamonds in the geological formations of the world, their mining, etc., has been dwelt upon under the article DIAMOND (q.v.). It remains to point out some recent industrial facts of importance, with regard to the separation of diamonds from the concentrates, which remain when the diamantiferous earth has been washed, after being brought to the surface at Kimberley; their importation to this country, and their artificial manufacture. In mining diamonds, it was necessary until recently to go very carefully over the concentrates to pick out the garnets and many other foreign substances until nothing remained but the rough diamonds. This is a slow and laborious operation, but it has been an essential part of the mining industry until it was superseded by a discovery made a while ago. The discoverer was Mr. Fred Kersten, one of the employees in the sorting room. His discovery was accidental. A rough diamond and a garnet happened to be lying on a small board on the bench where he was working. He happened to pick up one end of the board when the garnet glided off, but the diamond remained. Kertsen found that there was a coating of grease on the board which had retained the diamond, while the garnet slipped off. He procured a wider board, coated one side of it with grease and dumped a few handfuls of concentrates on it. Then he found that by holding the board in a slightly inclined position and vibrating it, all the concentrates except the diamonds moved to the lower end and fell off while the diamonds remained in place. Then he invented a machine by which his discovery might be utilized. The invention was an entire success. All the garnets and other minerals that are not wanted pass over the surface of the table, while every diamond, large or small, is retained. The entire work is now done by machinery, and both the young inventor and the owners of the diamond mines are profiting by the new labor-saving device. The United States is a very large purchaser of diamonds. One third of the entire amount of cut stones is owned in this country. The importations are increasing.

More than $30,000,000 worth of diamonds and other precious stones were brought into the United States last year according to the statistics of the Department of Commerce and Labor. This is the largest importation of diamonds and other precious stones ever shown in a single year of United States commerce. Prior to 1887

the total had seldom, if ever, reached $10,000,000 per annum; from 1887 to 1893 the total gradually moved upward until it reached $10,000,000; then it rapidly fell to $5,500,000 in 1894, $7,500,000 in 1895, $6,750,000 in 1896, and $2,500,000 in the fiscal year 1897. In 1898 the total increased to nearly $9,000,000, in 1899 to over $14,000,000, in 1901 to $20,000,000, in 1902 to $23,000,000, and in 1903 will be fully $30,000,000, making the total for the year just ended not only more than in any preceding year, but 50 per cent in excess of 1901, double the figures of 1899, and more than six times the average during the period 1894–7.

This rapid growth in the importation of diamonds, while it suggests general prosperity, also seems to indicate the development of a comparatively new industry in the United States — the cutting of diamonds. The total importations of diamonds alone in the 11 months ended with May amounted to $24,000,000, and of other precious stones $4,500,000. Of the $24,000,000 worth of diamonds imported, $10,000,000 were uncut diamonds; this total of $10,000,000 of uncut diamonds is a large increase compared with the importations of uncut diamonds in preceding years, the figures for 11 months of the year 1902 being $5,500,000, while for the corresponding period of 1901 they were $6,500,000, for the corresponding months of 1900 $3,500,000, and for the corresponding months of 1898 but little over $2,000,000.

The diamonds imported are divided by the bureau of statistics statements into two groups, namely: "Diamonds uncut, including miners', glaziers', and engravers', not set," and "Diamonds cut, but not set." The value of diamonds uncut, including miners', glaziers', etc., imported in 11 months ended with May has grown from $2,500,000 in 1898 to $10,000,000 in 1903, while that of diamonds cut but not set has grown from $4,000,000 in 1898 to $14,000,000 in 1903, these figures being in each case for the period of 11 months. This inference that the cutting of diamonds is becoming an important industry in the United States is strengthened by the fact that the census statistics of "lapidary work" show that the total value of production of lapidary work in 1900 was over $5,500,000, against less than $500,000 in 1890, and that the value of the materials used in this work in 1900 was over $4,500,000, against less than $250,000 in 1890.

It is indeed worthy of note that although the largest percentage of diamonds is cut outside of the United States, and all of them mined in other countries, the most improved machinery and many of the patented devices for mining and cutting have been the products of American ingenuity. Even Gardner F. Williams is an American born and bred.

Although the annual production of diamonds has increased more than 1,500 per cent in the last 30 years, and though there are produced at the present time more than 3,000,000 carats annually, as against 200,000 before the discovery in South Africa, the changed condition has come about in such a manner that the stone has not been cheapened in value, has been fixed on a more even market basis, and has that much enriched the world.

The cutting branch of the industry has almost doubled in the past eight years, and now keeps employed between 700 and 800 men. Nearly five sevenths of the diamond cutting of the world is done in Amsterdam and Antwerp, though New York has recently begun to make its influence felt in that direction. There are about 9 or 10 cutting establishments in New York and Brooklyn, employing from 40 to 80 men each, and although the wages paid to American workmen are much higher than those paid in Europe, the advantage of better machinery in this country averages the cost of cutting. This is especially true in regard to large stones, though not always so with respect to stones running below an eighth of a carat.

Details of the artificial manufacture of diamonds in an electric furnace by Prof. Henri Moissan, at the University of Paris, were published in June 1903. His experiments were begun after his finding of microscopic diamonds in nature, in the "blue earth" from the Cape, in the sands of Brazil, and in several meteorites. His researches showed that if carbon was produced at low temperatures it was always obtained in the amorphous condition and no crystals were found. The details of the manufacture are thus described:

"For his experiment, Prof. Moissan utilized the pressure which is produced in iron when it passes from the liquid to the solid state. It is known in fact that solid iron is less dense than when in fusion, as is shown by the fact that pieces of the metal will float on the melted bath, and it thus resembles water in this respect. He melts the iron in the electric furnace and saturates it with carbon, and to carry this out 200 grammes of Swedish iron cut into cylinders half an inch long and two fifths inch diameter were placed in a carbon crucible and completely covered with powdered charcoal. The crucible was placed under the arc and heated during 3 to 6 minutes with a current of 350 amperes at 600 volts. The cover of the furnace was removed and the crucible seized with a pair of tongs and plunged quickly into a bath of cold water. The crucible and metal remain red for a few moments, giving off gases which come to the top, then the whole cools off. It was not without apprehension that the experiment was made for the first time, as it was feared that an explosion would be produced when the melted mass at 3,000 degrees came in contact with the cold water. But no bad effect is produced by the meeting of the hot mass and the liquid; and during the first period the mass is cooled rather by a rapid radiation. In order to cool it by conduction, and thus more quickly, it was placed in iron filings. In this way the diamonds which were obtained were of a peculiar nature, and they contained specks of black carbon. The pressure seems to be less, and the transformation of the carbon into the diamond is less complete. The experiment is, however, highly instructive, as it gives a form of speckled diamond which is also found in nature. To obtain a more rapid cooling, a bath of melted lead was found the best; it was kept at about the fusing point, or 617° F. The crucible, heated as before, is quickly plunged into the bath of melted lead, which is about 6 inches deep. The iron, which is lighter than the melted lead, is detached from the crucible in masses which tend to form spheres and rise more or less rapidly to the top. When the iron is saturated with carbon in the furnace, it becomes so pasty that the crucible can be turned over and it will not run out, but when it cools off the metal soon becomes liquid and gives up graphite.

"The smallest spheres, half an inch in diameter, were solid and sufficiently cool on coming to the top. These spheres gave a good yield of diamonds and the latter were especially clear and brilliant, and the spotted form was absent. Some of the crystalline forms were very sharp. One of the transparent diamonds measured as high as 0.57 millimetre, and had a somewhat triangular form with the angles rounded off. It was perfectly clear. It is curious to note that three months after its formation it split into two pieces; this fact is significant, as some diamonds from the Cape show an identical action, this being no doubt due to irregularities of pressure at the time of formation. The samples of diamonds obtained by this method were interesting to examine as to their different form. Most of them were smooth and brilliant, while others had a grained surface. All the specimens had the particular lustre which is characteristic of the native diamond. When a ray of light is sent into the interior they appear to become luminous. Some of the specimens are cubes and octahedra, with rounded angles."

Diamond Jousts, jousts instituted by King Arthur, "who (according to the Arthuric legend as set forth by Tennyson) by that name had named them since a diamond was the prize." Before he was king he came by accident to a glen in Lyonnesse, where two brothers had met in combat. Each was slain; but one had worn a crown of diamonds which Arthur picked up, and when he became king offered the nine diamonds as the prizes at nine several jousts, "one every year, a joust for one." Lancelot had won eight and intended to present them all to the queen, "when all were won." When the knight at last laid them all at her feet, Guinevere, in a jealous rage, flung them out of the palace window into the river.

Diamond Necklace, a jewel the incidents connected with which have furnished materials for one of the best historical romances of Dumas. This necklace contained 500 diamonds, was valued at some $400,000, and was made by order of Louis XV. for his mistress, Madame Du Barry. The necklace was not finished in the king's lifetime, and after his death the Du Barry was banished. Between the years 1783 and 1784 the charms of Queen Marie Antoinette had infatuated the Prince-Cardinal Rohan, who was led to believe, by the so-called Countess Jeanne de Lamotte-Valois, an unprincipled adventuress, that the queen reciprocated his feelings. The cardinal was informed that the queen was anxious to purchase the diamond necklace and wished for him to become surety for the price to the makers, MM. Boehmer and Bassauger. The cardinal agreed to become security, the necklace was delivered, but never reached the queen. Jeanne de Lamotte and her husband, meanwhile, had disappeared from Paris, and were selling the diamonds in parcels. The plot was discovered when the jewelers went to court complaining that the necklace had not been paid for. The cardinal and others concerned were thrown into prison. As the trial established rather the folly than guilt of any one excepting the Countess Lamotte, she and her husband were branded on the shoulders as thieves, and sentenced to a life imprisonment. The resultant scandal greatly aggravated that popular rage which terminated in the French Revolution.

Diamond-snake, an Australian serpent (*Python spilotes*). This is a richly colored snake belonging to the true pythons. It inhabits every portion of Australia, particularly Victoria, where the rocks and watered woods afford protection. It is a nuisance to farmers, as it robs the poultry-yards. It is not venomous, but can inflict a painful bite. The markings on the scales give it its name.

Diamond State. See DELAWARE.

Diamond Wedding, the celebration of the 75th anniversary of a wedding, at which presents of diamonds are given. Other anniversary weddings sometimes celebrated are paper, wooden, tin, crystal, and china weddings, namely, on the 1st, 5th, 10th, 15th, and 20th anniversaries; while silver and golden weddings are celebrated on the 25th and 50th, respectively, presents being made to the bride of the material indicated in the title.

Diana, Italian goddess, whom the Romans subsequently identified with the Greek Artemis. Diana was the protectress of slaves, who held a yearly festival in her honor. She seems to have been originally the patron divinity of the Sabines and Latins. She was a virgin, and no man was allowed to enter her temple.

The Greek Diana or Artemis was the daughter of Zeus (Jupiter) and Leto or Latona, and was the twin sister of Apollo, born in the island of Delos. While yet a child she entreated her father to suffer her to continue a virgin. She desired him, at the same time, to give her a bow and arrows, a city, and rule over the hills, 60 Oceanides, and 20 river nymphs, and to permit her to bear a torch and hunt in the forests. Zeus caused 30 cities to be devoted exclusively to her worship, and appointed many others where she was venerated in common with other deities. As Apollo directs the chariot of the sun, Artemis guides that of the moon. Eros and Aphrodite sought to conquer her in vain. Hunting, music, and dancing alone had charms for her. She punished without mercy those of her virgins who violated their vows of chastity. Actæon, grandson of Cadmus, who secretly watched her as she was bathing, she changed into a stag, and his own dogs tore him in pieces. The beautiful Endymion, however, at length made her feel the power of love. While enlightening the earth as Selene (the moon), she beheld the hunter, fatigued with the chase, slumbering in the woods. She descended from her ethereal course, and kissed the lips of the youth, who enjoyed a favor never before granted to mortal or immortal. Notwithstanding her aversion to love, she afforded aid to women who called upon her in travail. She was also the goddess of death. She aimed her darts especially at the female sex, and brought the old, who were satiated with life, to a gentle death, to make way for the vigorous and blooming. When angry she destroyed with pestilence and disease, like her brother Apollo. When offended she revenged without compassion. Thus she slew Orion, the hunter, from jealousy, because Eos (Aurora) had fallen in love with him; so also the daughters of Niobe, because their mother preferred herself above Latona, etc. In the Trojan war both Artemis and Apollo aided the Trojans; and in the war with the giants and Titans she proved her valor.

The worship of Artemis was spread through

all Greece, and the various legends here related do not all refer to the same deity, it being common in ancient mythology to group together under the name of some celebrated divinity the local associations and traditions originally belonging to different mythical personages. She received many surnames, particularly from the places where her worship was established, and from the functions over which she presided. She was called Lucina, Ilithyia, or Juno Pronuba, when invoked by women in child-bed, and Trivia when worshipped in the cross-ways, where her statues were generally erected. She was supposed to be the same as the moon and Proserpine or Hecate, and from that circumstance she was called Triformis; and some of her statues represented her with three heads, that of a horse, a dog, and a boar. She was also called Agrotera, Orthia, Taurica, Delia, Cynthia, Aricia, etc. She was supposed to be the same as the Isis of the Egyptians, whose worship was introduced into Greece with that of Osiris, under the name of Apollo. The Artemisia was a festival celebrated in honor of her at Delphi. At first she was represented with a diadem, afterward with the crescent upon her head, with bow and arrows, a quiver over her shoulders, and a light hunting dress, together with her hounds. Her most famous temple was at Ephesus, and was considered one of the wonders of the world. She was worshipped there as the symbol of fruitful nature, and represented with many breasts, encircled with numerous bands.

Diana of France, Duchess of Montmorency and Angoulême, French intrigante: b. Piedmont 1538; d. 3 Jan. 1619. She was a natural daughter of Henry II.; was formally legitimized, and married first to a son of the Duke of Parma, next to the eldest son of the Constable de Montmorency. She enjoyed great influence at court under Henry IV., superintended the education of the young prince, afterward Louis XIII., and then retired from court.

Diana of Poitiers, pwä-tē-ā, Comtesse de Brézé, Duchess de Valentinois, French beauty: b. 1499; d. 1566. She was the mistress of King Henry II. of France, in whose name she ruled with unlimited power. Till his death in 1559 she exercised such an absolute empire over the king by the charms of her wit and grace, that her superstitious contemporaries ascribed her power to magic. Upon his death she retired to her castle Anet, where she established a charitable institution for the support of 12 widows. Medals are still to be seen bearing her image, trampling under foot the god of love, with the inscription, *Omnium victorem vici* (I have conquered the universal conqueror).

Diana Monkey, a monkey (*Cercopithecus diana*), native to the west coast of Africa. Its name is given because it bears on its forehead a crescent of upright white hairs, suggestive of the new moon, which was the emblem of the Greek goddess Diana. It is black in color, streaked with brown down the back; the fore parts are pure white, as also is the long beard. It is gentle and easily tamed, but is not strong enough to endure captivity and change of climate. Hence the specimens sent to menageries usually die within a short time.

Diana's Tree (*Arbor Dianæ*), silver tree, is formed from a solution of silver in nitric acid, precipitated by quicksilver, and crystallized in prismatic needles which are grouped together in the form of a tree. To make this beautiful process visible, let a quantity of pure silver be dissolved in nitric acid; then dilute the saturated solution with 20 or 30 parts of water, and put in an amalgam of eight parts mercury and one part silver leaf, upon which after some days crystals are formed. The crystals consist of an amalgam of silver, or rather a definite compound of the silver and mercury. The name is formed from the supposed connection between the moon and the metal silver.

Dian'thus, a genus of the pink family (*Caryophyllaceæ*). The genus has about 200 species, natives of the Old World. The name is said to be from the Greek, and to signify "Jove's flower." The American species are all naturalized from Europe, and are fugitives from cultivation. The best known are maiden pink (*D. deltoides*), which in summer is found in the region from eastern Massachusetts to Michigan, and the bunch-pink or sweet-william (*D. barbatus*), found wild occasionally in the Eastern and Middle States.

Diapason, dī-a-pā'zŏn or -sŏn (meaning in Greek, complete, all-pervading), a term in music by which the ancient Greeks designated the octave. The French use the term as equivalent to pitch. Diapason is also the English name given to certain fundamental stops of the organ.

Diapedesis, dī-a-pe-dē'sis, a process in which red and white blood cells pass through the walls of the capillary blood vessels. It is a constant accompaniment of inflammation, and is to be regarded as a protective mechanism on the part of the body, particularly of the white blood cells.

Diaper, a kind of textile fabric much used for towels and napkins, and formed either of linen or cotton, or a mixture of the two, upon the surface of which a figured pattern is produced by a peculiar mode of twilling. In the fine arts the term is used for a kind of surface decoration consisting of the repetition of a simple unit or units of design evenly spaced.

Diaper Ornament, in architecture, an ornamentation of flowers, applied to a plain surface, either carved or painted. If carved, the flowers are entirely sunk into the work below the general surface. They are usually square, and placed close to each other, and are various in their pattern and design. Diaper work was first introduced in the early English style in some of the principal Gothic structures in England.

Diaphoret'ics, or **Sudorifics,** agencies that increase the secretion of sweat. The chief diaphoretics are heat — in the form of hot packs, warm drinks, etc. — alcohol, pilocarpine, opium, salicylates, and a number of the newer synthetic products, such as antipyrine, phenacetine, antifebrine, etc. Diaphoretics are employed largely to reduce temperature, as they increase the perspiration and thus permit of a large amount of surface evaporation. They are also useful agents often in the treatment of disease of the skin, since they cause an increased amount of blood to flow to the skin and thus improve its nutrition.

Diaphragm, dī'a-frăm. 1. In anatomy, a large robust, muscular membrane or skin placed transversely in the trunk, and dividing

the chest from the belly. In its natural situation the diaphragm is convex on the upper side toward the breast, and concave on its lower side toward the belly; therefore, when its fibres swell and contract, it must become plain on each side; and consequently the cavity of the breast is enlarged to give liberty to the lungs to receive air in inspiration; and the stomach and intestines are pressed for the distribution of their contents; hence the use of this muscle is very considerable. It is the principal agent in respiration, particularly in inspiration; for when it is in action the cavity of the chest is enlarged, particularly at the sides, where the lungs are chiefly situated; and as the lungs must always be contiguous to the inside of the chest and upper side of the diaphragm, the air rushes into them in order to fill up the increased space. In expiration it is relaxed and pushed up by the pressure of the abdominal muscles upon the viscera of the abdomen; and at the same time that they press it upward they pull down the ribs, by which the cavity of the chest is diminished and the air suddenly pushed out of the lungs.

There are three openings in the diaphragm, one for the passage of the inferior vena cava; one for the passage of the œsophagus and pneumogastric nerves; and the aortic, through which pass the aorta, the right vena azygos, and thoracic duct. The diaphragm also comes into play in hiccough and sobbing, laughing and crying, sometimes causing hernia, or rupture of the viscera.

2. In optics, an annular disk in a camera or telescope or other optical instrument, to exclude some of the marginal rays of a beam of light. The original form of this beautiful contrivance is the iris of the eye, which shuts out strong light and regulates the quantity admitted.

Diarbekir, dē-är″bĕ-kēr′, Asiatic Turkey, city, capital of the vilayet of Diarbekir. It stands on a high bank overlooking the Tigris, and is surrounded by a lofty massive wall, built of blocks of black porous stone, the best houses being also of the same material. The principal edifices are the great mosque, a fine structure with a square tower, and originally a Christian church: and the Armenian cathedral and Chaldæan church, handsome buildings recently erected. The manufactures, once very extensive but now greatly decayed, consist chiefly of iron and copper ware, leather, silk, woolen, and cotton goods; the bazaars are well stocked with every description of goods, and a limited trade is carried on with Syria and Aleppo. Pop. about 40,000.

Diarrhœa, a symptom of a disordered condition of the intestines, accompanied by too frequent movements of the bowels, due to their increased peristaltic (or wave-like) motion. Like dyspepsia, it is only a symptom of some pathological condition. Diarrhœa is usually the result of some indiscretion in diet, such as the eating of unripe or overripe fruit, improper or indigestible foodstuffs; or of poorly cooked, decomposed, or tainted meats and fish, these inducing a kind of diarrhœa due to a toxic or poisonous bacteria known as ptomaines, and is frequently alluded to as ptomaine poisoning. While relatively more prevalent in the city than in country districts, and oftener found among the poor than the well-to-do, it cannot be said that diarrhœa is particularly a disease of the city or of the poor, since severe and even fatal attacks of it frequently occur among the rich inhabiting the seaside or mountains.

The conditions that produce diarrhœa are varied and numerous. Exposure and sudden chilling of an overheated body, particularly of the abdomen, are potent causes; and travelers who make frequent changes of drinking water are very susceptible to it. In these cases personal idiosyncrasy plays an important role. The drinking of impure water and living in poor hygienic surroundings cause diarrhœa. Whether sewer gas or pollution of the atmosphere has direct influence is a disputed point, but it is certain that direct drainage of polluted sewage from districts infected with epidemic diarrhœa into a water supply is a potent cause.

Daily variations of temperature, such as are experienced in the hot season from May to September, are familiar predisposing factors. Environment such as is found in densely populated districts where people live in damp basements, etc., with vitiated atmosphere and want of care, is in the same category of causes.

Diarrhœa is often caused by the irritating action of mineral poisons, such as mercury, arsenic, and antimony, by overdoses of croton oil, etc., or by various cathartic nostrums. Worms of various species are likewise causative factors. Of late much attention has been given to these parasitic causes, notably that of protozoön *Amœba coli,* so frequently found in the stool of diarrhœics, principally in tropical cases. Secondary diarrhœa is a phenomenon found during an attack of some antedating disease, as ulcer of the bowel, cancerous growths of the intestines, and the inflamed and ulcerative stage of typhoid fever. In diabetes and Bright's disease it is mostly a form of eliminative diarrhœa. Nervousness, particularly in women, is an annoying cause due to a temporary local congestion of the mucous membrane of the intestine.

The symptoms of diarrhœa naturally vary with the causes, though certain symptoms are common to all forms. One of these is the frequency and character of the stools, which may vary from 5 to 20 or more in a day. At first soft, and mixed with particles of undigested food, they gradually grow more liquid until almost watery, and are attended by griping colic-like pains about the navel. Flatulence and vomiting are also prominent features, and thirst is often great, owing to loss of liquids from the body through repeated evacuations. The pulse is usually quickened, though the fever is seldom high, and is of no serious consequence. If the diarrhœa become chronic or long continued, prostration ensues, though this contingency is infrequent. Secondary diarrhœa, due to chronic congestion or pathological changes in the intestines, is much more intractable.

The treatment of diarrhœa must necessarily vary with the inciting cause, though many cases recover spontaneously or need treatment for only a few days. Absolute rest and low diet are indicated in all forms. If the attack is due to exposure or cold, the application of hot turpentine stupes to the abdomen, with the administration of small and frequent doses of opium and bismuth, may be all that is required, when, however, it is due to offending food in the intes-

tines, or to ptomaines, the prompt removal of these elements must be effected. Broken doses (one tenth gr.) of calomel every half hour, or a teaspoonful dose of Epsom salts in Vichy water, until the stools assume a more natural consistency, are prompt and efficient remedies. By far the most popular is a prepared dose of castor oil containing 10 or 15 drops of laudanum. This should be followed by astringent antiseptics, combined with opium and a digestive; for instance, sulph-carbolate of zinc or soda, opium in either powdered or extract form, with blue-mass. Should the pain be excessive, chlorodyne, or hyoscyamine, or in extreme cases small doses of morphia may be given until the patient is relieved. For the vomiting, small doses of hot water, or plain lime water will be effective, and the application of the old-time spice-plaster or hot poultice will be found soothing. Some prefer the ice-bag. Should there be any oppression, aromatic spirits of ammonia, or stimulants like brandy or whiskey, well diluted, will restore the strength, though this is seldom necessary.

The undue haste to stop diarrhœa suddenly, and the eagerness which patients exhibit to take large doses of paregoric or laudanum, or nostrums called cholera drops or diarrhœa mixtures, in all cases is mentioned only to be condemned. A more rational course is to remove the cause, thereby assisting nature to regain her normal tone and re-assert her disturbed functions.

In children and infants the same general rules should be followed, with modifications to suit each individual. In place of milk, substitute a milder form of nourishment such as egg, barley, or rice water. (See CHOLERA INFANTUM.) Another and more direct form of treatment than giving remedies by the mouth is the use of enemas, or both can be employed in conjunction. High rectal enemas are used of astringent antiseptics held in suspension in thin starch solutions, or with turpentine added.

The constipation which usually occurs after recovery from diarrhœa had better be disregarded for a day or two, when mild cathartics or laxative remedies can be used. Very effective remedies are glycerine suppositories and enemas of cold water.

WILLIAM RUOFF, M.D.,
Philadelphia.

Diary, a daily record of events or observations made by an individual. It contains a narrative, more or less detailed, of matters of personal interest, often including the results of reading or meditation. Yet references to current events of general interest are sometimes introduced. This form of diary is also known as a journal. To the mercantile man a diary serves the purpose of an order or memorandum book; while the physician finds it indispensable as a register of engagements. Books convenient for making such records are issued every year, containing besides the blank pages, various reference tables, etc. The "Ephemeris" of the ancients was originally a military record or journal, a day-book or account-book, also a collection of tables showing the position of the heavenly bodies, but passed into literature to mean a collection of records of what has happened on the same day in various years, or a mere general name for any form of periodical books or magazines.

Diaries have often furnished the historian with invaluable material, supplying the absence of public records, and furnishing minute and intimate details of manners and of motives that do far more to help us to understand the past than more formal records. Such documents as Robert Baillie's 'Journals,' the 'Diaries' of Pepys and Evelyn, and the 'Journals' of Greville are among the most valuable sources of real history.

Dias, Antonio Gonçalvez, ān-tō'nē-ō gōn-săl'vĕth dē'as, Brazilian poet: b. Caxias to Aug. 1823; d. 3 Nov. 1864. He was educated in Portugal, and returning to his native country, published at Rio de Janeiro in 1846 a volume of poems entitled 'Primeiros cantos,' which was followed by his drama of 'Leonor de Mendonça' (1847); 'Segundos cantos' (1848); and 'Ultimos cantos' (1850). In 1848 he was chosen professor of national history in the college of Dom Pedro II.; he was subsequently employed in the office of the minister of foreign affairs, and in 1855 was charged with a scientific mission to Europe. His poetry has been exceedingly popular in Brazil.

Dias, Bartholomeu, bär-tō-lŏm-mā'oo, Portuguese navigator: b. about 1445; d. 29 May 1500, while on his way from Brazil to India. In 1486 he sailed on an expedition to explore the west coast of Africa, and without knowing it was carried around the southern point of the continent and landed at the mouth of Great Fish River, where he discovered that he was on the east coast. The stormy cape he called Cabo Tormentoso, a name which the king of Portugal changed into Cape of Good Hope. Dias subsequently sailed on another African expedition under Vasco da Gama, and commanded one of the vessels in the fleet with which Cabral discovered Brazil. It was on this expedition that he perished.

Dias, Henrique, ān-rēk', Brazilian general: b. Pernambuco about 1600; d. latter part of the 17th century. He was a freed negro, who by his superior attainments rose in 1639 to the supreme command of the colored soldiery of the Brazilian army. He took a conspicuous part in the protracted warfare which finally led to the overthrow of Dutch influence.

Diaspore (Gr. "scattering"), a native hydrated oxide of aluminum, having the formula $Al_2O_3.H_2O$, and crystallizing in the orthorhombic system. It is commonly gray, creamy-white, or lilac in color, though sometimes various shades of brown and yellow, or colorless. It has a hardness of from 6.5 to 7, and a specific gravity of about 3.4. It is transparent to subtranslucent, and exhibits powerful doubly refracting properties. The best known localities in which it occurs are Chester, Mass., Newlin, Pa., in the United States, and in Europe near Schemnitz, Hungary. Many specimens decrepitate strongly when heated before the blowpipe, separating into pearly scales that are scattered in all directions; and it is from this peculiarity that the mineral derives its name.

Diastase, dī'a-stās, a substance existing in barley, oats, and other plants, and also in animals. When in solution it possesses the property of causing fecula or starch to break up at the temperature of 156° F., transforming it first

into dextrine and then into sugar. It is obtained by digesting in a mixture of three parts of water and one of alcohol, at a temperature of 113° F., a certain quantity of germinated barley ground and dried in the open air, and then putting the whole under pressure and filtering it. It is solid, white, and soluble in water and diluted alcohol, but insoluble in strong alcohol. If 200 parts of fecula be mixed with 1,000 parts of water, and a portion of diastase be added, and the mixture kept at a temperature of about 156° F., the starch is converted gradually into dextrin and grape-sugar. The action of diastase is prevented by acids, alkalies, and some salts, but not by alcohol or ether. A solution of diastase becomes acid, and loses its power on starch. The action of the diastase of germinating barley is important in brewing. The composition of diastase has not been exactly determined. It is, however, an albuminoid substance. A body having the power of converting starch into sugar exists in saliva and is known as ptyalin. It is also an albuminoid, and is probably analogous to diastase in its composition. Diastase is used in the manufacture of dextrin (q.v.), and it has also been proposed for dissolving the starch and dextrin used by printers for thickening their colors.

Diastole, dī-ăs'tō-lē. In the description of circulation of the blood it was shown that Harvey first appreciated that there was a successive contraction and dilatation of the heart-muscle. The term systole has been applied to this contracted state and the term diastole to the succeeding dilatation.

Diather'mancy, a term designating the property that is possessed in various degrees by different substances of transmitting radiant heat. Bodies that are equally transparent, that is, bodies which have equal power of transmitting rays of light, are very different in their power of transmitting heat rays. Thus a thin plate of glass and a thin plate of rock salt may be nearly equally transparent, but the plate of rock salt has far superior power of transmitting rays of heat. This may be shown very simply. Let a delicate thermometer be placed near to a lamp (but not above it), the mercury will rise on account of the heat radiated to it. If a plate of rock-salt be interposed between the lamp and thermometer, the mercury will fall slightly; but if a plate of glass of equal thickness with the plate of rock-salt be interposed, it will be seen that the greater part of the heat is at once cut off from the thermometer. The transparency of bodies to light does not at all necessitate their diathermancy. Thus clear rock-crystal, which is transparent, and smoky rock-crystal, which is opaque, are nearly equally diathermanous; and solution of iodine in bisulphide of carbon, which is perfectly opaque to light, is highly diathermanous. The diathermancy of plates of various thickness has also been determined. The diathermancy decreases very rapidly as the thickness increases. Consult: Stewart, 'Treatise on Heat'; Deschanel, 'Elementary Treatise on Natural Philosophy.' See also RADIATION; THERMO-ELECTRICITY.

Diathesis, dī-ăth'ē sĭs. There is in all organic life a certain predisposition for the constituents of the cells to behave in a certain predetermined manner, and in medicine this term comes to mean the predisposition or constitution of a body by virtue of which certain of its tissues or organs become at one time or another the seat of affections similar in their nature. Thus there exists in certain families a tendency to the development of certain constitutional diseases, such as gout, rheumatism, tuberculosis, etc. In others there may be a predisposition to nervous instability. In others there are conditions which bring about ready disturbance of the digestive powers. In most of these instances there seems to be a point when the store of vitality in the tissues of an organ becomes exhausted earlier than in other predisposed individuals, so that diathesis may be described in other words as a premature localized breakdown.

Diatomaceæ. See DIATOMS.

Diatoms, dī'a-tŏmz, a sub-order of microscopic plants belonging to the class *Algæ*. A plant of this sub-order consists of a unilocular or a septate cell; and its cells are composed of two symmetrical valves, multiplying by spontaneous separation. There are two well-defined sections: (1) *Diatomeæ,* including species invested with a silicious epidermal covering, occurring both in fresh and salt water, often exhibiting exquisite sculpturings when seen under the microscope, and testing the highest powers of the instrument; (2) *Desmidieæ,* minute fresh-water plants of a green color, without a silicious covering. There are more than 4,000 distinct species scattered over all parts of the world. The walls of the cells are rendered hard by silica and they are reproduced by fission, the splitting taking place parallel to the longer axis. When the protoplasm escapes the cell walls retain their shapes and delicate markings. Enormous quantities of them are found as fossils in the beds of the Tertiary formation. Often the protoplasm of two diatoms will escape and unite to form a zygospore, which after a time will divide into two, each forming a new cell larger than before. Some diatoms are free and move rapidly through the water; others secrete a mucilaginous substance whereby they attach themselves to various objects. In some cases the diatoms, after splitting, remain attached to one another, forming bands or ribbons. They are classified, according to the structure of the cell walls, three main families being recognized, according as they have on the principal face of the wall a distinct ridge (*Raphidieæ*), an indistinct or false ridge (*Pseudoraphidieæ*), or no ridge at all (*Araphidieæ* or *Cryptoraphidieæ*).

The diatoms possessing a silicious epidermis have been eagerly studied of late years by microscopical observers, who have greatly increased the number of genera and species. They are universally distributed, and their silicious coverings being indestructible, their remains are accumulated and perpetuated in many localities, sometimes forming extensive deposits, as of Richmond, Va., which is said to be built upon a stratum of these microscopically minute atoms 18 feet in thickness. Species of *Arachnoidiscus* and other genera of great beauty are obtained from guano. The bergmehl or mountain-meal of Sweden consists of diatoms. The mud at the mouths of many rivers, the sediment of ponds, ditches, and even rain-troughs, contain myriads of the same minute organisms. They were found by the Arctic navigators investing the

fields of polar ice; and they have also been detected in the dust evolved from volcanoes.

Diatonic, a term used in the science of music, originally from the Greek, meaning "through the tones." The diatonic mode of the ancient Greeks — as distinguished from their chromatic and enharmonic mode — formed the foundation of their whole system of music, and was arranged in three tetra chords composed of one semitone and two whole notes. In modern music the term is applied to compositions which follow the tones, intervals, or harmonies of the standard major or minor scales, without chromatic alteration.

Diatribe, dī'ą-trīb (Greek, *diatribé*), a dwelling or lingering upon, originally signified a sustained discourse or disputation, afterward came to be applied to a violent and sweeping criticism, whether written or spoken.

Diaz, dī'āz, **Abby Morton**, American writer: b. Plymouth, Mass., 1821; d. Belmont, Mass., 1 April 1904. She was a member of the famous Brook Farm Association, and has been an earnest worker in social reforms. She founded the Woman's Educational and Industrial Union of Boston, and was its president for many years. Her books for children include: 'The Cat's Arabian Nights' (1881); 'The John Spicer Lectures' (1887); 'Polly Cologne'; 'Jimmyjohns'; and 'The William Henry Letters' (1870). Other works are: 'Bybury to Beacon Street, a Discussion of Social Topics'; 'Domestic Problems'; 'Only a Flock of Women' (1893).

Diaz, Miguel, mē-gĕl' dē äth, Spanish explorer: b. Aragon second half of the 15th century; d. 1514. He took part in the second voyage of Columbus, and was one of the colonists of the island of St. Domingo. He quitted the colony in 1495 in consequence of a duel, and took refuge with a few of his companions in the southern part of the island, where he married a native. Through the advice of his wife he discovered the gold mines in this part of the island, the existence of which he communicated to Bartolomé Columbus, whereby he reconciled himself with the colonists, and led the way to the foundation of the town of Nueva Isabella, afterward called St. Domingo. He was made governor of Porto Rico in 1509, but his fidelity to the family of Columbus repeatedly brought him into trouble.

Diaz, Porfirio, pōr-fē'rē-ō dē'äs or dē'äth, Mexican statesman: b. Oaxaca 15 Sept. 1830. He received a classical education at the Oaxaca Institute, and had begun studying law when the war with the United States broke out. He served through that struggle in the National Guard, and on the conclusion of peace made a study of military science. On Santa Anna's accession to the dictatorship, he left the army and practised law; but returned and bore a conspicuous part in the revolution of 1854; took the field to oppose the French troops and was taken prisoner, but made his escape; harassed Maximilian's troops till forced to surrender a second time at Oaxaca in 1865; besieged and captured Puebla in 1867, and immediately marched on Mexico City, which surrendered to him 21 June. On the re-establishment of the republic he was an unsuccessful candidate for president. In 1872 and 1876 he led revolutions against the government, and after three severe battles occupied the capital in the latter year. In 1877 he was elected president to fill the unexpired term of the fugitive president, Lerdo. According to the "plan of Tuxtepec," which he had proclaimed, he was ineligible to succeed himself. His secretary, Gen. Gonzales, was elected president, and Gen. Diaz was appointed chief-justice of the supreme court, and elected governor of Oaxaca. In 1884 he was re-elected president; in 1886 his partisans secured the abolition of the law prohibiting a second consecutive presidential term, and he has been thereafter continuously re-elected, his sixth term expiring 30 Nov. 1904. To Diaz Mexico is indebted for her rise, progress and standing as a nation. He has made property secure by preserving a stable government, and deserves the confidence of his people.

Diaz, Ruy, roo'ē dē'ath, Spanish soldier: b. Seville, Spain, 1503; d. Peru 1538. He went to Peru in 1532 with the expedition of Diego de Almagro, and took part in the conquest of Cuzco; then joined Velalcazar in the conquest of the province of Quito. He was sent by Pizarro to explore the valley of the Rimac, and it was in accordance with his report that the site was chosen for the city of Los Reyes (now Lima), and the city founded. When war broke out between Almagro and Pizarro, Diaz sustained Almagro, was in the battle of Abancay 1537, and other important engagements, and was captured at the battle of Salinas 1538, and put to death.

Diaz del Castillo, Bernardo (vulgarly **Bernal**), one of the Spanish conquerors of Mexico, and historian of that conquest: b. Medina del Campo, in Old Castile, about 1498; d. Santiago de los Caballeros, Guatemala, leaving numerous descendants. His work, entitled 'Historia Verdadera de la Conquista de la Nueva España,' is of uncommon value and interest. Date of his death not known. Probably his family belonged to the minor nobility: he says, when speaking of the conquerors, "We were for the most part hidalgos, although some were not of such clear lineage as others"; but he lacked the influence necessary to secure his appointment as an officer. He speaks of himself as "having been in this country (Central America and Mexico) twice before the coming of Cortés, and the third time with him." On the first occasion he accompanied Pedrarias Davila (q.v.); on the second, he took part in the expeditions to Yucatan and along the coast of Mexico under Córdoba and Grijalva (1517–18). Between 1515 and 1517 he visited Cuba; from Santiago de Cuba, on 18 Nov. 1518, he sailed with the Spanish fleet under Cortés; during the next few years he fought, it is said, in more than 100 of the battles with the Indians preceding or following the capture of the City of Mexico; and in 1523–4 he served under Pedro de Alvarado, conqueror of Guatemala and Salvador. Alvarado established the seat of government in the native (Guatemalan) town of Almolonga, afterward called Santiago de los Caballeros; and Bernal Diaz was made governor of this town, as a reward for his service in the field. He writes naïvely: "I was held in no inconsiderable degree of estimation in my day as a soldier"; and again, "I was twice in the hands of the enemy who were carrying me off to sacrifice, but God gave me strength to

escape out of their clutches." In 1550 he was summoned to an important council at Valladolid, "as being the most ancient of the conquerors of New Spain." His history was finished 26 Feb. 1568. Two licentiates who examined the work at that time, "observed that in regard to my style or language it was conformable to that in ordinary use in Old Castile, and that as such it was the more agreeable, not being embarrassed with flowering, affected phrases." The particular merit of the history is that it gives to each of the officers and soldiers the credit which was his due, instead of ascribing the overthrow of the Aztec empire and the establishment of New Spain solely to the genius of Cortés. "The historians Gomara and Illescas," Diaz writes, "never chose to relate our heroic actions, leaving all our value and honors in the dark, where they would have remained were it not for this my true history, and assigning such great merit to Cortés. Although they were right to a certain degree (in praising our leader), yet they should not have forgotten us." So desirous is he to make known the exact truth, that at the end of his manuscript he writes, "I beg the printers (señores impresores) for mercy's sake not to omit anything from or add anything to the foregoing."

MARRION WILCOX.

Diaz de Escobar, Narciso, när-thē'sō dē ăth dā ĕs'kō-bär, Spanish poet: b. Malaga 25 June 1860. He won great popularity with his lyric poems, and several of his dramatic compositions have been very successful. 'A Morisco Episode'; 'The Young Men of the Day'; 'Two Husbands and a Wife.' In collaboration with other writers he has published a volume of 'Character Sketches from Madrid.'

Diaz de la Peña, Narcisse Virgile, dē'ăth dā lä pē'ñä, French painter b. Bordeaux 20 Aug. 1807; d. Mentone, France, 18 Nov. 1876. He was of Spanish parentage, and at the age of 15 was apprenticed to a porcelain painter, but ambitions of working in oils about 1831 began to exhibit in the Salon. He in time won fame by his landscapes, which he peopled with nymphs, loves, and satyrs. These figures are badly drawn, but as a colorist Diaz ranks highly among the painters of the romantic school in France, and to color he was content frankly to sacrifice form. He was also an exquisite painter of flower-pieces.

Diaz de Pineda, Gonzalo, gōn-thä'lō dē-ăth dā pē-ñā'dä, Spanish soldier: b. Torrelavega about 1500; d. Peru 1545. He went to Peru with Francisco Pizarro in 1531; explored the river Magdalena in 1535; and in 1539 became governor of the province of Quito. In 1540 he joined the expedition of Gonzalo Pizarro for the conquest of the Canelos and the exploration of the country east of the Andes. He was sent in search of the party of Orellana, who had gone ahead to seek for supplies. In the course of the search, which was unsuccessful, Diaz explored a large part of the course of the Amazon, but returned to the main expedition, which by his aid succeeded in returning to Peru, though with heavy losses. When Gonzalo Pizarro revolted against the viceroy, Nuñez, Diaz at first offered his services to the viceroy, but later joined Pizarro. He was surprised and defeated by Nuñez, but escaped capture.

Diaz de Solis, Juan. See SOLIS, JUAN DIAZ DE.

Dib'din, Charles, English lyric and dramatic poet and actor: b. Southampton March 1745; d. London 25 July 1814. He opened a little playhouse in London, the Sans Souci Theatre, and there brought out his own plays, enlivened with his own songs, set to music of his own composition, and with himself as the leading actor. He wrote probably 50 plays and operettas (best remembered among them 'The Quaker,' an operetta), two novels, a 'History of the Stage,' and over a thousand songs. His 'Sea Songs,' such as 'Tom Bowling,' and 'The Flowing Can,' are popular favorites still. He wrote an autobiography: 'Professional Life' (1803).

Dibdin, John Thomas, English song writer and dramatist: b. London 21 March 1771; d. there 16 Sept. 1841. He was the second son of Charles Dibdin (q.v.), and in 1775, when only in his fourth year, was brought upon the stage as the Cupid of Shakespeare's 'Jubilee,' while Mrs. Siddons personated Venus. After being connected with various theatres, and writing great numbers of songs, he returned to London in 1795, wrote a number of dramas with great success for the minor theatres, and obtained an engagement at Covent Garden, with which he continued connected for 14 years. Among his numerous pieces the best known are: 'Mother Goose,' by which the theatres are said to have netted a profit of $100,000; the 'High-mettled Racer,' which was almost equally profitable; 'The Cabinet'; 'The Jew and the Doctor'; and 'Past 10 O'clock,' which long held the stage. He wrote a 'Metrical History of England' (1813); and 'Reminiscences' (1827).

Dibdin, Thomas Frognal, English bibliographer, son of the elder brother of Charles Dibdin (q.v.), the celebrated naval song writer: b. Calcutta 1776; d. Kensington 18 Nov. 1847. He became a popular preacher in London, and was well known there as a bibliomaniac. He proposed a club to dine together in honor of bibliography, which was established in 1812, under the name of the Roxburghe Club. This club adopted a rule that each member should every year reprint a book for presentation to all the members. Of his numerous writings those connected with bibliography are alone of any value. Among them may be noted: 'Bibliomania' (1809); 'Bibliographical Decameron' (1817); 'Typographical Antiquities of Great Britain' (1810–19).

Dibranchiata, dī-brăn-kī-ā'tà, an order of cephalopods (see CEPHALOPODA), characterized by the possession of two gills only, and by the fact that the shell, if external, as is rarely the case, is never chambered. It includes the cuttlefishes, squids, and paper nautilus, as well as the extinct family of *Belemnitidæ*. The order contains two sections, *Octopoda* and *Decapoda*.

Dibutades, dī-bū'ta-dēz, Greek sculptor or potter of Sicyon: lived about 600 B.C. Although he is the reputed originator of work in relief, the only historical basis for his fame is a Corinthian work, bearing his name, supposed to date from before 600 B.C.

Dice (plural of **Die**), small cubes of bone, or ivory, on each of the six sides of which a number, ranging from one to six, is marked permanently. The sum of the two numbers on the opposite sides of a die is always seven; thus if six is at the top one is at the bottom, and so on. One, two, three, or five dice are used, according to the game to be played. It, or they, are placed in a cylindrical box about four inches high, and from one and a half to two inches in diameter, open at the top. The box is shaken and turned quickly up so that the dice will fall flat on the table. The aggregate amount of the spots uppermost at each throw are summed up and placed to the score of the thrower. The purposes to which the throwing of dice is put are endless, besides the many games in which they are used in a variety of ways. The principal games are "throwing the dice," "round the spot," "centennial," "multiplication," "going to Boston," "draw poker," and "vingt-un," all of which will be found described in detail with the rules of each game in A. Howard Cady's 'Dice' (1895).

There is no period of history, and no nation, in which some form of dice has not been used. They are depicted on the early Egyptian monuments; those excavated at Thebes can scarcely be distinguished from the dice made to-day, and their use is attested by laws regulating the games played with them in ancient Greece and Rome, as well as in most European countries.

The invention of dice is attributed to Palamedes (circa 1,244 B.C.). But the use of cubes with numbered sides for gambling purposes is probably much earlier.

The Latin word for dice, *tesseræ*, is derived from the Greek *tesseres*, Ionic for *tessares*, four, because it is on every side square. Numerous passages in the ancient writers, and very many representations in marble or paintings, show how frequent dice-playing was among them. Different from the *tesseræ*, which were precisely like our dice, were the *tali* (which means, originally, the pastern bone of an animal — Greek, *astragalos*). These were almost of a cubic form, and had numbers only on four sides, lengthwise. Three *tesseræ* and four *tali* were often used together, and the game with dice was properly called *alea*, though *alea* afterward came to signify any game at hazard, and *aleator* a gambler.

Dicentra, dī-sĕn'trạ, a genus of plants of the poppy family (*Papaveraceæ*), now generally known as *Bicuculla*, original spelling *Bikukulla*, Greek for double-hooded. The genus numbers about 15 species, natives of North America and western Asia. The best-known American species are the Dutchman's Breeches (*B. cucullaria*), and bleeding-heart (*B. crimia*). The common squirrel-corn (*B. canadensis*), is also a member of the genus. The Dutchman's Breeches grows in woods from Nova Scotia to Lake Huron, Mich., and Washington, south to North Carolina and Missouri. Bleeding-heart is found in rocky places from the western part of New York, south to Georgia and Tennessee, along the mountain ranges.

Dicerathe'rium, an extinct genus of rhinoceroses which inhabited North America during the Oligocene Epoch, distinguished by a pair of horns one above each eye, instead of on the middle line of the head.

Dicey, Edward, English journalist and author: b. Leicestershire, England, 1832. He was graduated at Trinity College, Cambridge, and was from 1870 to 1889 editor of the 'Observer.' He has published: 'Rome in 1860' (1861); 'Cavour: a Memoir' (1861); 'Six Months in the Federal States' (1863); 'The Schleswig-Holstein War' (1864); 'The Battlefields of 1866' (1866); 'A Month in Russia During the Marriage of the Czarewich' (1867); 'The Morning Land' (1870); 'Victor Emmanuel' (1882); 'England and Egypt' (1884); 'Bulgaria, the Peasant State' (1895); 'The Story of the Khedivate' (1902).

Dichot'omous (Gr. "divided into two equal parts"), a term specifically used in botanical description to designate any appearance of branching by forking. Thus the stems of some phanerogams — for example, mistletoe, doum-palm, and many inflorescences — for example, *Caryophylleæ*, begonias — appear forked, while an ordinary fern-frond has no such appearance. The progress of morphological research has, however, shown that true dichotomy — for example, complete division of the growing point into two lateral apices, is really as characteristic of development of the fern-frond as of such obviously dichotomous vegetation as that of *Selaginella;* while conversely the appearance of forking in phanerogams comes about simply by the suppression of the growing point, and the development of two new axes from opposite lateral buds. Outside the cryptogams, indeed, no case of true dichotomy has been described, with the doubtful exception of the roots of cycads. See CRYPTOGAMIA; CYCADS; FERNS.

Dichot'omy in logic, a distribution or separation of ideas by pairs; the division of a class into two sub-classes opposed to each other by contradiction, binary classification as revived by Ramus against the Aristotelians; the Platonic doctrine that all classification should be by dichotomy. Since Kant this opinion has found scant favor.

In botany, a term applied to that kind of branching by a constant furcation or division into two parts, as where the stem of a plant branches into two branchlets, each of which in its turn divides into others, and so on. Example, the mistletoe. The veins of various ferns thus branch dichotomously.

In astronomy, that phase of the moon where it appears bisected or is only half illuminated, as at the quadratures.

Dichro'ic Crystals, so called from their property of exhibiting two colors when polarized light is passed through them in different directions. Thus dichroite, a mineral described below, appears deep-blue in the direction of the principal axis, and yellowish-brown in a direction at right angles to it, even when viewed with ordinary light. Brewster gives a list in his 'Optics' of over 30 crystals which exhibit this property with the aid of a polariscope. The name trichroic is applied to crystals which exhibit three colors when viewed in three directions.

Dichroic Crystals, those which exhibit dichroism (q.v.).

Dichroism (Greek, *dis*, "twice," *chroa*, "color"), the property which many colored doubly refracting crystals have of exhibiting

different colors in different directions. Thus the color of a green tourmaline appears very much darker in the direction of the vertical axis than when the crystal is viewed at right angles to that axis. As in many instances three colors are exhibited, the term "pleochroism" (Greek *pleon*, "more"; *chroa*, "color"), being of a more general character, is often used. A crystal of iolite (dichroite) appears blue in the direction of the vertical axis, yellowish-white in the direction of the macro-axis and bluish white in the direction of the brachy-axis. Dichroism is best detected by the instrument known as the dichroscope. This consists of a rhomb of Iceland spar with wedges of glass cemented at each end of it. These are enclosed in a metal cylinder with a lens at one end and a square opening at the other. If a section of a dichroic crystal is placed in front of the orifice and is viewed through the instrument, two colored squares are seen side by side, one corresponding to the ordinary ray, the other to the extraordinary ray. Dichroism may also be observed by means of the polarizing microscope, by removing one of the nicols and revolving the stage. This furnishes a method of determining in rock sections biotite, tourmaline, epidote and hornblende, all of which are dichroic. Thus hornblende is easily distinguished from augite, which is not dichroic. Optically uniaxial crystals, or those belonging to the tetragonal and hexagonal systems, are dichroic; optically biaxial crystals, or those belonging to the orthorhombic, monoclinic and triclinic systems, are trichroic. Isotropic bodies, including isometric crystals and also amorphous substances such as opal and glass, transmit the same color in any direction. Dichroism, or the allied term "Dichromatism," has also been applied to those fluids which appear of different colors when viewed by reflected and refracted light; when seen in thick or thin layers, etc. For example, venous blood, or any blood impregnated with carbonic acid, hydrogen, or nitrogen, appears, when seen in moderately thin layers, to be of a purple color; while in extremely thin layers it appears green. This property of marked color-variation is due to the difference in the absorption of the light-vibrations in different directions. The property of dichroism is a great aid to the jeweler in distinguishing gems. Diamonds, spinels and garnets show no dichroism; sapphire, ruby, emerald, beryl, tourmaline, topaz and chrysoberyl all have characteristic dichroism.

Dick, James, Scottish merchant: b. Forres, Morayshire, November 1743; d. 24 May 1828. He left over $565,000 to promote higher learning among the parish schoolmasters of the shires of Elgin, Banff, and Aberdeen. The annual value of the bequest exceeds $20,000, allowing a payment of about $150 to each teacher participating.

Dickcissel, dĭk-sĭs'sĕl, or **Black-throated Bunting** (*Spiza americana*), a species of finch in which the male is easily distinguished by a conspicuous jet-black throat-patch on a light yellowish background; the upper parts in both sexes are grayish brown variously streaked above with both lighter and darker shades. During the nesting season the black-throated bunting inhabits cultivated fields of the eastern United States, especially southerly. It winters in South America. The song is a very simple unmusical ditty, and the nest is built on or very near to the ground.

Dickens, Charles, English novelist: b. Landport, Portsmouth, 7 Feb. 1812; d. Gadshill, near Rochester, England, 9 June 1870. His earliest years were passed chiefly at Chatham and in London, where his father, a very careless and improvident man, spent some time along with his household in a debtors' prison. Charles about this period, and while still a mere boy, was a drudge in a blacking warehouse. He got but little education, but about 1826 became an attorney's clerk, and while in this position studied shorthand and other subjects, and finally was able to exchange his occupation for that of a newspaper reporter and critic. In 1835 he was engaged on the *Morning Chronicle*, then one of the leading daily papers of the metropolis. On 9 June 1835 appeared the first of the series of 'Sketches of Life and Character by Boz,' which were published in the evening edition of that paper, under the title of 'Thoughts About People, by Boz.'

The 'Sketches by Boz, Illustrative of Every-day Life and Every-day People' were published in 1836, with illustrations by George Cruikshank. From this publication may be dated the origin of Dickens' fame. Chapman and Hall engaged him to prepare the letterpress for a series of comic sketches on sporting subjects, the outcome of which was the immortal 'Pickwick Papers' (1837). Great characteristics of Dickens' genius were now fully apparent, and his fame rose at once to the highest point.

The next important literary engagement of Dickens was with Bentley's 'Magazine,' which he edited for two and a half years under the pseudonym of Boz. In these volumes appeared 'Oliver Twist' (1839). Before the completion of 'Oliver Twist,' 'Nicholas Nickleby' was begun, and like Pickwick was published in monthly shilling parts. It was issued complete in 1839. Accompanying it, besides the usual illustrations, is a portrait by Maclise, in which the author is represented as "a somewhat dandified young man in a high velvet-collared coat."

'Master Humphrey's Clock,' issued in weekly numbers, contained among other matter two other leading tales, 'The Old Curiosity Shop,' and 'Barnaby Rudge,' the latter a historical tale, going back to the time of the Gordon riots. Both were published separately in 1841. The same year he visited America for the first time. Here many aspects of society struck him in a curious light, and on his return he wrote 'American Notęs for General Circulation' (1842). His next novel, 'Martin Chuzzlewit' (1844), dwelt again on his American experiences.

The series of 'Christmas Tales' excited a new sensation of wonder and delight. These tales were: 'A Christmas Carol' (1843); 'The Chimes' (1844); 'The Cricket on the Hearth' (1845); 'The Battle of Life' (1846); 'The Haunted Man and the Ghost's Bargain' (1847). In 1845 Dickens went to Italy, and paid a visit to Rome, and on 1 Jan. 1846 in the first number of the *Daily News* appeared the first chapter of his 'Pictures from Italy.' Immediately after this followed 'Dealings with the Firm of Dombey and Son, Wholesale, Retail, and for Exportation' (1848); and 'David Copperfield' (1849–50). In 1850 Dickens commenced to edit the weekly serial, 'Household Words,' in

which various original contributions from his own pen appeared. Later works were: 'Bleak House'; 'A Child's History of England' (1852–4); 'Hard Times' (1854); and 'Little Dorrit,' commenced in 1857. In 1859 'All the Year Round' superseded 'Household Words'; and in the first number of this periodical, 28 May, was begun 'A Tale of Two Cities.' 'Great Expectations' followed in the same paper (1860). In 'All the Year Round' also appeared a series of disconnected sketches, called 'The Uncommercial Traveller' (1868). 'Our Mutual Friend' (1865) was the last great serial work which Dickens lived to finish.

The first number of Dickens' last work, 'The Mystery of Edwin Drood,' was issued on 1 April 1870, and only three numbers had appeared at the time of his death. Three other numbers were published from the MSS. he had left, but the story remained unfinished.

Dickens married in 1838 the daughter of George Hogarth, a musical writer and critic. In the same year he openly avowed the authorship of Pickwick. He had a decided taste for theatricals, and was a successful amateur performer. He frequently turned his talent in this way, and as a public speaker, to charitable purposes. He was also an admirable reader, and during the last 15 years of his life made frequent reading tours in which he gave semi-dramatic readings from his own works to appreciative audiences. He visited the United States a second time in 1867–8 on a reading tour. The enthusiastic reception he met with caused him somewhat to modify the severe opinions he had expressed in his 'American Notes,' and a sort of apologetic note was prefixed to the next edition of them, with the desire expressed that it should accompany all future editions. He was buried in Westminster Abbey. See Forster, 'Life of Dickens' (1872–4); Fitzgerald, 'The History of Pickwick' (1891); Kitton, 'The Novels of Charles Dickens' (1897); and 'The Minor Writings of Charles Dickens' (1900); Gissing, 'Charles Dickens: a Critical Study' (1898). In 1880–2 his eldest daughter edited his letters.

Dickens, Charles, English editor: b. 1837; d. Kensington, England, 20 July 1896. He was the eldest son of the preceding; was educated at King's College, Eton, and at Leipsic; became assistant to his father as editor of 'All the Year Round,' and subsequently chief partner in a printing firm. He edited a 'Life of Charles Mathews'; 'The Dictionary of London'; 'Paris and the Thames'; and a complete edition of his father's works.

Dickens, Mary Angela Evans, English novelist: b. 1838. In 1861 she married the eldest son of Charles Dickens. Her best-known novel is 'A Mere Cipher' (1893). She has also written: 'Cross Currents' (1892); 'Valiant Ignorance' (1894); 'Some Women's Ways,' a volume of short stories; 'Prisoners of Silence' (1895); 'Against the Tide' (1897); 'On the Edge of a Precipice' (1899); 'The Wastrel' (1901).

Dick'erman, Lysander, American Egyptologist: b. Bridgewater, Mass., 1830; d. Boston, Mass., 13 Dec. 1902. He was educated at Brown University and Andover Theological Seminary, and entered the Congregational ministry in 1858. He held various pastorates in New England, Illinois, and California, and in his later years devoted much attention to Egyptology, publishing: 'The Egyptian Deities' (1885); 'The Hittites of the Bible' (1889); 'The Fayam' (1892); 'Mariette Bey's Monument of Upper Egypt' (1900).

Dickey, Charles Andrews, American Presbyterian clergyman: b. Wheeling, W. Va., 25 Dec. 1838. He was educated at Washington College, Pennsylvania; studied at the United Presbyterian Theological Seminary 1858–61; and was pastor of the United Presbyterian Church, Allegheny City, Pa., 1861–9; the First Presbyterian Church, St. Louis, 1869–75; Calvary Presbyterian Church, Philadelphia, 1875–93; and has been pastor of the Bethany Presbyterian Church, Philadelphia, from 1893. He was moderator of the Presbyterian General Assembly 1900–1, and during his pastorate in Philadelphia was prominently associated with all the benevolent operations of his Church.

Dickie, George William, American engineer: b. Arbroath, Scotland, 17 July 1844. He studied engineering in his father's shipyard, and with the North British Railway Company, and came to the United States in 1869. He was engaged in steamship work on the Pacific coast, designed machinery for the Comstock mines, became president of the Union Iron Works in 1883, giving especial attention to naval work. He has written: 'Pumping and Hoisting Works' (1876).

Dickins, John, American Methodist clergyman: b. London, England, 24 Aug. 1747; d. Philadelphia, Pa., 27 Sept. 1798. He was educated at Eton and emigrated to America prior to the American Revolution. Becoming a Methodist in 1774, he entered the ministry, becoming one of the most notable preachers of his day. He was instrumental in founding Cokesbury College, Maryland, and the Methodist Book Concern.

Dickinson, Anna Elizabeth, American orator, novelist, and playwright: b. Philadelphia 28 Oct. 1842. At the outbreak of the Civil War she became known as a speaker, and under the stimulus of the great events became an orator of great power and persuasiveness, who created by her youth, real pathos, and brilliant rhetoric the greatest enthusiasm wherever she was heard. She was called the "Joan of Arc" of the War. Some of her books are: 'What Answer' (1868), a novel; 'A Paying Investment' (1876); 'A Ragged Register of People, Places, and Opinions' (1879). She was the author of two plays of excellent dramatic quality: 'Anne Boleyn,' and 'Marie Tudor' (1875), in which she played the title roles.

Dickinson, Charles Monroe, American author: b. Lowville, N. Y., 15 Nov. 1842. He was admitted to the bar in 1865, and practised law until 1877 in Binghamton and New York; in 1896 he was elected presidential elector, and has been United States consul-general to Turkey from 1897. He has published a book of poems entitled 'The Children and Other Verses' (1889), the title poem of which has received remarkable popularity; and a 'History of the Dickinson Family' (1885).

Dickinson, Daniel Stevens, American lawyer: b. Goshen, Conn., 11 Sept. 1800; d. New York 12 April 1866. He was admitted to the

New York bar, where he soon became prominent; was elected to the State Senate in 1836, and became a leader in the Democratic party, which made him lieutenant-governor in 1842, and in 1844 sent him to the United States Senate. There he became known for his pro-slavery and States-rights proclivities, and was made chairman of the Finance Committee. He was brought forward as a candidate for the presidency in 1852, but without success. He spent the later part of his life at Binghamton, N. Y., in the practice of his profession.

Dickinson, Donald McDonald, American lawyer: b. Port Ontario, N. Y., 17 Jan. 1846. He was graduated at the law department of the University of Michigan in 1866, and began the practice of law in Detroit, where he rapidly rose to a foremost position at the bar; and later practised in Washington, D. C. He was conspicuous in politics as a Democrat; was secretary of the Democratic State Central Committee, which managed the Greeley campaign in 1872; withdrew from the Democratic party, but was won back by Mr. Tilden; and was chairman of the Democratic National Committee in 1876; and a member of the committee in 1884–5. He was postmaster-general of the United States in 1887–9; chairman of the Democratic National Campaign Committee in 1892; and senior counsel for the United States before the Joint High Commission on the Bering Sea claims, under the Fur Seal Arbitration in 1896–7.

Dickinson, Emily, American poet: b. Amherst, Mass., 10 Dec. 1830; d. there 15 May 1886. Living the life of a recluse, she wrote much verse in forms peculiar to herself, but she published almost nothing; although the few pieces that appeared attracted much attention. In 1890 a collection of her poems was issued which received warm praise from competent critics; another in 1892; and her 'Letters' in 1894.

Dickinson, John, American political writer and statesman: b. Maryland 13 Nov. 1732; d. Wilmington, Del., 14 Feb. 1808. He wrote a series of state papers: 'Address to the Inhabitants of Quebec'; 'Petitions to the King'; 'Address to the Armies,' that had great influence in their day. He was the author of 'Letters from a Pennsylvania Farmer to the Inhabitants of the Colonies' (1767); and 'Essay on Constitutional Power of Great Britain over the American Colonies' (1774). Dickinson College at Carlisle, Pa., was named in his honor.

Dickinson, Jonathan, American Presbyterian clergyman: b. Hatfield, Mass., 22 April 1688; d. Elizabethtown, N. J., 17 Oct. 1747. He was graduated at Yale College in 1706, and soon afterward was installed as pastor of the Presbyterian congregation in Elizabethtown, N. J., which relationship continued until his death. After the separation of the New Jersey churches from the synod of Philadelphia in 1741, it was determined to establish a collegiate institution in the former colony, and a charter for the College of New Jersey (now Princeton University) was obtained. The first classes were opened in Elizabethtown, and Dickinson was elected president.

Dickinson, Martha Gilbert, American poet: b. Amherst, Mass. She is a niece of Emily Dickinson (q.v.), and was married to Alexander E. Bianchi 24 July 1903. She has published: 'Within the Hedge'; 'The Cathedral and Other Poems.'

Dickinson, Mary Lowe, American educator and author: b. Fitchburg, Mass., 1839. She was married to John B. Dickinson, a New York banker, and after his death taught in schools in Boston, Hartford, and New York, being for some time principal of the Van Norman Institute in the last-named city. She edited the 'Silver Cross' magazine for 10 years, and is now the editor of 'Lend a Hand.' She has published several volumes of fiction and a collection of poems.

Dickinson College, a coeducational institution in Carlisle, Pa., founded in 1783, under the auspices of the Presbyterian Church. The government of the school was changed somewhat in 1833, and it came under the charge of the Methodist Episcopal Church. In 1902 the number of students enrolled was about 490, and the number of volumes in the library was 35,000.

Dickson, Frank, English artist: b. near Chester, England, 1861. He was educated at Liverpool College, and studied art in the Royal Academy Schools. He has exhibited often in the Royal Academy as well as in many English galleries, and in Australia.

Dickson, Samuel Henry, American physician: b. Charleston, S. C., 20 Sept. 1798; d. Philadelphia 31 March 1872. He was graduated at Yale College in 1814, and immediately after commenced the study of medicine in his native city. He was instrumental in the establishment of a medical college in Charleston, and on its organization in 1824 he was called to the chair of institutes and practice of medicine. In 1858 he was called to the chair of practice of medicine in the Jefferson Medical College, Philadelphia, which he held till his death. He was author of 'Manual of Pathology and Practice of Medicine'; 'Elements of Medicine' (1835); 'Essays on Pathology and Therapeutics' (1845); 'Essays on Life, Sleep, Pain, etc.' (1852). It is a fact worthy of note that he delivered the first temperance address ever heard south of Mason and Dixon's line.

Diclinous, dī-klī'nŭs or dī-klī'nŭs, a Linnæan term for flowers possessing stamens or pistils only — *Monœcia, Diœcia,* and *Polygamia.*

Dicotyledon, dī-kŏt ĭ-lē'dŏn, a plant having two cotyledons or seed-leaves, that is, primordial leaves, contained in the embryo. The majority of flowering plants have this structure. When therefore seed is sown, in most cases the future plant first appears above the ground as a tiny two-leaved existence, and in certain cases the next pair of leaves which appear, and all the future ones, are of a different structure from the first. The primordial pair of leaves are the two cotyledons. Their use in the economy of nature is to shelter the ordinary leaves situated inside. In the plural the highest class of the vegetable kingdom, containing orders of plants with the structure of seed just described. It is a natural division and has other characteristics than that now mentioned; specially, new wood is added to the old externally, whence these plants are very often termed exogens. The dicotyledons comprise at least two thirds of all known plants.

Dicrot'ic Wave, a double beating, as in the human pulse. Each pulse-wave begins with an ascent corresponding to the systole of the heart. This ascent usually forms, as registered by the sphygmograph, an unbroken line until the apex of the curve is reached and the descent commences. The descending curve is marked by several minor waves, one of which being quite pronounced is known as the dicrotic wave, and is probably due to a reflection of the arterial tension on the periphery.

Dicta'tor, an extraordinary magistrate of ancient Rome, first appointed 501 B.C. At first no one was eligible to the office who had not been previously a consul. The power of naming a dictator, when an emergency arose requiring a concentration of the powers of the state in a single superior officer, was vested by a resolution of the senate in one of the consuls. A plebeian dictator was first appointed 356 B.C. The dictatorship was limited to six months, and the person who held it could not go out of Italy. The dictator had the power of life and death, and could punish without appeal. All the other magistrates were under his orders. He had 24 lictors, double the number allowed to a consul. Such were the dictators appointed to carry on the government of the state in special emergencies; but dictators were often appointed for temporary purposes, especially during the absence of the consuls. The object of these temporary appointments was generally to secure the discharge of some function which could only be lawfully performed by the first magistrate, as the holding of the comitia (or meetings) for the elections. The last dictator entrusted with the government of the state under the republic was appointed 216 B.C., the last temporary dictator 202 B.C. The office was revived by Sulla 82 B.C., and afterward held by Cæsar 48 B.C., but in these cases the legal restrictions were not regarded, and the office bore no resemblance but in name to the ancient dictatorship. It was abolished during the consulship of Antonius, 44 B.C. In more modern times usurpers have made themselves dictators. The rulers of Paraguay bore the title of dictator for a number of years, and those of other Spanish-American countries have done so from time to time.

Dictatorships in Latin-America. In Mexico, since the establishment of independence, there have been 10 acknowledged dictatorships, namely, those of Gen. Antonio Lopez de Santa-Anna, 1841 to 1842; Gen. Nicolás Bravo, 1842 to 1843; Santa-Anna again, in 1843; Gen. Valentin Canalizo, 1843 to 1844; Gen. Manuel María Lombardini, 1853; Santa-Anna again, 1853 to 1855; Gen. Rómulo Díaz de la Vega, 1855; Gen. Martin Carrera, 1855; Gen. Juan Alvarez, 1855; Gen. Ignacio Comonfort, 1855 to 1857. The "usual alternations of anarchy and military rule"—the long period of internecine strifes, during which one president after another was summarily deposed—drew to an end about 1876. Gen. Porfirio Diaz succeeded Tejada in May 1877. He was re-elected in 1884, and since that time has remained at the head of the government. In Paraguay, three years after allegiance to Spain was renounced, the congress in October 1814 decided to make Doctor (of theology) José Gaspar Rodriguez Francia dictator for three years. Before the expiration of his term of office, another congress decreed that his dictatorship should be perpetual. He died 20 Sept. 1840. Francisco Solano Lopez (10 Oct. 1862 to 1 Mar. 1870), though constantly referred to as a dictator, was officially known as "president of the republic." By an act of congress, 16 Oct. 1862, he was made "president of the republic for 10 years," his father, Carlos Antonio Lopez, having been president during the 18 years immediately preceding, that is, from 1844 to 1862. In Bolivia there was at first no need to employ the word dictator, simply because the constitution of that country, framed by Bolivar and accepted without change or even debate by the congress at Chuquisaca, 25 May 1826, conferred ample dictatorial powers upon a "president" who should hold office for life; nevertheless the higher title was repeatedly assumed or conferred (see BOLIVIA for list of presidents and dictators). In Colombia (when it included New Granada, Venezuela, and Ecuador), we find, first, military dictatorships established before 1827 by Paez in Venezuela and by Mosquera in Ecuador; and then the dictatorship of Bolivar, who assumed absolute sovereignty in 1828 over the entire Colombian federation. Almost immediately afterward the federation broke up. The racial aversion to such steady co-operation as the situation called for was intensified by extravagant theories touching the so-called sovereignty of each individual citizen. Thus, it was not merely true that the 21 wretched "sovereign states" of Venezuela could repudiate pecuniary obligations or violate treaties with impunity; that any of the states of New Granada could nullify a law of the federal congress; but it has been well said that every man fancied that he was governed by a "higher law" inherent in himself, and "when he declared against the government he was not a traitor, but only a revolutionist, asserting his inherent right as a 'sovereign.'" In Colombia, from 1830 to 1861, there was a revolutionary outbreak on an average every second year; Ecuador generated a revolution and a new constitution every four years; Venezuela was even more distressed by anarchy. Acceptance of a military despot seemed to be the only escape from these intolerable conditions. The revolutionist Mosquera declared himself dictator of the diminished Colombia in 1867. In Venezuela, as a separate country, the first ruler is sometimes called dictator, sometimes president; he was both by turns, and repeatedly. Similar versatility was exemplified in the troubled lands from Mexico to the far South: as a Venezuelan fashion it easily survived its forceful exponent, Paez. Three short-lived dictatorships were set up in succession just before Crespo entered Caracas in 1892. In Ecuador, the first Flores called a convention (1843) which expressed the temporary desire to entrust him with a magistracy so far above all others that it is superior even to the laws themselves. Again, on 2 April, 1882, President Veintemilla seized power as a dictator and held it for a year. In Peru, Gen. Bolivar was supreme dictator, both during and after the struggle for independence, his license having been granted by the revolutionary congress of 1824 and confirmed in 1826. In Argentina, Juan Manuel Rosas accepted (7 March 1835) an almost unrestricted dictatorship which was offered to him in the hope that he would restore order. He reigned "in a horrible manner, like a madman" up to the day of his defeat, 3 Feb. 1852. In Brazil, the

first national congress convened on 15 Nov. 1890, after the expulsion of Dom Pedro II. One year later (Nov. 1891) President Fonseca proclaimed himself dictator on the strength of an invitation of officers of the Brazilian army; but his navy turned its guns on him, and he resigned. In Chile, there have been fewer revolutions, more frequent instances of submission to the mandates of a privileged upper class; yet at the beginning of 1891 President Balmaceda broke with national traditions, to adopt those of the continent of South America: he announced that he was dictator, when he was, in fact, only a party leader; he declared himself to be in favor of martial law, and by superior force he was crushed (see CHILE). In the history of Uruguay, the word "dictator" is not prominent, though the irresponsible government of Artigas, a *Gaucho* ("Rough Rider") chief, bred disorder after 1814, and comparative stability was first assured after 1870, when the Paraguayan war ended. In Costa Rica (q.v.) several of the chief executive officers have been called dictators, with an intention somewhat less offensive because the policy of the government is conceded to have been, in certain respects, positively commendable. For the other republics of Central America and Santo Domingo, our readers are referred to the articles dealing with those countries, in which special circumstances are explained. The exercise of dictatorial powers by dictators without the name — rulers who had, or have, the title of president merely — will be found under SOUTH AMERICA.

MARRION WILCOX,
Authority on Latin-America.

Dictionary (Low Latin *dictionarium*, first used in the 14th century; from *dictio*, post-classical synonym for *verbum*, word). The various applications of the term, general and special, are so familiar that a detail would be of no service. Of its synonyms, it may be said that the Greek word "lexicon" is customarily restricted to a dictionary of ancient or Oriental languages, with definitions, etc., in the language of the supposed reader; "glossary" and "vocabulary" to dictionaries of the terms used in the special works to which they are attached. A glossary (called by the Germans *idioticon*, by the Italians *vocabolario*) is a defined list of unusual, antique, or foreign words; a vocabulary, in classical works sometimes called an index, belongs to a book in or text-book of a foreign language, and renders the foreign words into the reader's language, or the exercises of the latter into the foreign.

Functions.— The variation of kind with the variation of users and origin, common to all literature, is well exemplified in dictionaries. The original dictionary was a simple definer of words which a cultivated reading class was supposed not to know,— foreign, provincial, technical, obsolete, etc.; the modern dictionary of its own language attempted to exclude nearly all but the accepted vocabulary of current literature,— that is, what people knew already,— or at least what would be needed for such reading; the later ones increasingly include the means of understanding everything ever printed in a language. Two classes only, for obvious reasons, are still excluded (one of which the older ones gave), by reason of the change in audience from men to women and children: gross words, except a few too important philologically to be spared; and argot. The "abridged" dictionaries for many years, with ludicrous logic, excised the difficult words and retained the familiar ones; the first to exercise common-sense and reverse this plan was Jabez Jenkins in his wonderful "vest-pocket lexicon," whose near 30,000 words contained almost all the unusual ones and the pronunciational cruces. The attempts to draw a line in full dictionaries are now recognized as injudicious: that a word or form of a word has gone out of use is the very reason it should be defined or at least cross-referenced. An incomplete record of the language is by so much unserviceable. Part of the exclusions resulted from the growth of a half-educated middle class who looked to it as a standard of taste. The French Academy at first omitted all technical terms, and all words assumed below its standard of elegant usage; but as this made the book half useless, and the omissions were credited to the Academy's ignorance or carelessness instead of its fastidiousness, it could not be maintained. Recent dictionaries attain the same end by marking words as "obsolete," "little used," "provincial," "colloqnial," "slang," "vulgar," etc. The attempted arbitrament of pronunciations, though inevitable (being among the chief services for which they are consulted), will always remain a battle-ground embarrassing even to the umpires. Still more important, however, is a dictionary's value for the historical development of a language. No dictionary fulfils its best purpose which does not, as far as possible, trace the varying significations from their sources, with their development by metaphor or technical use; and any arrangement which obscures this is vicious; whatever temporary convenience may be subserved. As the validity of this development depends on citation of passages, these should be full, otherwise we have only the arbitrary assertion of the compilers. Back from even this lie the original etymologies of the words, which are of great value and even more interest; and the best dictionaries give them with their affiliations in other languages. All the irregular grammatical forms, and the particles by which words are inflected.— a sufficient grammatical apparatus for correct usage,— should be given as a matter of course. Syllabifications, divisions, etc., should also be indicated: in a word, the dictionary is a proof-reader's vademecum, and must contain all requisite material for him to use.

Arrangement.— The first condition of usefulness being that the items shall be easily found, no arrangement is tolerable except an alphabetical one, in all languages where the inflections are mainly terminal or after a consonant initial. This arrangement, however, may be used only in a key, making feasible other classifications for the main body; as in Roget's well-known 'Thesaurus' of synonyms, where the grouping is by ideas, in parallel column with the reverse ideas. This would be a very useful addition to the meagre lists of synonyms given in the large dictionaries; but it would need great labor and almost impossible accuracy of cross-referencing, as the group heads must be referred to from each word in its alphabetical place. A very useful variant is in the lists of technical terms of arts and sciences given under each main head in the 'Standard Dictionary.' Rhyming dictionaries are arranged alphabetically under the terminations. In etymological

dictionaries, attempts have been made to alphabetize by roots; but as no two scholars ever agree on the roots, the finding is largely guesswork, unless with a full alphabetical key, and scholars condemn the plan. In Semitic languages the arrangement is usually by roots. It was this necessity of arranging Volapuk dictionaries, owing to the prefix inflection involving a search in three or four places for one word, which as much as anything else prevented that "language" gaining favor. The arrangement of Chinese characters is almost incapable of any readily intelligible system, and is not settled by sinologists.

History.— The first dictionaries were used by the Assyrians and Babylonians, to explain not words, but signs. The ancient ideographs, when largely displaced by syllabified or alphabetic signs with phonetic values, rapidly became unintelligible; and syllabaries were therefore compiled, to define them in terms of the latter. The old Sumerian language, however, seems not then to have become "dead," being preserved by the colleges of priests for religious use; and foreign languages were learned from foreigners. These were inscribed in vertical columns, on clay tablets; they have been found in the great library of Asurbanipal (Sardanapalus — 668–626 B.C.), at Nineveh, the source of our chief knowledge of Mesopotamian culture. Much the same sort of syllabaries seem to have been used by the Chinese and Japanese.

The ancestry of our own dictionaries, however, is Greek. Here we observe the usual progression from the special to the general. The typical modern dictionary is a complete or representative vocabulary of a language, present and historical, with definitions in its own or some foreign tongue; its object being to interpret either the meaning of the foreign tongue or the bygone part of its own, or the usages and history of the latter. But neither of these was thought of by the ancients. The small upper and priestly class settled their own usages of language, there was no half-educated reading populace relying on books for correct form, there was no foreign literature they cared to read, and foreign conversation they learned from conversation. Their first dictionaries were the same as our special vocabularies. The oldest surviving one, by Apollonius of Alexandria in Augustus' time, was a glossary of Homer's words — probably the oldest of all kinds if we had them, Homer being the common text-book of Greece; others were of ambiguous, corrupt, barbarous, foreign, or dialectic phrases in the tragic and comic poets,— phrases Attic, Lacedæmonian, Cretan, Rhodian, Italian, Phrygian, etc.; others of technical terms in cookery, a fascinating subject to the Greeks; others of drinking vessels, of the cries of animals, of synonyms, etc. Besides glossaries of Homer, there were others of Plato, the Ten Attic Orators, Hippocrates, etc. All of these, so far as preserved,— unhappily, very few of them are preserved, and Athenæus in the 2d century gives the names of 35 lost to us,— are of priceless value both for words and antiquities. On a larger scale were the Onomasticon ("word-book") of Julius Pollux, arranged topically in 10 books, which has survived; and a great lexicon, now lost, written by Helladius of Alexandria about 400 B.C. Of others may be noted an etymological dictionary by Orion of Thebes about 450, the first we have,— for Varro's essays in Roman etymology can hardly be called a dictionary; a dialectic and local one by Hesychius of Alexandria, in the 4th century; and one of words similar in sound, but unlike in meaning, by Ammonius of Alexandria. Coming down to the Middle Ages, the most famous is that of Suidas, of unknown date or place, but probably about the 10th century; it is a slovenly compilation of words, names, and places, but extremely valuable from its matter, not to be had elsewhere. Overleaping some centuries and their works, we come in 1572 to the mightiest of all, the tremendous 'Thesaurus Græcæ Linguæ' of the famous French scholar and printer, Henri Estienne or Stephanus (q.v.), Geneva, 4 vols., folio, a work gigantic not only in size but in scholarship; it was last reprinted by Didot at Paris, 1831–65, ed. Dindorf, 9 vols. folio, 9,902 pages. All the mediæval and modern lexicons till the 19th century were Greek into Latin; the first Greek-English one was not till 1814, by John Pickering, and that was not finished; the first complete one was by John Jones, 1823, London. For many years the only general one on the market has been the Liddell & Scott, revised by Drisler, in its various editions. This, however, is confined to classic and early-empire forms, to common nouns, and to book words; and leaves need for several additional works. Later and mediæval Greek has been admirably covered by the lexicon of E. A. Sophocles, revised 1887 by J. H. Thayer; and a three-volume lexicon entirely devoted to the vast wealth of forms furnished by the inscriptions is in progress. Smith's dictionaries of antiquities and proper names are gone by, but the only ones in English; in German there are Pape's 'Greek Proper Names' (Griechische Eigennamen) 1875–90. There is one of modern Greek by Contopoulos, Athens, 1889; and there are special glossaries, New Testament and of various great authors, English-Greek, Yonge, revised by Drisler, latest edition 1893.

Less needful are details of Latin dictionaries, though they have been very plentiful; in the Middle Ages they were the daily necessity of all cultivated existence. They began much later than Greek: even the etymological treatise of the great M. Terentius Varro, Cicero's contemporary, preserved only in fragments, can hardly be called a dictionary; the first real one is of Verrius Flaccus under Augustus. One of Gutenberg's volumes' was the 'Catholicon' or 'Summa' of Johannes de Janua (Giovanni Balbi), 1460. The monk Calepino published in 1502 at Reggio a Latin-Greek lexicon, which was so famous that for many years all dictionaries were called "calepinos"; in 1575 it was made a polyglot of Italian, French, and Spanish as well, and in 1590 extended to all languages, and many times reprinted. Robert Estienne, father of Henri above, published in 1531 at Paris a great 'Thesaurus Linguæ Latinæ,' not supplanted till Forcellini's 'Totius Lexicon Latinitatis' in 1771, at Padua. All these were Latin into Latin, except that the latter had definitions also in Greek and Italian. A new edition, largely supplemented, Prato, 1858–79, forms the greatest Latin dictionary ever published. The first Latin-English dictionary was the 'Promptorium Parvulum' of a Norfolk monk, Galfridus Grammaticus, compiled 1440,

printed 1499; the first important one was by Sir Thomas Elyot, London, 1538. In the 18th century Robert Ainsworth's was for many years the only popular one (London, 1736). At present the two general popular ones are White & Riddle's (London, 1880), and Harper's (Andrew's Freund, revised by Lewis and Short, 1886). The great German-Latin one is Georges', 4 vols., Leipsic, 1880–5. The English-Latin are Smith & Hall, 1890; White & Riddle, 1869. A giant 'Thesaurus' was started in Leipsic, 1900, to outrank any other Latin lexicon in existence; it is to be edited by the greatest German scholars, under the supervision of the five great German academies, and has not yet finished the letter A. The great dictionary of mediæval Latin is Du Cange's, 1733–6, re-edited Paris 1882–8, 7 vols.

For modern European languages into English and *vice versa*, the following are standard: French — Smith, Hamilton & Legros, 1891; Spiers & Surenne, 1891; Gasc, 1895. German — Thieme-Preusser, 1898; Flügel, 1891; Lucas, 1854–68; Whitney, 1877, valuable for etymology; Adler's, 1875, still unequaled for discrimination of synonyms. Spanish — Velazquez, revised by Gray and Iribas, 1901 (the old Velazquez's Seoane revised with a great new technical vocabulary). Portuguese — Lacerda, 1871; Michaelis, 1894; Valdez, 1879. Italian — Baretti, 1877; Meadows, 1869; James and Grassi, 1884; Millhouse, 1899. Dutch — Calisch, 1890. Danish — Ferrall, Repp & Rosing, 1873. Swedish — Wenström & Lindgren, 1889; Nilsson, Widmark & Bollin, 1889. Norwegian — Geelmuyden, 1886. Russian — Alexandrov, 1879. Turkish — Redhouse, 1880. Polish — Baranowski, 1884. Hungarian — Bizonfy, 1878–86.

The great foreign dictionaries of their own languages, corresponding to the 'Century Dictionary' or the 'New English Dictionary' of our own, are: French — Littré's, 4 vols., 1863–72, supplement 1878–82. Larousse's rich work is an encyclopædia. German — Jacob and Wilhelm Grimm, etc., the first volume published 1854, and the work is still unfinished. The brothers Grimm died 1859–63, and a succession of scholars have carried it on, but the parts appear slowly. Italian — Tommaseo and Bellini, four volumes in eight, 1861–79. Castilian Spanish — Dictionary of the Spanish Academy; Donadiu and Puignau, 1890–95; Cuervo's unfinished work, 1866–94. There is also a two-volume dictionary of Catalan, by Lobernia and Esteller. There are of course many other smaller but valuable etymological and historical dictionaries. Of other languages may be mentioned: Portuguese — Caldas Aulete, 1881. Provençal into French — Mistral, 1886. Sardinian into Italian, and *vice versa*, Spano, 1851. Dutch — Dale, 1885–9; Franck, 1884–92. Swedish — Kalkar, unfinished. Icelandic — Cleasby and Vigfusson, 1874. Welsh — Evans, 1887, unfinished. Irish — Foley, 1855; O'Reilly, supplement by O'Donovan, 1864. Russian — Dahl, 1862–73. Polish — Rykaczewski, 1866. Slavonian — Miklosich, 1886. Turkish into Arabian and Persian, Zenker, 1866–76. Chinese into Latin, De Guignes, 1877; into French and Latin, 1869. Annamese — Pauthier, in Chinese characters with pronunciation in Chinese and Annamese.

Though Oriental and ancient, their close connection with our racial and religious ancestry and current problems makes Sanskrit and Hebrew worth noting separately. For the former, the great English works are by Monier-Williams: English-Sanskrit, 1851; Sanskrit-English, 1872. Hebrew, Fürst, 1867.

English lexicography on its own language begins very humbly, with John Bullokar's 'English Expositor,' 1616. More famous was Henry Cockeram's, 1623, which passed through nine editions up to 1650. Blount (1656), Philips (1658), and Coles (1677) succeeded these; but the first attempt at a thorough collection was Nathan Bailey's (1721.) This gave etymologies, marked accents, and remained the sole possessor of the field till Johnson's appeared in 1755; and was reprinted over a quarter of a century longer from its handy size, the 24th edition dating 1782. Johnson's, however, is the first of any importance from a scholar's point of view. The etymologies are superseded, but he was the first to make a dictionary something like a history of the language, with full (even over-full) illustrative examples, precise definitions, and attention to the form. It has been reprinted as late as 1866, but for popular use is superseded even in England by the great American dictionaries, and for scholars by special works. It did not mark pronunciation except by accents, like Bailey's. The first to enter on this unending task was Kenrick (1773); then came Perry (Boston, 1777); Thomas Sheridan (1780), the elocutionist, father of the great dramatist; Walker (1791), of immense vogue in its time and still cited as an authority, though entirely out of date; Smart (1836), based on Walker; all making their first claim as arbiters of elegant taste. Richardson (1836) was primarily for etymologies. Ogilvie's 'Imperial Dictionary' (1850, new ed. 1883) was the first of the great encyclopædic dictionaries; the 'Century Dictionary' was at first intended only as a slightly revised reprint of Ogilvie, but swelled into the magnificent work so well known. Previously, another English work of the sort had appeared, Hunter's, 1879–88. But the one monumental English dictionary is to be the 'New English Dictionary on Historical Principles,' edited by James A. H. Murray and Henry Bradley, greatly assisted by the late Fitzedward Hall, from matter collected by the Philological Society. It has reached the letter R at this writing, and will take several years to complete; and will form an absolute history of all English words and meanings. Noah Webster's first dictionary was in 1806, but the first edition of his epoch-making 'American Dictionary' was in 1828. This has become the 'Webster's International Dictionary' of 1890; always connected with Yale College scholarship, through Webster's son-in-law, Chauncey A. Goodrich, and later through Noah Porter. Webster was the founder of American lexicography, and by his enthusiasms and original ideas has left a permanent impress on American usages, even where his pet notions have been discarded. His work brought out its chief rival for many years, 'Worcester's Dictionary' (1860), by a scholar who had assisted him but disliked his innovations, and wished to substitute elegant usage for what he thought Webster's barbarisms. It had great influence for a generation, and has a tenacious tradition yet. The 'Standard Dictionary' (1893–5) is a medium between the com-

pression of Webster and the encyclopædic magnitude of the 'Century.'

Among special dictionaries may be named Jamieson's 'Etymological Dictionary of the Scottish Language,' 4 vols., 1870–82, with a supplement 1887; Wilson's 'Glossary of British India,' 1851, and Yule & Burnell's 'Anglo-Indian Words and Phrases,' 1886; Wright's 'English Dialect Dictionary,' about half finished; Bradley's 'Middle English Dictionary,' 1891; Taylor's 'Words and Places,' several revisions, and Blackie's 'Dictionary of Place-Names,' both etymologies of names; Bartlett's 'Dictionary of Americanisms' (1877), much too inclusive, and Farmer's 'Americanisms, Old and New' (1889); Roget's 'Thesaurus' of synonyms, last edition 1892.

Dictys (dĭk'tĭs) **of Crete,** a follower of Idomeneus in the Trojan war, whose name is attached to a professed journal of the leading events of the contest, which has come down to us in Latin prose, under the title 'Ephemeris Belli Trojani.' An introduction relates how the narrative, inscribed in Phœnician characters on bark-paper, was found in a coffer of tin in Dictys' tomb, which had been burst open by an earthquake in the reign of Nero, and how the emperor caused it to be translated into Greek; this is accompanied by a letter from one Quintus Septimius, who claims to have prepared the condensed Latin version that follows. This dates probably from the 4th century A.D., and though of no intrinsic value, was a chief source of the romances of the Middle Ages. The best editions are those of Dederich (Bonn 1832 and 1837), and Meister (Leipsic 1872).

Dicye'midæ, a family of very lowly multicellular organisms, parasitic in habit. They are found in cuttle-fishes, while related organisms known as *Orthonectida* occur in a brittle-star and in a nemertean worm. The largest species of the genus *Dicyema* measures five sevenths mm.; the smallest is 10 times less. These organisms hardly rise above the level of the embryonic gastrula, and some seem hardly to attain it, but it is still uncertain how much of this simplicity is primitive, and how much the result of degeneration.

Dicyn'odon, a genus of fossil reptiles occurring in a sandstone, supposed to be of Triassic age, in southern Africa and India. The principal remains yet found, the bones of the head, indicate a gigantic type between the lizards and turtles. The anterior portions of the jaws appear to have been altogether toothless, and they form a kind of beak, which was probably sheathed in horn. The lower jaw has no teeth; but each superior maxilla carries an enormous tusk-like tooth, growing from a persistent pulp. Eye orbits very large, cranium flat, with nostrils divided as in lizards. Order, *Anomodontia.*

Didactic Poetry (from Gr. διδακτικός, pertaining to teaching), has as its object the instruction of the ignorant. In the early ages of Greek literature there was no prose writing. Hesiod taught husbandry and theology in verse, Solon harangued in hexameters. Ever since that time verse has to some extent been used as a vehicle of teaching. The early Ionian philosophers, like Xenophanes, expounded their system in poetry, and, in the later days of the Roman republic, Lucretius, in the finest didactic poem that was ever written, unfolded the theories of Epicurean materialism. Virgil wrote the 'Georgics' to teach the veterans of Augustus the art of agriculture, and Horace in his 'Art of Poetry' embodied for young Roman poets the Greek principles of dramatic writing, while Ovid set forth systematically the 'Art of Love.' Vida, the Italian, Boileau, the Frenchman, Pope, the Englishman, also wrote in verse an 'Art of Poetry.' English poets have been much inclined to didactic poetry. Darwin's 'Botanical Garden' is a treatise on the Linnæan systems of botany. The longer poems of Cowper are moral lectures. Dyer's 'Fleece' is the shepherd's guide, and even the 'Shipwreck of Falconer' may be looked upon as a manual of seamanship.

Didel'phia, a group of mammals comprising the Marsupials (q.v.), so called in reference to the double condition of the generative organs, in the female. Compare Monodelphia, and see Metatheria.

Diderot, Denis, dē nē dēd-rō, French philosopher: b. Langres 5 Oct. 1713; d. Paris 31 July 1784. 'Philosophic Reflections' — burned by the hangman and therefore widely circulated — and 'A Skeptic's Walk' (1747), were part of a warfare against the Church. In the compilation of the 'Encyclopédie' Diderot bore the main burden. He wrote all the articles on technology and industries, besides many of those on points of philosophy, and even on physics and chemistry. Further proof of his versatility is seen in the admirable reports he wrote (1765–7) of the art expositions at the Paris Academy. He wrote some dramas, but none of them possess any great merit. On the other hand, his novel, 'The Nun,' and his dramatic dialogue, 'Rameau's Nephew,' are wonderfully effective pictures of the corrupt society of the time. His little sketches, 'Little Papers,' are pearls of kindly humor and of witty narrative.

Diderot and the Encyclopedists, a literary study by John Morley, published 1890. This examination of the life, the work, and the influence of "the most encyclopædic head that ever existed" (as Grimm termed Diderot), and his fellow-workers, is an admirable monograph. Of all the literary preparation for the French Revolution the 'Encyclopédie' was the symbol; it spread through the world a set of ideas that entered into vigorous conflict with the ancient scheme of authority. Diderot, as the head of the movement, D'Alembert his coadjutor, Voltaire, J. J. Rousseau, Buffon, Helvetius, Holbach, Raynal, etc., with other famous persons of the day, as Goethe, Garrick, the Empress Catharine II.,— are here vividly depicted, with wide knowledge of books and of life, great skill in reading character, facility in disentangling causes and results, and broad philosophical perception of the historic position of the age. Anglo-Saxon readers find this work less one-sided than Taine's on the same subject. Appended to the book is a translation of the greater part of 'Rameau's Nephew,' Diderot's famous dialogue.

Didier, Desiderius, dē-dē-ā, or the last king of the Lombards. He was Duke of Istria, and happening to be in Tuscany in 756, when Astolphus, the previous king, died childless, immediately raised an army and laid claim to the throne. Didier was crowned and seemed to

have secured the permanence of his dynasty by marrying his daughter to Charlemagne in 770. The marriage, however, proved unfortunate; and when Charlemagne dissolved it by repudiation, the quarrel between the families became irreconcilable. Didier afterward invaded the Papal States, and made a conquest of a part of them, when Charlemagne interfered. Didier, unable to oppose him, shut himself up in Pavia, when, after a siege of a year, he was obliged to surrender at discretion.

Didier, Charles, shärl, French poet and novelist: b. Geneva 1805; d. Paris 8 March 1864. He wrote some novels designed to awaken patriotic sentiment in Italy, and to make known the struggles of the Carbonari and other revolutionists against Austrian and papal dominion. Among these were: 'Underground Rome' (1833); 'The Roman Campagna' (1842); and 'Fifty Years in the Wilderness' (1857). His lyric poems, 'Melodies' (1827), are characterized less by force than by sweetness.

Didier, Eugene Lemoine, American author: b. Baltimore, Md., 22 Dec. 1838. He edited a weekly paper called 'Southern Society' 1867–9. Among his published works are: 'A Life of Poe' (1876); 'Life and Letters of Madame Bonaparte' (1879); 'Primer of Criticism' (1883); 'The Political Adventures of James G. Blaine.'

Didier, Jules, zhül, French painter: b. Paris 26 May 1831. He studied under Cogniet and Laurens, and won the prix de Rome in 1857. Among his works are: 'Farm on the Ruins of Ostia'; 'Normandy Landscape'; 'Hunting a Hare'; 'Morning on the Borders of the Wood'; 'Agriculture'; 'Ford near Autun'; and 'Return of the Drove.'

Did'ius Sal'vius Julia'nus, Mar'cus, Roman emperor: b. about 133 A.D.; d. Rome 1 June 193 A.D. Having filled the offices of quæstor, ædile, and prætor, he was appointed commander of a legion in Germany, and subsequently governor of Belgica. Having distinguished himself in Africa and Asia Minor, he returned to Rome, and, on the assassination of Pertinax, made himself emperor by bribing the prætorian guards. He now assumed the name of Marcus Didius Commodus Severus Julianus; but, after a short reign of two months was killed in his palace by a common soldier.

Di'do, queen of Carthage. She was the daughter of Agenor (Belus); according to others, of Carchedon of Tyre, from whom Carthage received its name; others call her father Mutgo or Muttinus. Her brother was Pygmalion, king of Tyre. Her father married her to her uncle Acerbas, otherwise called Sichæus or Sicharbas. He was murdered before the altar by her brother, who was instigated by the desire of making himself master of his wealth. She therefore set sail for Africa, with all her wealth and her faithful companions. They landed on the coast of Africa, not far from Utica, a Tyrian colony. She purchased as much land as might be covered with the hide of a bull, which she cut into the thinnest possible strips, and surrounded with it a large extent of territory. Here she first built the citadel of Byrsa, and afterward Carthage. Hiarbas, a neighboring prince, paid his addresses to her. Unwilling to accept and unable to refuse the proposal, she sacrificed her life on the funeral pile. By an anachronism common with poets, Virgil attributes her death to the faithlessness of Æneas. Dido was worshipped in Carthage as a goddess.

Didon, dē'dōṅ', J. Henri, Père, French Dominican preacher and writer: b. 17 March 1840; d. 1900. He has attracted much attention for his series of eloquent Lenten sermons. Having come into conflict with his superiors because of his views about democracy, he ceased for a time to preach. His leisure was spent in preparing a life of Jesus, which should be an antidote to the skeptical 'Vie de Jesus' of Renan. This was published in 1891 under the title, 'Jésus Christ,' a book which made a great impression throughout France. He has also written 'Les Allemands' (1884).

Didonceph'alus, a monster with a double range of teeth, or a double jaw.

Didot, Ambroise Firmin, äṅ-brwäz fēr-măṅ dē-dō, French publisher: b. Paris 7 Dec. 1790; d. there 22 Feb. 1876. He was a son of Firmin Didot (q.v.) and with his brother Hyacinthe published such important works as 'L'Univers pittoresque'; 'Nouvelle biographie générale,' etc.

Didot, Firmin, French publisher, printer and type-founder: b. Paris 14 April 1764; d. 24 April 1836. He was a brother of Pierre Didot (q.v.). He was inventor of a new sort of script, and an improver of stereotype printing.

Didot, Francois, frän-swä, French printer: b. Paris 1689; d. 2 Nov. 1757. He founded the famous firm of Didot in Paris in 1713.

Didot, Francois Ambrose, fräṅ-swä äṅ-brōz, French printer: b. Paris 7 Jan. 1730; d. 10 July 1804. He was a son of François Didot (q.v.), and invented many of the machines and instruments now commonly used in the typographic art. From his foundry came the most beautiful types that, up to that period, had been used in France, and he was the first person in France who printed on vellum paper. He took the greatest care to have his editions correct. By the direction of Louis XVI. he printed a collection of the French classics for the use of the dauphin. The Count d'Artois employed him to print a similar collection.

Didot, Henri, ōṅ-rē, French type-founder: b. 1765; d. 1852. He was a son of P. F. Didot (q.v.), and early distinguished himself as a type-engraver. He then applied himself particularly to improve the method of founding types, in which he succeeded by the invention of a new founding apparatus. He called his process "fonderie polyamatype." It is more expeditious than the former mode, and the types are much cheaper.

Didot, Hyacinthe Firmin, ē-ä-săṅt fēr-măṅ, French publisher: b. Paris 11 March 1794; d. Dandon, France, 7 Aug. 1880. He was a son of Firmin Didot (q.v.), and with his brother, A. F. Didot, conducted the business of the house of Didot from 1827.

Didot, Pierre, pē-ār, French publisher and printer: b. 25 Jan. 1761; d. 31 Dec. 1853. He was a son of François Ambrose Didot (q.v.), and succeeded his father in the printing business in

1780. In the universal impulse which the arts received from the revolution he aimed at becoming the Bodoni of France, and conceived the plan of a splendid edition of the classic authors in folio, which should excel, if possible, the best editions extant. He spared no expense to adorn them with all the splendor and elegance of the arts of design, and even sacrificed a part of his property to this favorite object. His 'Virgil' (1798) was worthy of these endeavors, and still more so his 'Racine' of 1801, which the French regard as the first typographical production of any age or country. Only 250 copies of these works were struck off. Among the productions of his press, Visconti's 'Iconographie' is particularly distinguished. Didot devoted the efforts of 10 years to the improvement of the types, and caused 18 different sorts, with new proportions, to be cut, with which he printed Boileau and the 'Henriade' in 1819. Didot paid no less attention to correctness and purity of text, and perfect consistency of orthography, than to typographical beauty.

Didot, Pierre-François, pē ār frän-swä, French printer: b. Paris 9 July 1732; d. 7 Dec. 1795. He was a son of François Didot (q.v.), and distinguished himself by his bibliographical knowledge. He also became printer to Louis XVIII. He had a great share in the changes made in the character of types, and contributed to the advancement of his art. He published some very fine editions; among them the 'Voyages d'Anacharsis.'

Didron, dē'drōn', **Adolphe Napoleon,** French archæologist: b. Hautvilliers, Marne, 13 March 1806; d. 13 Nov. 1867. He began in 1844 to publish 'Annales Archéologiques,' devoted to mediæval art and antiquities, which he continued to 27 volumes. This work was completed, long after his death, by the 28th volume, which included a general index. It is a valuable storehouse of mediæval art and archæology. His chief works are a 'Manual of Christian Iconography,' translated from an ancient manuscript, and 'Christian Iconography' (1843), which forms a history of the representations of the persons of the Trinity in art, their attributes, etc.

Didun'culus, a genus of birds allied to the pigeons, and comprising only the one species, *D. strigirostris* of the Navigator Islands. This bird is of special interest as being the nearest living ally of the extinct dodo. It has a length of about 14 inches, with a glossy plumage verging from a velvety black on the back to greenish black on the head, breast, and abdomen. The large beak, which is nearly as long as the head, is greatly arched on the upper half, while the lower is furnished with two or three tooth-like indentations.

Didymæus, dĭd-ĭ-mē'ŭs, a surname of Apollo, either because he was the twin-brother of Diana, or from the double light of the sun and moon, which he lends to men. Under this name Apollo had one of the most famous of his temples and an oracle at Didyma among the Milesians. Pindar calls Diana Didyma.

Didym'ium (Greek, "twin"), a supposed metallic element, isolated from the mineral cerite by Mosander in 1842. The symbol D or Di was assigned to it, and its atomic weight was considered to be about 143. The name referred to the close resemblance between the new metal and the element lanthanum, which had been discovered by the same chemist, and in the same mineral, a short time before. Recent researches have shown that didymium is not an elementary body, but that it consists principally of two other elements, which are respectively known as neodymium and praseodymium (q.v.). This discovery renders the name "didymium" singularly appropriate for the original substance.

Did'ymus, Alexandrian grammarian and critic: b. 63 B.C. He was a prolific writer, being celebrated for a treatise on harmony. The difference between major and minor whole tone, recognized by him, is known to this day as "the comma of Didymus," and some modern composers have written in his system. He belonged to the school of Aristarchus, and was contemporaneous with Cicero. By Seneca his works were estimated at 4,000, none now extant.

Die (*Dea Vocontiorum*), the capital of an arrondissement in the department of Drôme, France, is situated on the right bank of the Drôme, at the foot of Mount Glandaz, in a wide and fertile plain. The manufactures are woolen cloth, paper, leather, and silk; there is some trade in cattle and wood, and the neighborhood produces excellent fruit, and the white wine called "Clairette de Die." The town was formerly the seat of a bishop, and previous to the revocation of the Edict of Nantes in 1685, of a Calvinistic university. Among the interesting structures of Die are the old cathedral, with granite columns from an ancient temple of Cybele, and a porch of the 11th century; the episcopal palace, the walls flanked by towers, and the ruins of a castle — all of considerable age, the triumphal arch on the road toward Gap, known as the Porte St. Marcel, portions of an aqueduct, and other Roman remains. There are several mineral springs in the vicinity.

Diebitsch-Sabalkanski, Hans Karl (häns kärl dyī-bēch-zä-bäl-kän-skē) **Friedrich Anton,** COUNT, Russian field-marshal: b. Grossleippe, Silesia, 13 May 1785; d. Kleczwo, near Poltosk, Poland, 10 June 1831. In 1707, when 12 years of age, he was sent by his father, who had served under Frederick the Great and Frederick William II. of Prussia, to the military school of Berlin, but in 1801 he quitted the Prussian service for that of Russia, entering the ranks of the imperial guard. He served with distinction in the battles of Austerlitz, in 1805; Eylau and Friedland in 1807, and, having attained the rank of captain, for five years subsequent to the treaty of Tilsit, devoted himself to the study of military science. During the invasion of the French in 1812, he served under Wittgenstein, compelled the capitulation of the Prussian general, York, became chief of staff in 1813, took part in the battle of Lützen, and later joined the corps of Barclay de Tolly in Silesia, as quartermaster-general. In June 1813 he was instrumental in bringing about the secret treaty of Reichenbach, between England, Austria, Russia, and Prussia. He fought in the battles of Dresden and Leipsic, and for his services was made lieutenant-general, at the age of 28, by Alexander. He was responsible for the march

on Paris, in the French campaign of 1814, which terminated the war, and for this he was decorated with the order of Alexander Nevskoi. He took command of the first corps upon Napoleon's return from Elba, but was later appointed adjutant to the emperor, and, having been made chief of staff, accompanied him on his journey through southern Russia, till his death at Taganrog, in 1825. Diebitsch thereupon returned to Saint Petersburg, and by his intrepid conduct during the revolution of 25 December, won for himself the title of baron, and later Emperor Nicholas created him count. He had the chief command in the Turkish war of 1828–9; stormed Varna; and made the famous passage of the Balkans, compelling the Porte to conclude the peace of Adrianople, for which the surname of Sabalkanski (Transbalkanian), was conferred upon him, and he was raised to the rank of field-marshal. He was appointed commander-in-chief of the army sent to put down the rebellion which had broken out in Warsaw, 29 Nov. 1830, and was also made governor of the provinces adjoining Poland. In this campaign he did not meet with success, suffering defeats at Wisniew and Stoczek, 11 Feb. 1831; at Dobre, on the 18th; at Grochow and Wawer on the 19th, and in the series of engagements fought near Praga, in March. He was, however, more successful in the bloody battles of Nur, Lornza, and Ostrolenka, fought from 15–26 May, but after establishing his camp at Kleczwo, was taken sick with cholera, and died shortly afterward.

Diedenhofen, dē-dĕn-hōf'ĕn. See THIONVILLE.

Diefenbach, Lorenz, lō'rĕnts dēf ĕn bäH, German philologist: b. Ostheim, Hesse, 29 July 1806; d. Frankfort-on-Main 28 March 1883. He was 12 years pastor and librarian at Solms-Laubach. In 1848 he settled at Frankfort-on-Main, where in 1865 he was appointed second librarian to the city. His literary industry was enormous, embracing poetry and romances, as well as those more ponderous works by which his name will live. His greatest books are: 'Celtica' (1839–40); 'Vergleichendes Wörterbuch der Gothischen Sprache' (1846–51); 'Glossarium Latino-Germanicum mediæ et infimæ ætatis,' a supplement to Ducange's well-known 'Glossary' (1857); 'Origines Europææ'; 'Hoch- und Niederdeutsches Wörterbuch' (with Wülcker, 2 vols, 1874–5).

Dieffenbach, Johann Friedrich, yō hän frēd'rĭH dēf'fĕn-bäH, German surgeon: b. Königsberg 1 Feb. 1794; d. Berlin 11 Nov. 1847. He was educated in theology, but from 1813–5 served as a volunteer in the war against Napoleon. Upon his return he devoted himself to the study of medicine, taking his degree at Würzburg in 1822. He soon became widely known as an operator; in 1830 became head surgeon in a Berlin hospital; in 1832 became a professor in the university; and in 1840 director of clinical surgery. He was distinguished as an operator, especially in the art of forming by transplantation new noses and lips. He wrote: 'Die Transfusion des Blutes und die Einspritzung der Arzneien in die Adern' (1828); 'Chirurgische Erfahrungen' (4 vols., 1829–35); 'Durchschneidung der Sehnen und Muskeln' (1841); 'Ueber das Schielen' (1842); 'Operative Chirurgie' (1844–48); etc.

Dieffenbachia, dēf-fĕn-bäk'ĭ-a, a genus of *Araceæ* (arum family), of which there are about 15 species, found in the woods of South America and the West Indies. Their leaves have sheathing petioles, and are often variegated. Their form of inflorescence is the spathe-enclosed spadix characteristic of the order, the spathe in *Dieffenbachia* being green or yellowish. The best-known species is the dumb cane of the West Indies (*D. seguina*).

Diego Garcia, dē-ā'gō gär-thē'ä, an island of the Indian Ocean, in lat. 7° S., and lon. 72° to 73° E., extends in an irregular horseshoe shape, and is 30 miles long, embracing between its extremities three minor islets (the Chagos Islands). It contains a spacious bay, and is very convenient for coaling purposes. The group has about 700 inhabitants, and is a dependency of Mauritius.

Diégo Suarez, swä-räs, a town and territory, owned by France, in the extreme north of Madagascar, on the east coast, a little south of Cape Amber. Pop. 5,000.

Dielec'tric, a name applied by Faraday to any medium through or across which electrostatic induction can take place. (See INDUCTION, ELECTROSTATIC.) Solids, liquids, and gases possess this property of transmission, though in differing degrees, and their dielectric value, or specific inductive capacity, is measured by the ratio of the capacity of a condenser in which each may form the insulator, to the capacity of the same condenser with a vacuum as insulator.

Diel'man, Frederick, American painter: b. Hanover, Germany, 25 Dec. 1847. He removed to the United States in childhood, and was graduated at Calvert College. He was a topographer and draughtsman in the United States Engineer Department 1866–72; studied art under Diaz at Munich, and established a studio in New York in 1876. He was the designer of the mosaic panels, 'Law' and 'History' in the new Congressional Library at Washington, D. C.; and was president of the National Academy of Design in 1900.

Diëlytra, dī-ĕl'ĭ-tra, a genus of plants belonging to the natural order *Fumariaceæ* or fumitories. The best-known in this country is the *D. spectabilis*, a native of northern China and the neighboring parts of Siberia, which was discovered in 1810, and is now everywhere common in Europe as a garden plant. It blossoms in April and May, and its long drooping racemes of purplish-red blossoms present a very graceful appearance. It grows freely in the open air, and only requires the protection of glass in the winter. It prefers a sunny position and a light but fertile soil, and may be propagated by division of the root. In Germany it receives the popular name of pendant heart or virgin's heart, from the shape of the blossoms.

Diepenbeeck, dē'pĕn-bäH, Abraham van, Flemish painter: b. Bois le Duc 9 May 1596; d. Antwerp 1675. He first studied glass painting, and a number of windows in different churches in Antwerp are his work. Later he studied under Rubens. Among his paintings are: 'St. Norbert'; 'Ecstasy of St. Bonaventura'; 'St. Francis Adoring the Sacrament'; 'Entombment of Christ'; 'Neptune and Amphitrite'; and the 'Flight of Clœlia.'

Dieppe, dē-ep', France, seaport, in the department of Seine Inferieure, 93 miles northwest of Paris. The harbor accommodation is extensive, there being an outer harbor and four or five inner basins or docks, and the depth of water is sufficient for vessels of considerable burden; but the entry to it is somewhat difficult. The manufactures include works in ivory, the most famed in Europe; works in horn and bone, lace-making, sugar-refining, and ship-building. Pop. 21,091.

Dies and Die Making. Dies and punches for press work may be divided into five different classes, viz: Blanking dies for cutting out blanks; bending dies for wire or sheet metal; drawing dies for drawing up tubes or shells; embossing or coining dies for coins or jewelry work; forging dies for drop forgings.

BLANKING DIES.

Blanking dies consist of a male die or punch and a lower or female die. They are made in almost every form and shape for cutting out flat blanks from steel, iron, paper, etc. Usually both punch and die are hardened and tempered; sometimes the punch is left soft, and as it gets worn is set out and refitted by being forced or shoved into the die; sometimes it is best to reverse this operation, as in punching paper, playing cards, etc., and harden the punch and leave the die soft.

Shear.—A shear is usually given to the punch or die, determined by the work it has to do; when it is intended to use the blanks, or pieces punched out, the shear should be given to the die, as less distortion is given to the metal by this method, but where the hole is the object sought, as in rivet holes in boiler plates, etc., the shear should be given to the punch.

Die-shoes.— Cutting or blanking dies are usually held in a shoe or die holder, or if a large die, it is fastened to the bed of the press direct, but as a rule the fewer pieces intervening between the press and the die the better results will be obtained. Very large blanking dies are usually made in one of two ways; either as rings set in a cast-iron holder, or by welding the rings directly on to a wrought-iron holder or die-plate; the latter method is the best in making plain dies, but cannot be used in compound dies. The welding of the steel rings together, and then on to the wrought-iron plate, calls for good work on the part of the smith. In the former method the rings are first welded and then turned, hardened and ground true in the universal grinder, then set in a groove turned in the holder and held there by being bolted from the back of the holder.

Hot Work.— In making dies for hot work (as the blanking out of nuts and other thick work from red-hot metal) a die made of chilled cast-iron with a good clearance will give good results, as the temper is not affected by the heat of the stock punched, the punch being made of steel and fitting the die loosely (in very thick stock a difference of 1/16″ or more in the diameter of the punch and die is not too much), and if a nice job is wanted, the work can be shaved, or repunched, as it is called, by forcing it through a second die that is a trifle smaller than the first, leaving a true and smooth surface.

Repunching.— In the repunching of brass and copper, the use of buttermilk as a lubricant will give a better result than any oil or soap water that we have yet found. Dies for repunching or finishing work are not in general use to the extent that they would be if the saving that could be effected by this method were well known. Many jobs now performed on the milling machine could be repunched, and better results obtained at less cost than by the former method.

Power.— The power required to blank out a piece of metal depends largely on the shape of the blank and the number of cutting inches in the die; a long narrow blank requiring more power than a round blank of the same area, the shear of the dies being equal. If the work will admit of the face of the punch being slightly rounding, less pressure will be required than with a flat-ended punch.

The first thing to be considered to determine whether a punch and die should be used to produce work is the number of pieces wanted. If it is standard work, and the demand is 100 or more per week, it is both desirable and economical to have a die made, for after the die is once made the work can be produced at a very low cost. Oftentimes when a large number of pieces are wanted, and a power feed is used, the cost will not exceed two cents per 1,000 blanks.

BENDING DIES.

Bending dies are used for forming sheet metal or wire into almost any form that may be wanted. The die shown (Fig. 1) is for bending the piece on the right-hand side of the punch. This is blanked out by a previous operation placed in the die by hand, and is bent as shown by the finished piece on the left-hand side, which does not show it so clearly as it should. The two sides of the blank are bent down and the long one on the right is curved around the punch shown and the ring on the end is twisted around to a right angle to the rest of the arm.

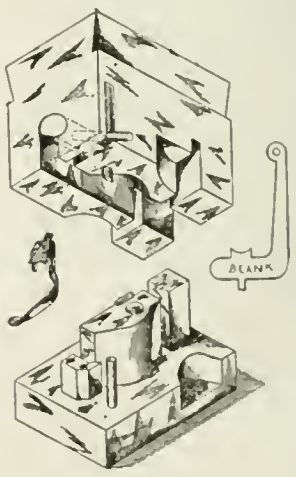


Fig. 1.

The Punch.— The punch is made from a single block of steel which is planed up to fit the press, and then machined out as shown in the cut. The twister, which is for turning the ring at right angles to the rest of the arm, is counter-bored in and held in place by the quar-

ter-inch pin driven into the side, and which is held up by the spiral spring seen at the upper right-hand corner of the sketch. The die is self-contained and is used in an ordinary single-stroke press, and requires no extra attachments to enable it to do the work. This same principle can be used in many cases, and the bending performed in one operation which would otherwise require two or more strokes of the press.

DRAWING DIES.

Drawing dies are used for shaping or drawing up sheet metal. The use of dies of this class is of comparatively recent origin; it having been first put into practical use by one De Vere of France in the latter part of the 18th century, and in the year 1827 the same process was patented for the drawing up of cartridge shells.

Origin.— In 1860 or 1861, two Frenchmen came to this country, bringing with them drawings of a model of a drawing press. These they had surreptitiously taken from a press upon which they had been employed in France. This press was secreted in a barn near the city of Wilmington, Del., and was finally perfected and put into actual use by Henry Marchand, who formed a company for the manufacture of the same, known as the Higgins & Marchand Co. The first press was set up in one corner of the shop which was boarded up, and only three men allowed in the room. The first piece drawn up was a washbasin made from a 14″ blank, which was probably the first piece of drawn work ever made in America.

Drawing dies may be divided into three kinds: the plain drawing or "push through" dies; solid bottom or "knock-out" where the work is to be knocked back; and combination dies which cut and draw at one stroke of the press. Combination dies are often so arranged as to perform three, four and sometimes more operations on the work at one stroke of the press. Dies of this nature are very expensive, and are only desirable when the work is to be done in large quantities.

Push Through Die.— Fig. 2 shows a plain "push through" drawing punch and die, the

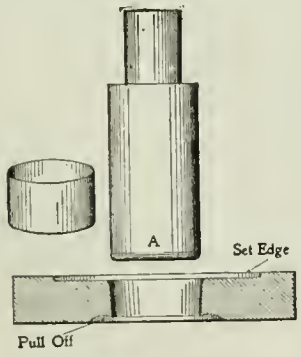

Fig. 2.

blank being punched out to fit the set edge, and then "drawn up" or rather, it is pushed through the die by the punch, and as the punch rises, the work is stripped from the punch by the "pull off" which is made very sharp for the purpose. A "draw" of about one-quarter to one-half of a degree is given the die, making it that much larger on the upper side or face, and the upper edge is rounded over and left very smooth and as hard as fire and water will make it. "Don't draw a drawing die." The lower end of the punch is rounded and left in the same shape; often the die will work better if the finish is changed from a circular to a lateral polish. The diameter of the punch is equal to that of the die, minus double the thickness of the stock to be drawn. A die of this kind can only be used on shallow work, or in redrawing or reducing the diameter of the work that has been previously drawn up; if used on deep drawing it will pucker or crimp around the edge. To avoid this there must be a blank holder to hold the stock firmly while it is being drawn.

Single Action.— Fig. 3 shows a single-action cutting and drawing die, better known as a

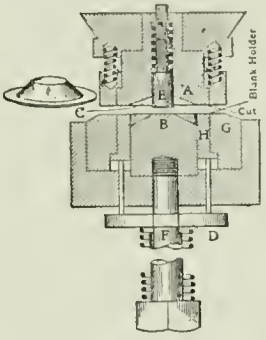

Fig. 3.

single-action combination die. A combination die is, as the name indicates, a combination of a drawing die and cutting die in one; it punches the blank, and at the same stroke of the press, draws it up into a cup or shell. The die shown is intended to be used in an ordinary single-stroke power press, and will draw up work not over one or two inches deep.

Double Action.—A double-action die is a modification of a single-action die, to be used in a double-stroke press; it can be used on work that is too deep for single-action dies The one shown in Fig. 4 is known as a "push through" die. It is somewhat like the

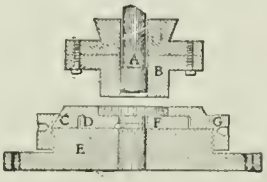

Fig. 4.

single-action die, except that the shell is cut by the punch (B) and is carried to the drawing die (D) and the lower surface of the die acting as a blank holder is held there while the drawing punch (A) forces it through the drawing die, and as the punch withdraws, the shell is removed by the lower edge of the die, which is ground very sharp for that purpose, and is known as the "pull off." The

drawing dies held in place by the cutting die being clamped upon it by the ring (G).

This style of die has this advantage; the cutting and drawing dies are independent of each other, and can be changed for a longer or shorter shell, or either die can be repaired or replaced without changing the other.

Triple Action.— Triple-action dies are intended to punch, draw and stamp the work at the same stroke of the press. The construction is the same as the double-action, except that the die block is cut away to allow the stamping die to be set in place, and the shell is carried down to the stamping die and "struck up" between that and the matrix formed on the end of the drawing punch; as the punch rises, the work is stripped from the punch by the "pull off," and is removed from the dies by the use of an inclined press, or by a swinging arm attached to, and operated by the press, that catches the work as it falls from the punch.

This style of die is largely used on blacking box covers, lard pail lids, or other work where a stamped or embossed cover is wanted. A die of this class should always be used in an arched press, as the strain of the stamping process is very severe on the "open back" style press, and is apt to crack the body of the press. In making a drawing die, use a steel that is high in carbon, and if it shrinks a little in hardening so much the better. There is on the market at least one grade of steel which will stand three successive hardenings, and will shrink each time so that the die as it wears out can be "shrunk up" and then ground out to size again.

Various modifications of a drawing die are necessary in order to successfully draw up the different metals. Zinc works better when the soap suds, or whatever lubricant may be employed, is used hot as possible, as that metal works much better at a heat of 125 degrees.

Buttermilk.— In drawing up very delicate work where the nature of the metal is such that the die is inclined to clog, or as the press hand calls it "copper up," the use of buttermilk will be found very effective.

Thick Work.— In drawing very thick work the drawing die can be made bell-mouthed, as the thickness of the metal will reduce the tendency to crimp or pucker. The same method of making the die is followed when it is desired to draw a shell that is very short in proportion to its diameter.

The possibilities of what can be done by this method of forming up sheet metal are almost unlimited, and the press of the future, as shown by the frontispiece, is not an exaggeration of what will be performed at no distant day, as trunks, wheelbarrows, sinks, and the copper boiler for hot-water service are every-day productions at the present time

Metal.— The great secret of drawing up work is to have good metal, and to properly adjust the blank holder, so as to hold the metal just hard enough to prevent it from puckering. In drawing up metal, always keep one thing in mind, that is, that metal has some of the properties of water, and it will flow where it can go the easiest. A grade of steel which will harden good, a little knowledge of toolmaking, and a good deal of experience are what is needed to make a good drawing die.

EMBOSSING OR COINING DIES.

Embossing or coining dies for coins or jewelry work are used for striking up coins, medals, emblems, or other work that has to show the imprint and the figures which are cut in the die. In the case of dies used for coin work, both the upper and lower die are embossed or engraved with the design or letter work that it is desired to have stamped on the coin; the blank being fed on to the lower die, which is surrounded by a knurled ring, and as the upper die or punch descends, the metal is confined and kept from spreading by the ring.

Dies used for coining are the oldest example of die work that we have any knowledge of, as there are in existence a number of coins which were "struck up" over two thousand years ago; showing plainly that the art of die sinking was known at that period, but the fact that they were left untrimmed or rough, on the edges, indicates that the process of punching by means of a close-fitting punch and die was not known at that time. Dies for coining could have been used in a press of very rude construction, the main requisite being that sufficient power was employed on the upper die or punch, to leave the desired impression upon the coin. This may have been done by the use of an ordinary maul or sledge, the upper die being held by hand. Coining dies are the highest example of the die-sinker's art. There are several men whose proficiency in this line is very great, and who draw salaries of from $5,000 upwards for their proficiency in this line of work.

Embossing Dies for Jewelry Work.— In jewelry dies the impression is usually cut or "hubbed" into the lower die, and the male die or "force" as it is called, being used to drive the metal into the lines drawn or cut, so as to bring up the desired design. Dies of this class are used to produce almost every known form of jewelry work. The back of a watch or locket, perhaps, being an example of this class of work we are all familiar with. Spoons, knives, and forks, and in fact almost every article of tableware are also formed up by the above method.

Hydraulic Dies.— Embossing is often done on very large pieces of work, especially on what is known as hollow-ware, such as ice-pitchers, etc., the blank being placed in the die, which is sectional and then put into the press. The blank is filled with water or sometimes a special composition of wax, which is then subjected to a very heavy pressure, forcing the pitcher or other work into the desired shape, and also into the lines which are sunk or cut in the dies.

FORGING DIES.

The use of dies for drop-forging of metal is of recent date, and was first used in gun work. The hammer of a rifle being one of the first pieces of work ever made in that manner. It consists of cutting a fac-simile of the forging desired, either in the lower die, or sometimes it is divided equally into the upper and lower die, and then the metal,

either iron, steel, or copper, is heated and "squashed" into the impression sunk in the dies. This method of producing work is rapidly increasing from the fact that the quality of the work is far better and the cost of production much lower than any other method of manufacture.

Flash.— The forging operation flings out a fin or "flash" as it is known, caused by the amount of metal being used in excess of what the dies will hold. This is either "hot" trimmed as soon as removed from the dies, or the work is allowed to cool and then "cold" trimmed; the latter work being done in an ordinary power press.

J. L. Lucas,
Consulting Expert on Dies and Press Tools; Author of 'Dies and Die-Making.'

Dies Fasti et Nefasti, dī'ēz făs'tī ĕt nē-făs'tī, a Roman division of days, with reference to judicial business, into working-days and holidays. *Dies fastus* was a day on which courts could be held and judgments pronounced; *dies nefastus*, a day on which courts could not be held nor judgments pronounced.

Dies Iræ, dī'ēz ī'rē, the first two words used as the title of a celebrated Latin hymn on the Last Judgment. This incomparable hymn consists of 17 stanzas, with an 18th of 4 lines, and is based on the prophetic passage, Zephaniah, i. 14–18. It is probably the work of the Franciscan, Thomas de Celano, who died about 1255. The sublimity and force of its thoughts are well matched by the impressive solemnity of the verse, its stanzas of three lines, each with the same double rhyme, making the inmost soul tremble, "as with three blows of a hammer," says Guericke. It is said to have first appeared in the missals made at Venice about 1250, and is one of the five 'Sequences' that have been universally used in the Roman Catholic Church since the Council of Trent. Its place is in the *Missa in commemoratione omnium fidelium defunctorum.* The Tridentine text, published in 1567, is somewhat different from that in the old missals, and another and considerably inferior version appears on a marble tablet of unknown date, in a Franciscan church at Mantua. The *Dies Iræ* has been the subject of musical compositions by Palestrina, Haydn, Cherubini, and Mozart, and no religious poem has been more frequently translated. There are English translations by Crashaw, Macaulay, Lord Lindsay, Isaac Williams, and Gen. John A. Dix. The opening stanzas are paraphrased in the 'Lay of the Last Minstrel,' canto vi. Goethe has felicitously introduced a few stanzas into his 'Faust,' and, in his novel 'Ferragus,' Balzac has given a thrilling description of its effect, when sung at a funeral or requiem mass. The following is the full text:

Dies iræ, dies illa,
Solvet sæclum in favilla,
Teste David cum Sibylla.

Quantus tremor est futurus,
Quando Judex est venturus,
Cuncta stricte discussurus!

Tuba mirum spargens sonum
Per sepulchra regionum,
Coget omnes ante thronum.

Mors stupebit, et natura,
Cum resurget creatura,
Judicanti responsura.

Liber scriptus proferetur,
In quo totum continetur,
Unde mundus judicetur.

Judex ergo cum sedebit,
Quidquid latet apparebit,
Nil inultum remanebit.

Quid sum miser tunc dicturus,
Quem patronum rogaturus,
Cum vix justus sit securus?

Rex tremendæ majestatis,
Qui salvandos salvas gratis,
Salva me, fons pietatis.

Recordare, Jesu pie,
Quod sum causa tuæ viæ,
Ne me perdas illa die.

Quærens me sedisti lassus,
Redemisti crucem passus,
Tantus labor non sit cassus.

Juste judex ultionis,
Donum fac remissionis,
Ante diem rationis.

Ingemisco tanquam reus,
Culpa rubet voltus meus
Supplicanti parce, Deus.

Qui Mariam absolvisti
Et latronem exaudisti
Mihi quoque spem dedisti.

Preces meæ non sunt dignæ
Sed tu bone, fac benigne,
Ne perenni cremer igne.

Inter oves locum præsta,
Et ab hædis me sequestra,
Statuens in parte dextra.

Confutatis maledictis,
Flammis acribus addictis,
Voca me cum benedictis.

Oro supplex, et acclinis,
Cor contritum quasi cinis,
Gere curam mei finis.

Lacrymosa dies illa
Qua resurget ex favilla,
Judicandus homo reus;
Huic ergo parce Deus.

Amen.

Dieskau, Ludwig August, lood'vĭg ow'-goost dēs'kow, German general in French service: b. 1701; d. Surenne, near Paris, 8 Sept. 1767. He was adjutant of Marshal Saxe, whom he accompanied in the campaigns against the Netherlands, and became in 1748 brigadier-general of infantry, and commander of Brest. In 1755 he sailed as field marshal to Canada, at the head of French troops, to assist in the campaign against the English. He ascended Lake Champlain with the design of attacking Fort Edward, defeated a detachment sent for its relief, and pursued them to the fort with the hope of entering it with them. He was, however, defeated.

Diest, dēst, Belgium, town in the province of Brabant, 32 miles northeast of Brussels. It was once strongly fortified. Pop. 8,531.

Diet, a meeting or assembly of delegates or dignitaries convened and held from day to day for legislative, ecclesiastical, political, or administrative purposes; specifically, the legislative assemblies of the German empire, Austria, the cantons of Switzerland, etc. The Diet of the German empire was composed of three colleges; one of electors, one of princes, and one of imperial towns, and began with the edict of Charles IV. in 1356. Each college deliberated by itself the agreement of all three together with the assent of the emperor being finally necessary for passing judgment. The best-known meetings were those at Nuremberg 1467, Worms

1521 (at which Luther was excommunicated), Spires 1529, and Augsburg 1530.

Diet. See NUTRITION.

Dietetics is the branch of hygiene that deals with the recovery or maintenance of health by right habits of eating and drinking. Diet is the daily fare regulated in accordance with a scientific study of foods and of the needs of the human body. The words diet, dietetics, and dietary, in their modern significance, appear to have a mixed origin. The dictionaries trace their derivation through the French *diète* to the Latin *dieta* and the Greek *diaita*, the latter signifying a manner of living. Another meaning, often marked archaic or obsolete by lexicographers, is "daily fare," "allowance of food," "daily pay."

> And for his diet, there was a continual diet given him of the king of Babylon, every day a portion until the day of his death, all the days of his life.—Jeremiah lii. 34.

This meaning has an evident connection with the Latin *dies*, day, and is followed in the modern use of the word dietary. As defined by Mrs. Ellen H. Richards, a dietary is "a known amount of food, of known composition, per person, per day." Popularly, dietary appears to be associated with cheap fare, perhaps because first used in connection with the allowance of food for paupers and prisoners. The word diet also conveys to the average mind the idea of a reduced food supply, probably because the individual choice is restricted.

Under primitive conditions, men satisfied hunger with any edible substances within reach. The progress of civilization, with the increase of material possessions, developed the epicure and gourmand, who magnified the pleasures of the table. The aid of the physician was then required to mitigate woes induced by over-indulgence. In the days of Hippocrates, dietetics was the province of physicians, who thus aimed to undo the evils caused by wrong living. Later, economists like Count Rumford applied dietetic principles to feeding the poor of European cities. Some countries have employed experts to prescribe rations for keeping army and navy in fine physical condition at least expense to the government. The victory in the Franco-Prussian war of 1870 has been ascribed to the food experiments of German chemists. The *erbswurst*, or pea sausage, a food having merit for emergencies, was devised by scientists at that period. Oleomargarine was the result of experiments made for the navy under direction of the French government. The aim of dietitians of the present day includes all that has gone before, the best use of materials at hand, prescription of food for the sick, and aid to the well in choosing such foods as shall maintain health, with due regard to pleasing the palate. The 20th century finds prevention wiser than cure, and endeavors by the prescription of food adapted to different ages and conditions of body to develop the sound body and sane mind. At the present time no less emphasis is laid upon diet for diseased conditions of the human body than in the past, but more attention is being given to building up healthy bodies, and then sustaining them by foods chosen with special reference to the work each individual has to do. Some study of dietetics is now included in the preparation of the citizen for life. In the public schools it is a part of the lessons in physical training, cooking or domestic science. A practical course in dietetics would cover the source and manufacture of foodstuffs, the processes of cookery and wise combinations of foods, the calculations of dietaries for individuals, families and institutions, and the adaptation of foods to individual needs according to age, sex, climate and occupation. Students of history and sociology are recognizing the effect of food in forming individual and national characteristics. The French revolution, and the destruction caused later by the Communists, has been ascribed to the ill-fed condition of the people.

Fresh air, pure water, and clean food are more essential for nutrition than any special selection of foods. The surroundings and instincts of a people lead them to adapt their diet to the climate. In the tropics fruits and vegetables are the main sources of subsistence, in arctic regions foods are chiefly animal and largely fat, supplying the heat needed by bodies subjected to severe cold. A mixed diet, both animal and vegetable, has produced the most successful races.

The usual classification of food substances is outlined by the United States Department of Agriculture in the above table.

UNITED STATES DEPARTMENT OF AGRICULTURE. *Nutritive Ingredients (or nutrients) of food.*

Food as purchased contains —

- Edible portion (e. g., flesh of meat, yolk and white of eggs, wheat, flour, etc.)
 - Water.
 - Nutrients
 - Protein.
 - Fats.
 - Carbohydrates.
 - Mineral matters.
- Refuse, (e. g., bones, entrails, shells, bran, etc.)

Uses of nutrients in the body.

Protein (e. g., white (albumen) of eggs, curd (casein) of milk, lean meat, gluten of wheat, etc.)	Forms tissue	All serve as fuel to yield energy in the forms of heat and muscular power.
Fats (e. g., fat of meat, butter, olive oil, oils of corn and wheat, etc.)	Are stored as fat.....	
Carbohydrates (e. g., sugar, starch, etc.)	Are transformed into fat...	
Mineral matters (ash)..... (e. g., phosphates of lime, potash, soda, etc.)	Share in forming bone, assist in digestion, etc.	

Sometimes it appears difficult to reconcile practical usage and scientific experiment as to food values, but this is due to an incomplete view of both sides. Many statements about foods are untrue because only one phase is presented. To decide upon the full value of any food we must consider both its physical and chemical composition, its economic value and its physiological effect in the body. The elimination of refuse, and the division and subdivision of particles in the process of manufacture are important factors in the nutritive value and digestibility of foods. Some experiments have shown that a larger percentage of peas and beans was digested when thoroughly cooked and sifted, after removing the hull, than when cooked whole. Such external digestion saves energy in the human organism. Whatever tends to cleanse and purify foods before cooking undoubtedly increases their real nutritive value. Medical authorities on dietetics have laid much stress upon the choice of foods, but hardly enough upon their preparation. A piece of meat or a vegetable, however innocent in itself, may be ruined in cooking, while one of doubtful value, by right processes of cookery, may become harmless and even useful. This is equally true from the economic standpoint. Count Rumford found that "the richness or quality of a soup depended more upon the proper choice of ingredients and a proper management of the fire in the combination of these ingredients, than upon the quantity of solid nutritious matter employed; much more upon the art and skill of the cook than upon the sums laid out in the market." The nutritive qualities of many foods are doubtless made more available by a wise use of flavors, which in themselves contain little or no nutriment. Condiments and spices, tea and coffee, and the extractives of meats are of special value for the flavor which they impart. The cheap substantial grain foods after all provide the larger part of the food of the human race, and are made palatable by changes in flavors.

The hours and arrangement for meals have an influence in the assimilation of food. Breakfast in America is a more substantial meal than it is in Europe, perhaps from climatic conditions. The midday dinner seems best adapted to children and invalids, the night dinner is a concession to the competition of business. One dietetic authority estimates that more than half of the day's ration of protein and fat and one third of the carbohydrate is taken at dinner. Therefore the hour of the meal should be such as to provide for a period of rest afterward. The savage gorges himself when food is abundant, then sleeps like an animal. The gourmand of classic days took an emetic to relieve his stomach that he might partake of delicacies yet to come. The best thought of the present day tends to shorter menus and simpler compounds, toward "plain living and high thinking."

Dietetic theories vary from age to age because of imperfect knowledge of bodily processes, or because of changes in the production and preparation of foods. Water, for example, was once excluded mainly from the dietary of patients suffering from fevers, and its use restricted in other cases. Now it is recognized that a lack of water in the diet is a serious error, and that many of our foods as served are not sufficiently diluted with water. In the past an exaggerated nutritive value was ascribed to beef tea and to gelatine, but later investigations show that the one should be classed as a stimulant, and the other not so much a real food as a protein sparer. Other points regarding which opinions have changed are these: The relative merits of different preparations of wheat, especially of the whole wheat and white flours. The former is probably better for young children, because it supplies bone-making material, but by modern methods of milling most of the nutritive material in the grain is retained in the best grades of white flour. The natural instinct of children for sweets has been repressed, but now sugar is recognized as a valuable food, provided it is taken at proper times. Oysters are less nutritious than is popularly supposed, and as ordinarily cooked are not especially easy of digestion. Combinations of foods often produce different effects from the separate ingredients, and small quantities of certain things may be helpful where larger quantities would produce bad results. A food may be nutritious, economic in the true sense, and prepared in such a way as to be easily acted upon by the digestive organs, and yet fail of perfect assimilation because it does not suit the habit or whim of the eater. In popular estimation a food is digestible when no feeling of discomfort follows after eating it, or when it is easily and quickly digested. The scientist considers a food digestible in proportion as it is completely digested whether the time be shorter or longer. Persons in health should consume some foods that digest slowly, and beware of depending upon pre-digested foods. If allowed to be idle, the stomach, like any other organ, soon finds it difficult to work.

The seven ages of man described by Shakespeare might illustrate the different periods of life calling for a change in diet.

The infant thrives and grows on a diet of milk. When the mother cannot supply a sufficient amount, clean milk from a healthy cow, by dilution with water or whey and by modification with milk and cream, may be adapted to the increasing needs of a baby as it develops. Greater cleanliness in collecting and transmitting milk to consumers is a first requisite for the diet of young children. Defective nutrition causes indigestion, rickets, intestinal catarrh and many disorders of childhood.

The schoolboy requires abundant food from which to construct his rapidly growing body and to provide energy for his active exercise. With him quantity is often more important than quality, while his sister, enjoying less active sports, is over-fastidious. Dainty children and excessively greedy ones both are usually ill fed. Nervous diseases of children, even stammering, will yield to more careful diet. Milk, fruit, cereals, whole wheat bread, eggs and vegetables should form the bulk of the diet of school children. The school luncheon now receives considerable attention from educators.

The lover and the soldier represent the college days and the strenuous life of early manhood. The training-tables for athletes in school and college are an admission of the need of a selected diet for special work. The definition of an army, given by a famous general — an animal that crawls on its stomach — indicates

the importance of proper food for the soldier. No less necessary is it for captains of industry, pioneers and explorers of all kinds. Personal idiosyncrasy and differentiation of occupation demand attention to the individual dietary.

The justice is the type of the prosperous man of sedentary habit who is often overfed, and who should begin modifying his diet after passing the half-century mark, but habits are formed and changes must be made gradually. Luigi Cornaro, an Italian who lived in the 15th and 16th centuries, began at 40 to modify his diet and succeeded in passing the century limit. After he had reached 80 years he wrote several treatises describing his manner of living. That his writings are still the basis for much that is written on diet for the later years of life, is a sad commentary on the self-indulgent habits of the human race, which shorten many valuable lives.

> I have come to the conclusion that more than half the disease which embitters the middle and latter part of life is due to avoidable errors in diet, . . . and that more mischief in the form of actual disease, of impaired vigor and of shortened life, accrues to civilized man . . . from erroneous habits of eating than from the habitual use of alcoholic drink, considerable as I know that to be.
>
> Sir Henry Thompson.

Last of all comes old age, and for this period the food should be similar to that of the young child, and taken often in small quantities. In proportion as activity diminishes, the intake of food should decrease. The sense of taste is dulled and higher seasonings may be desirable. Here if anywhere in a normal diet the stimulus of alcoholic beverages may be allowed.

During the last of the 19th century much data has been collected showing how people actually live, the cost of living and the proportions of protein, fat and carbohydrates. The studies on food and dietaries conducted by the United States Department of Agriculture have furnished much valuable data which is being used as the basis of further work on dietetics by authorities on both sides of the Atlantic. From such studies may be deduced approximate dietaries for different conditions. The ration enabling a man to do good work must necessarily be larger than one calculated merely to sustain life.

An estimated life ration for one day, measured in grams:

Protein.	Fat.	Carbohydrates.	Calories.
75.	40.	325.	2,000.

When poor families are found living on rations lower than this their diet must be enriched before they can be expected to display much energy. Prisoners often have different rations according to their time of sentence in some reformatories, and a man refusing to work is fed with stimulating food until he desires to expend some of his accumulated energy. A work ration would provide in grams:

Protein.	Fat.	Carbohydrates.	Calories.
125.	125.	450.	3,500.

For severe labor this would be increased. (The calory is approximately the amount of heat which would raise one pound of water 4° F. and is a convenient standard of measure of the fuel value of food. The fuel value of protein is 4 calories per gram, or 1,820 calories per pound; fuel value of fats, 8.9 calories per gram, or 4,040 calories per pound; fuel value of carbohydrates, 4 calories per gram, or 1,820 calories per pound.)

The estimate of the value of food in construction of new tissues is less simple than its fuel value. It is impossible to measure the amount of good that might be done in schools, hospitals, and public institutions by improving the conditions of diet. Many hospitals now employ trained directors to make dietaries and superintend their preparation. The United States Department of Agriculture issues many valuable dietary bulletins.

Diet for the sick may be considered under three general heads: the typical ration for invalids, in fluid form, suitable for the crisis of acute disease; food for the convalescent or for building up a body wasted through lack of nutrition; and last, such diet as may aid in the reduction of an overloaded body but yet sustain the vital forces. For the first few days of an acute illness the human body may sustain itself on the surplus stored in its tissues. An invalid in bed is not using up energy so fast as the man at work, hence the diet should be less generous, not a work ration but a life ration increased in such directions as may best combat the waste of disease. Liquids are easily taken, quickly absorbed, and as a whole are less irritating than solids to the digestive organs. Concentrated foods are necessary in certain conditions, but these are few. A sick person for the time being is to be fed much like an infant — small quantities of food should be given often, usually warm rather than cold. Pre-digested foods should not be used until ordinary forms fail. Where there are wasted tissues to repair — as in convalescence or in diseases like anæmia, nervous prostration, or tuberculosis, the diet must be generous — milk and eggs are the main dependence, and the art of cookery has devised many simple ways of serving them. Fat, in easily digested forms — olive oil, bacon, cream, and butter — is valuable in such cases, because fat is two and a fourth times as valuable for fuel food as the carbohydrates. For the capricious appetite attractive arrangement and service of the food, and the element of surprise are important. The cookery for the sick conforms to the usual formulas, though greater attention must be given to the selection of food and its preparation, and all doubtful articles must be avoided. Starches should be thoroughly cooked, woody fibre reduced by cooking and mashing, or removed by straining. Animal foods should be cooked at low temperature. High, composite seasonings are not desirable, but a moderate use of simple flavors is admissible. Gout, rheumatism, and obesity may not be due to over-eating in one sense, but indicate an excess of certain substances which are neither assimilated nor eliminated, but are stored up in the various tissues, causing discomfort. The many fasts of the early Church perhaps were introduced less as a religious duty than as a wise dietetic measure. The "Banting" system for the reduction of fat consists mainly in decreasing the allowance of starch and fat and increasing the protein. Special diets for other diseases should, like medicine, be prescribed by the physician in charge, because of the complications to be considered. Water-cures, milk-cures, and grape-cures have been successful in some cases. Increased knowledge of bacteria has explained many heretofore

mysterious cases of poisoning, and has changed the point of view regarding the wholesomeness of various food products. Greater attention to cleanliness in all preparation of foods would make the use of preservatives practically unnecessary. With our rapid increase in prosperity Americans in future need to guard against over-indulgence of the sense of taste and to control the appetite to accord with the true needs of the body.

Bibliography.— Some of the most useful books on this subject are these: Abel (Mary H.), 'Practical Sanitary and Economic Cooking'; Atwater (W. O.), 'Principles of Nutrition and Nutritive Value of Food' (United States Department of Agriculture); Burnett (K. W.), 'Foods and Dietaries'; Chapin (H. D.), 'Theory and Practice of Infant Feeding'; Dukes (Clement), 'School Diet'; 'Food as a Factor in Student Life' (University of Chicago); Fothergill (J. M.), 'Manual of Dietetics'; Hart (Alice M.), 'Diet in Sickness and Health'; Holt (L. E.), 'Care and Feeding of Children'; Hoy (A. H.), 'Eating and Drinking'; Hutchison (R.), 'Food and Dietetics'; Knight (Jas.), 'Food and Its Functions'; Langworthy (C. F.), 'Dietary Study of Groups, etc.' (Bulletin United States Department of Agriculture); Miles (E. H.), 'Muscle, Brain, and Diet'; Richards (Ellen H.), 'Cost of Food'; 'Plain Words About Food'; Richards and Williams, 'Dietary Computer'; Thompson (Gilman), 'Practical Dietetics'; Thompson (Sir Henry), 'Food and Feeding'; Yeo (I. B.), 'Food in Health and Disease.'

ANNA BARROWS,
Teacher and Editor, Boston, Mass.

Dietrich, dēt'rĭh, **Christian Wilhelm Ernst,** German painter: b. Weimar 30 Oct. 1712; d. Dresden 24 April 1774. The picture of a peasant drinking, in the Dutch style, executed by Dietrich while a boy, is in the Royal Cabinet of Engravings at Dresden. He successfully imitated Raphael and Mieris, Correggio and Ostade. His paintings are scattered through almost all Europe. In the Dresden gallery, of which he was inspector, there are 34 of them.

Dietrich von Bern, fōn bĕrn, a hero of German legend, celebrated for his amazing adventures, and figuring in the 'Nibelungenlied.' He was in actual life Theodoric the Great, founder of the Ostrogoth monarchy; but the two names have resulted in much confusion of legend with fact. He flourished in the 5th and 6th centuries of our era. Bern is German for Verona, the principal residence of Dietrich.

Dietrichson, dē'trĭk-sŏn, **Lorents Henrik Segelcke,** Norwegian poet and historian of art and literature; b. Bergen 1 Jan. 1834. While an undergraduate in the University of Christiania, he composed many clever student songs which were collected and published in 1859. He published the poem 'Olaf Liljekrans' in 1857, and 'Kivleslätten' in 1879. His writings are numerous and among them are: 'Didactic Poetry in the North' (1860); 'The Art of Wood Sculpture in Norway' (1879).

Dieu et Mon Droit, dē-ė ĕ mŏń drwä (Fr. signifying "God and my right"), the motto of the arms of England, first assumed by Richard I., who flung this battle-cry at his French adversaries during the engagement at Gisors, 1195, to intimate that he did not hold his empire in vassalage of any mortal. It was revived by Edward III. in 1340, when he claimed the crown of France. Except during the reigns of Elizabeth and Anne, who used the motto, *Semper eadem,* and of William III., who used *Je maintiendray* as his own motto (*Dieu et mon droit* being retained on the great seal), it has ever since been the royal motto of England.

Dieulafoy, Jeanne Rachel Mayre, zhŏn rä-shĕl mār dē-ė-lä-fwä, French descriptive writer and novelist: b. Toulouse 29 June 1851. She is the wife of A. M. Dieulafoy (q.v.). Her narrative of travel in 'Persia, Chaldæa, and Susa' (1886), and her fiction 'Parysatis' (1890); and 'Rose d'Hatra' (1891), are evidences of her talent.

Dieulafroy, Auguste Marcel, French engineer: b. Toulouse 3 Aug. 1844. In 1885 he discovered in Persia the remains of the royal residences of Artaxerxes. His discoveries are described in his 'L'art antique de la Perse' (1884–9).

Diez, dēt., **Friedrich Christian,** German philologist; b. Giessen 15 March 1794; d. Bonn 29 May 1876. Having qualified himself as a lecturer at Bonn, he was appointed professor of modern languages there in 1830. In addition to various works on the poetry of the Troubadours, he published a very valuable 'Grammatik der Romanischen Sprachen' (1836–42), which was translated into English, and an 'Etymologisches Wörterbuch der Romanischen Sprachen' (1853), also translated into English. Diez laid the foundation of Romance philology, and to him all later investigators are profoundly indebted. His work stands in much the same relation to the Romance dialects as the researches of Grimm occupy with respect to the German dialects.

Difference, in heraldry, an additional figure or an alteration in a coat-of-arms to distinguish one family from another of the same strain, or particularly to mark the difference between brothers and their descendants during the lifetime of the head of the house. Sometimes this is accomplished by variations of the bordure, such as having it ingrailed, invected, embattled, ets. But usually the eldest son bears a label or lambel; the second son, a crescent; the third, a mullet; the fourth, a martlet; the fifth, an annulet; the sixth, a fleur-de-lys; the seventh, a rose; the eighth, a cros-moline; the ninth, a double quatre-foil.

Such marks of heraldic distinction cannot be regulated by cast-iron rule or set law. Each country follows the customs resulting from its own particular régime, which seem to be the adoption of changes on an escutcheon best suited to individual needs. Difference is commonly confounded with Cadency (q.v.).

Differential Equations. See EQUATIONS.

Differential Thermometer, an instrument for determining the difference of temperatures between two points or places. That of Sir John Leslie is one of the best known, and will be found described under THERMOMETER. His invention is now used only as a thermoscope. A pair of thermo-electric junctions (see THERMO-ELECTRICITY) is generally preferable to any other kind of differential thermometer. One of the junctions is put at one of the points, and the

other junction at the other point, and a galvanometer is introduced in the usual way into the circuit, great care being taken to keep all the other junctions of whatever kind that occur in the arrangement strictly at the same temperature. The strength of the current generated, which is measured by means of the galvanometer, is, with the limitation that will be found explained under the article just alluded to, proportional to the difference of temperature between the two thermo-junctions; and with the assistance of a previous experiment at known temperatures on the thermo-junctions employed, the absolute difference of temperature between the two points at which the junctions are placed may be determined with great exactness.

Differentiation, in biology, that organic process which occurs when certain parts of a uniform whole become structurally different from the others, or when, in other words, the homogeneous becomes heterogeneous. Inequality in internal and external conditions of life brings about restriction of certain vital processes and the predominance of others, and as this division of function is established, diversity of structure results. Differentiation is the structural change which is associated with the physiological "division of labor," and the process is essentially the same whether it find expression in cells, tissues, organs, or entire organisms. See Division of Labor; Evolution; Variation; etc.

Diffraction of Light, the bending of the rays of light, due to interference, as of the slits or ruled lines in a diffraction grating. The study of the diffraction of light has given us the spectrum, and the study of spectrums, through the spectroscope, has added greatly to the sum of human knowledge of the constituents of heavenly bodies. A simple way of noting the diffraction of light is to darken a room and allow a ray to penetrate between the edge of a shade and the window jamb. The light falling on the opposite wall is not a well-defined streak, like the aperture through which it passes, but is divided into a series of upright streaks or bands, showing that the rays of light bend or are diffracted in passing through the slit. Interesting experiments with diffraction can be made by allowing the light to pass through a hole or holes of different forms. The phenomena of diffraction were first noted and commented on by Grimaldi, of the Jesuits' college of Bologna, in 1665. Sir Isaac Newton investigated the subject, and explained it further. About 1819 Fresnel demonstrated that interference was result of the wave motion of light and that sound waves are similarly affected. Joseph von Fraunhofer, of Munich, made a most exhaustive study of diffraction, and classified the lines of the spectrum, which became known as "Fraunhofer's lines." He invented the diffraction grating about 1821, for exhibiting the lines and forming the spectrum. This grating, as at first made, was a glass surface, smoothed as perfectly as possible, and covered with a thin film of gold-leaf, lampblack, gelatine, or the like. Through this film were scratched or ruled parallel lines, constituting minute apertures for light. In order that these lines might be made very fine, close, and accurate, the dividing engine (q.v.) was devised. With this were ruled a great many thousand lines to the inch. These lines must be exactly the same distance apart to be valuable. When the light was allowed to pass through the rulings or slits of this transmission grating to a screen, the light on the screen was divided or dispersed, appearing in bands, and forming a spectrum. It was found that to obtain a satisfactory spectrum, a grating of 15,000 to 20,000 lines to the inch was desirable, and even very much finer rulings have been demanded and manufactured. In order to use gratings ruled on plane surfaces for spectroscopic purposes, it is necessary to employ a telescope and collimator. After a time the reflecting grating was invented. In this a surface of speculum metal was ruled, and this had some advantages over glass. Prof. Henry A. Rowland, of Baltimore, has achieved distinction in the production of improved diffraction gratings, making a reflecting grating with a concave surface, that can be used without lenses. The diffraction grating has been much used in studying the solar spectrum. See Light; Spectrum; Spectroscope.

For further information as to diffraction gratings, see 'Gratings in Theory and Practice,' in 'Astronomy and Astro-Physics,' Vol. XII., 1893. For information as to diffraction, consult Preston, 'Theory of Light' (London 1895).

Diffusion, in physics, is the graduat and spontaneous molecular mixing of two fluids in contact. It takes place regardless of or in opposition to gravitation, and is due to the mutual attraction of molecules. Diffusion is most common between gases, and the lighter the gas the faster does diffusion take place. It also occurs between viscous substances and, in some cases, between solids. A common experiment for exhibiting the diffusion of gases is to place in contact vessels of hydrogen and oxygen. After a time it is found that the contents of both vessels are alike — a homogeneous mixture of the two gases. If the heavier gas is placed below the lighter, the result is the same, demonstrating the fact that gravity does not check the result. If chlorine is one of the gases used, its color will enable the eye to follow the diffusion. If a porous body is placed between the vessels, the rate of diffusion can be measured. This fact is taken advantage of in the construction of the diffusiometer, invented by Thomas Graham. This consists essentially of a tube containing a gas, the lower and open end of the tube being dipped in mercury, while the upper end is closed with a porous plug. The rise of the mercury in the tube serves to measure the diffusion of the gas through the plug. Another method of testing diffusion is to fill a diffusion-tube with hydrogen and immerse the lower and open end in water, while the upper end is closed with the porous plug. Diffusion then takes place both ways, into the water and into the air.

Alcohol and water afford one of the readiest means of testing the diffusion of liquids. They will diffuse the same as gases, regardless of gravity. Stirring the two hastens the diffusion, because it brings a larger surface of one liquid against the other. At the same time the action is not a mixing in the ordinary sense, but a mixing of the molecules, forming a liquid that is of like proportions throughout when the diffusion is complete. If water in a glass vessel be colored with a few drops of litmus solution, and sulphuric acid be introduced through a tube to the bottom of the vessel, care being taken not

to disturb the water, the diffusion may be observed visually. The water, which is blued by the litmus, turns from blue to red as the diffusion of the sulphuric acid progresses. Some manufacturers of sugar have used the principle of diffusion for extracting cane-juice, and also for making an extract from beet-root. Hot water is applied to the cut cane, and diffusion withdraws a large part of the juice, securing the sugar. Surgeons have also utilized diffusion to cause a liquid to pass through a membrane or tissue of the body. It is the principle of diffusion of liquids that enables the druggist to compound the several items of a prescription. The uniform strength of his solutions and extracts is also largely dependent upon diffusion. If it were not for this, several fluids in a vessel would tend to arrange themselves in layers according to gravity, as is the case with water and oil, which do not diffuse together. Substances in solution also diffuse, following Fourier's law of the diffusion of heat. As the temperature rises the rate of diffusion increases. Since the rate of diffusion of different solutions and liquids varies, it becomes possible to separate component substances in solution, by taking advantage of the difference in rate of diffusion of each component. It has been demonstrated that some solids diffuse, though with extreme slowness. Lead placed upon gold for a period of years will be found to contain gold to a slight distance above the point of contact.

For a fuller understanding of the diffusion of gases, see KINETIC THEORY. Compare also OSMOSIS, which is, practically, diffusion taking place through a membrane.

Digam'ma, in the Greek language. In addition to the smooth and rough breathings, the ancient Greek language had another, which remained longest among the Æolians. This is most commonly called, from the appearance of the character used to denote it, which resembled our letter F, a *digamma*, that is, double Γ. It was a true consonant, and appears to have had the force of *f* or *v* or our *w*. It was attached to several words, which, in the more familiar dialect, had the smooth or rough breathing. Though the whole doctrine of the digamma is obscure, yet it is found in early Greek words, especially in Homer.

Digby, SIR Everard, English conspirator: b. 16 May 1578; d. 30 Jan. 1606. He enjoyed some consideration at the court of Elizabeth and James I., by whom he was knighted. Being gained over by Thomas Tresham to the extreme Catholic party, he was induced to give £1500 toward the expenses for the execution of the gunpowder plot. On the discovery of the conspiracy he was tried and hanged in 1606.

Digby, SIR Kenelm, English physical philosopher: b. Gothurst, Buckinghamshire, 11 July 1603; d. London 11 June 1665. His great-grandfather bore arms for Henry VII. on Bosworth field; his father, Sir Everard (q.v.) died on the scaffold as one of the leading Catholic gentry implicated in the gunpowder plot, 1606. Kenelm, then 3 years old, was educated as a Protestant, but at the age of 33 returned to the faith of his fathers. After completing his academic studies at Oxford he went on his travels through France, Spain, and Italy; in 1628 equipped at his own cost a squadron against the Algerine corsairs, and incidentally defeated a Venetian force off Scanderoon. Returning home, 1638, he was thrown into prison as a royalist and not liberated till 1643, when he retired to France; there he was in high favor with the court and with men of learning and philosophers, among them Descartes. At the overthrow of the royalist cause he returned to England but was banished under pain of death by the Parliament. He then for a time served the French king in various embassies, but under the protectorate came back to England and was admitted to the intimate friendship of Cromwell. He was one of the founders of the London Royal Society. His works on physical philosophy, on natural science and on metaphysical subjects possess now only the interest of curiosity; among them are a 'Treatise on the Nature of Bodies,' 'Peripatetic Institutions,' 'Treatise on the Soul,' etc. On religious matters he wrote many books, among them 'A Conference About a Choice of Religion,' and 'Letters' on the same subject. His brief critique of Sir Thomas Browne's 'Religio Medici' gives a specimen of his style of argumentation. He was all his life an inquirer into occultism and wrote a book on 'The Cure of Wounds by the Power of Sympathy;' he hoped also to discover a means of conserving into old age the extraordinary personal beauty of his wife, and invented cosmetics to that end.

Digby, Kenelm Henry, English antiquarian; b. 1800; d. London 22 March 1880. He was graduated from Trinity College, Cambridge, in 1819, and in 1822 published 'The Broad Stone of Honor,' "that noble manual for gentlemen," as Julius Hare called it, "that volume which, had I a son, I would place in his hands, charging him to love it next to his Bible." It was much altered in the 1828 and subsequent editions (the latest 1877), its author having meanwhile become a Roman Catholic. Among his other works may be named 'Mores Catholici, or Ages of Faith' (1831–40).

Digby, William, English journalist and East India merchant: b. Wisbech, Cambridgeshire, 1 May 1849; d. 24 Sept. 1904. He was engaged in newspaper work in England 1868–71; in Ceylon 1871–6; in Madras 1877–9; and again in England 1880–2. After 1888 he was an East India merchant in London. He has published: 'Forty Years' Citizen Life in Ceylon'; 'The Famine Campaign in Southern India' (1876–8); 'History of the Newspaper Press of India, Ceylon, and the Far East'; 'Indian Problems for English Consideration'; 'Nepal and India'; 'Condemned Unheard'; 'Indian Economics'; 'Prosperous British India' (1901); 'Natural Law in Terrestrial Phenomena'; etc.

Digby, Nova Scotia, on Saint Mary's Bay A United States consular agent is stationed here. The town is noted for its curing of a variety of small herrings or pilchards. Pop. 1,150.

Di'gest. See CIVIL LAW.

Digest'ants, remedies that aid digestion, and which may include such agencies as exercise, sunlight, and pleasurable emotions, although the term is usually restricted to the drug agents that modify the secretions found in the stomach and intestines. The most important of these drug agencies that are employed for the

purpose of stimulating the appetite are the bitters, such as cinchona, columba, quassia, nux vomica; the carminatives, such as cinnamon, cloves, ginger, cardamom, capsicum, peppermint; alcoholic mixtures, such as the wines, brandy, whiskey, the cordials; the digestive ferments, such as diastase, pepsin, pancreatin; and the weak alkalies and weak hydrochloric acid.

Digester, a closed boiler in which a temperature above the boiling point can be obtained, the hot water and steam disintegrating or digesting the substance treated. The invention of the digester is credited to Denis Papin, a French scientist. He noted that anything boiled in an open vessel was not subjected to a heat above 212° F., as the water went off into steam at that temperature, and was lost. Accordingly he constructed a boiler with a closed top, to retain the steam, and succeeded in securing a temperature of 400° F., which served to readily digest bones. This digester came into use for the manufacture of soups and gelatines from bones that had been previously wasted or thrown to the dogs.

Within recent years the digester has found a place in a number of industries. The lard or grease tank of a slaughter-house is a digester. In some American cities digesters have been employed to receive garbage and secure a product of some value from the refuse. Tannin is extracted from nutgalls by a digester, in which the material is saturated with ether.

The digester has found its most extensive use, however, in paper-making. The wood, which is abraded by grinders from the log is introduced in a form resembling fine sawdust to the digester, and comes out pulped, ready to be rolled into paper. Sulphite digester is the common name for these mechanisms owing to the fact that a bisulphite solution is employed in the process of digesting. This serves as a solvent, but being acid it attacks the iron or steel of which the digester is constructed. To protect the iron shell various linings are employed. The "Non Antem" digester employs a lining made of a continuous sheet of lead placed against the inner sides of the shell, and held in place by two courses of acid-proof brick. The Mitscherlich digester is lined with acid-proof brick laid in Portland cement. The Graham digester is made of sheets of boiler plate, with the lead lining soldered on before bending. The Partington digester is made spherical, so that the lead lining tends to maintain its place from its form; the lead is also burned to the iron. Pusey & Jones build a digester of welded steel, with double shells and no lining. The Schenck digester is also unlined, being made of deoxidized bronze, and in both of these last-named the erosion is claimed to be very slight.

Most sulphite digesters are built in the form of an upright cylinder, with one or more manholes at the top, through which the ground wood is introduced. Steam is admitted by coils, and a high temperature maintained for about eight hours. When properly cooked, the liquid is run off and the digested material withdrawn by manholes in the bottom.

Digestion, the change which food undergoes in order to prepare it for the nutrition of the animal frame. It is carried on in the higher animals in the digestive system. In some of the lowest forms of animal life (amœbæ) which have no special organs, particles of food are drawn into the body and digested. In higher organisms there is a simple pouch which leads inward from the centre of the cluster of tentacles; into this fish and other food are drawn and digested, while the undigested parts are afterward voided through the same aperture by which they entered. In still higher organisms, man himself included, this simple pouch is changed into a complex and greatly elongated tube, which is provided with one aperture (the mouth) by which food enters, and another aperture (the anus) through which undigested matter leaves the body. The mouth in most animals is provided with hard tissues — teeth, beaks — for the subdivision of food before it is swallowed. Vegetable feeders, eating tough grains, roots, and fibres, have large molar or grinding teeth, while the carnivora have these same teeth modified so as to present a cutting edge, with which and their pointed canines meat is torn and cut into pieces, which are then swallowed. Below, the cavity of the mouth passes into the gullet or œsophagus, and in front of this tube runs the windpipe. Food will pass through the pharynx, or the interior of the throat, into the gullet; and air, during respiration, passes through the pharynx on into the larynx and windpipe; a valve called the epiglottis partly closes the aperture of the larynx.

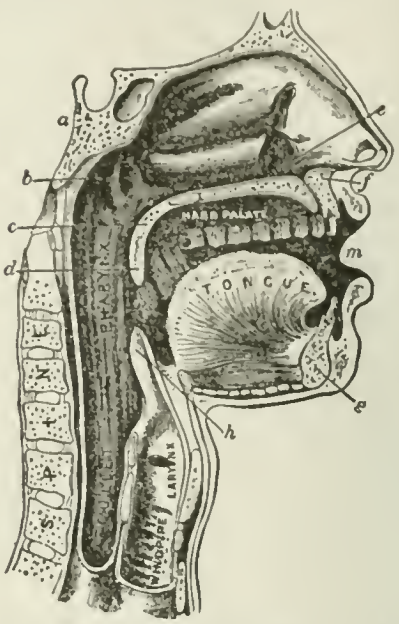

FIG. 1.— Section Through Mouth, Nose, etc.— a, sphenoid bone; b, Eustachian tube; c, soft palate; d, uvula; e, nasal passage; f, upper jaw; g, lower jaw; h, epiglottis; m, mouth.

The gullet or œsophagus is a long tube passing from the pharynx to the stomach. Its mucous coat is loaded with very large glands which secrete a quantity of very viscid mucus. The stomach itself is a greatly dilated part of the digestive system. It may be said to consist of two parts, even in the human subject; a more complex arrangement is found in many animals, such as the ruminants. The large dilated portion into which the gullet opens is termed cardiac, and the opening the cardiac or

œsophageal opening. The mucous membrane, which, whole is lined with in the empty stomach, is thrown into projecting folds or rugæ, but these folds are effaced when the organ is distended with food. In the membrane are innumerable glands which secrete the digestive juices of the stomach. The gastric juice is acid, and the chief acid secreted is hydrochloric acid. The substance called pepsin, which is necessary for digestion, is secreted by the whole of the glands.

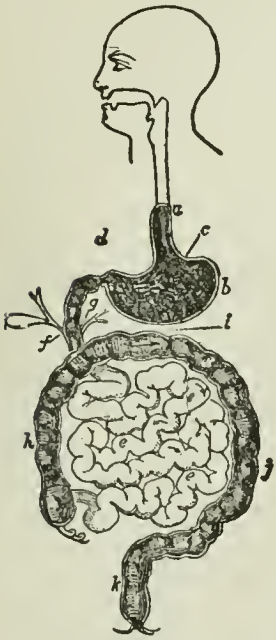

Fig. 2.—Alimentary Canal.—a, œsophagus; b, stomach; c, cardiac orifice; d, pylorus; e, small intestine; f, biliary duct; g, pancreatic duct; h, ascending colon; i, transverse colon; j, descending colon; k, rectum.

The food now called the chyme passes into the small intestine, a tube about 20 feet long. This tube, besides the muscular and mucous coats, possesses an external coat of loose fibrous tissue covered by a single layer of flat cells. This coat is prolonged into and helps to form the mesentery, a membrane connecting the intestine with the abdominal walls. This membrane is called the peritoneum. The small intestine is somewhat arbitrarily divided into three portions —the upper (duodenum), the middle (jejunum), and the lower (ileum). The mucous coat contains glands very like the pyloric glands of the stomach, called Lieberkühn's follicles. They secrete the intestinal juice. In the duodenum one finds in addition highly branched glands called Brunner's. In both the mucous and sub-mucous coats, and generally involving both layers, are found masses of tissue — lymphoid — similar to that found in a lymphatic gland. Their function is probably connected with the blood and the blood corpuscles. Collections of these solitary glands, forming oblong patches about two inches long, are called Peyer's patches. In addition to the follicles of Lieberkühn and the glands of Brunner, there are the liver and the pancreas, which pour their digestive juices into the small intestine. The bile, which is the secretion of the liver, is formed continually by that organ, but the amount thus formed is influenced by the kind and quantity of food taken. The bile is to be looked upon not only as a digestive juice, but as a drain or channel of excretion, whereby effete and useless matter is removed from the body. The pancreas is very similar in structure to a salivary gland. It secretes the pancreatic juice which pours with the bile into the digestive system. The mucous membrane of the small intestine contains, in addition, little projections called villi. These are important absorbents. This property they share with the whole of the digestive system through any part of which, and especially through the walls of the stomach and small intestine, digested matter passes into the numerous blood capillaries which form everywhere a dense network. The villi are peculiar, for each one contains in addition to blood vessels a small lymph vessel or lacteal. Nearly all the fat absorbed by the digestive system is taken up by the little cells of the villi, and passes on into the lacteals and thence to the blood.

The unabsorbed food, mixed with the various secretions we have mentioned, now passes into the large intestine, where both digestion and absorption go on, though to a less extent. The large intestine is only five feet in length, but its girth is much greater than that of the small intestine. It commences with the cæcum, a dilated part, into which passes a little blind canal (the vermiform appendix) a large and important structure in some animals. The large intestine ascends on the right side (ascending colon), crosses over to the left side (transverse colon) and descends again (descending colon), and makes a bend (sigmoid flexure), and finally terminates in a somewhat enlarged portion (rectum). The mucous membrane of the large intestine differs from that of the small intestine in containing no villi or Brunner's glands. Lieberkühn's and solitary glands are present, but the aggregation of the latter into Peyer's patches is nowhere to be found.

When food is taken into the mouth it is at once swallowed, unless it is in a solid form. In this case it is chewed into a convenient size for swallowing, for which purpose it is, in addition, mixed with the viscid saliva and juices of the mouth. Many animals can hardly be said to masticate; such are the carnivora (dog, cat, etc.), and they are not provided with grinding teeth. In most animals living on vegetable food large flat grinding molars are found. In these animals, not only is the food finely divided in the mouth, but the food, largely consisting of starch, is partially digested by the saliva. During mastication the food would nat-

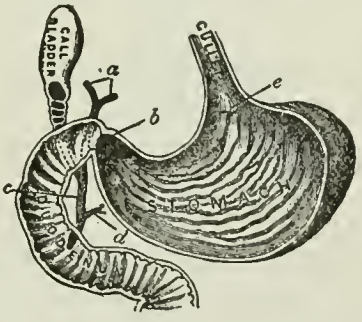

Fig. 3.— Section of the Stomach.— a, ducts of liver; b, pylorus; c, bile duct; d, pancreatic duct; e, cardiac orifice.

urally tend to escape from between the grinding surfaces of the teeth, and would collect within the mouth and outside the gums. This is prevented by the muscles placed in the substance of the cheeks and lips.

As a result of mastication, the food is gathered in the form of a round moist bolus on the upper surface of the tongue. It is now ready to be swallowed. In the first place, it is

pushed backward by the tongue and seized by the teeth, many of which are attached to the hyoid bone. According to the most recent investigation, the bolus is propelled with great rapidity through the pharynx and gullet into the stomach. Following the propulsion of the food downward there is a wave of contraction, which, commencing in the pharynx travels comparatively slowly downward through the gullet. It is seen then that swallowing is not due to the falling of liquids down the throat. A horse drinks "up-hill," and the jugglers, or indeed anyone can drink or swallow with the head vertically downward. When the food has reached the back of the mouth, swallowing occurs irrespective of the action of the will.

There is a possibility that during swallowing the food may go the wrong way — that is, it may pass into the larynx and windpipe. It is prevented from passing into it by the elevation of the larynx which pushes its aperture against

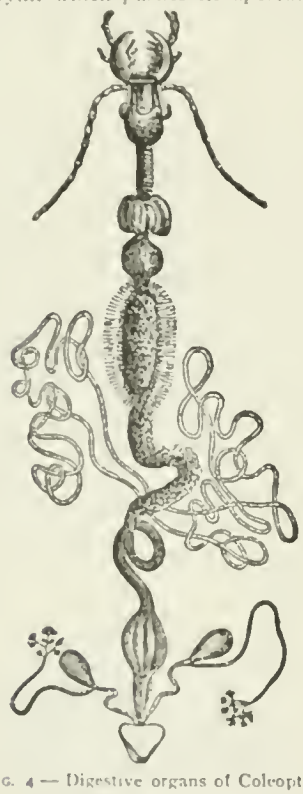

Fig. 4 — Digestive organs of Coleoptera.

and under the back of the tongue, which at the same time is pushed backward. In addition, there is a valve called the epiglottis, which is pushed down over the larynx by the movement just described and by muscular fibres which act upon it for that especial purpose. The walls of the stomach and intestines are, like the gullet, provided with muscular fibre. An external layer passes in the length of the gut, and within this is a circular layer. These muscles contract slowly on stimulation, and are outside the domain of voluntary action. During the digestion they contract peristaltically, urging the food toward the rectum. The peristaltic waves may begin in any part of the gut and pass slowly downward followed at varying intervals by other waves. Probably what is called antiperistaltic waves may occasionally occur, tending to bring the food back toward the mouth, for bilious matter is frequently vomited, the bile having in all probability passed upward into the stomach by antiperistalsis from the duodenum.

Eructations are frequently caused by antiperistalsis and by a movement of this kind food is brought back into the mouth for further chewing in the ruminants (sheep, oxen, etc.). The act of vomiting is a reflex nervous act. It can be excited by stimulating the branches of the vagus nerve, as when indigestible and irritative food is taken, or emetics are administered. By tickling the back of the throat with a feather, the glossopharyngeal nerve is stimulated and vomiting may readily be produced. It is of frequent occurrence in painful irritations of the uterine nerves in pregnancy, of the nerves of the liver and kidneys during the passage of a hepatic or renal stone, or indeed when irritation of any sensory nerves takes place. Cases in which irritating or poisonous substances are swallowed are so frequent that everyone should be aware that a large quantity of hot liquid, especially if it contains much salt or some mustard, forms a safe and speedy emetic. Ice is a valuable sedative, and often prevents vomiting.

In many animals, such as the sheep, ox, and camel, the stomach consists of several cavities communicating with one another. In the ox and sheep the cardiac and the pyloric portions are each subdivided into two compartments. The cardiac part consists of a very dilated cavity, the paunch (rumen), into which the food is passed as soon as swallowed. In addition there is a smaller part, the reticulum (honeycomb) so called from the folds of lining mucous membrane which intersects, forming a reticulum. The pyloric half is divided into two parts. The psalterium (maniplies), so called from the lamellated appearance of its mucous membrane, communicates with the last division, the rennet stomach (abomasum). Fluid passes either into the first, second, or third part of the stomach, and thence on into the fourth. Solid matter, such as grass, roots, etc., passes either into the paunch or reticulum. This is mixed with the saliva swallowed with it and in addition it is mixed with juices formed by the mucous membrane of these cavities. When the animal has finished feeding, it lies down and rumination commences. Due in part to the contraction of the abdominal muscles and diaphragm, the food is propelled in the form of rounded pellets from the paunch and reticulum up into the mouth. The pellets are there thoroughly masticated, and are returned in a pulpy condition to the stomach. Now the food passes into the psalterium, and into the rennet stomach. Hence the consistency of the food determines into which part of the stomach it passes.

In the bird some interesting modifications in the structure of the alimentary canal are seen. The gullet at about the middle of its course is provided with a pouch or crop. Into this the food passes, and is bathed by a secretion formed by its glands. It is then propelled onward into a dilated cavity, the proventriculus, and is acted on by digestive juices. Thence it passes into the gizzard. This cavity is provided with muscular walls of enormous thickness in the case of birds that are vegetable feeders. It is lined by thick and corneous epithelium, and in

its interior are generally found pieces of stone, chalk, etc. The gizzard is a powerful mill, which grinds the food into a soft pulp, upon which digestive juices can readily act. See BIRDS.

The most essential change which food undergoes in digestion is one of solution. Albumen, starch, fat, and other food-stuffs are insoluble in the circulating fluids of the body, and injected into the blood they would block up the smaller blood vessels. During digestion these pass either into nearly allied chemical substances which are readily dissolved in water, or in the case of fat partly into a soluble soap and partly into a state of microscopically minute subdivision. It is not sufficient, however, to have a soluble food-stuff in order that it may be absorbed and used by the body. Cane (table) sugar is soluble in water, but it is of no use as cane-sugar to the body. If injected into the blood vessels it is at once secreted by the kidneys. During digestion it is converted into another sugarless soluble, but in a form which can be used by the economy.

The digestion of food is brought about by the action of the saliva, the gastric, pancreatic, intestinal and other juices. These are mixed with the finely divided food by the movements of the alimentary canal. The digestive juices are in all cases secreted by the microscopic cells which line the various glands opening into the digestive system. The digestive ferments are not whole cells, they are the products of cells. They are not the broken-down, useless substances, such as carbonic acid, water, etc., which all cells give out, and which an animal like man excretes. They consist of a very complex active matter, of which we know almost nothing, and which we class with other substances of which we know little more, under the head albuminoids.

When food is passed into the stomach, secretion occurs. This, too, may result from mechanical irritation, as when through an opening (fistula) the mucous membrane is brushed with a feather. In all cases the stomach, pale before, becomes suffused with blood, and the gastric juice is poured out. The flow of the intestinal juice, the pancreatic juice, and bile all follow the stimulation of the mucous membrane, and in all cases the blood vessels enlarge so as to give the cells a good supply of food, though, as we have seen, they themselves actually pass into a condition of activity as a result of the influence of special secreting nerves. Foods belong to four classes: (1) Proteids — albumens, globulins, etc.; for example, the white of egg, the chief constituent of meat, the gluten of bread. (2) Carbohydrates — starches, sugars, gums; for example, potato-starch, cane- or grape-sugar. (3) Fats and oils; for example, suet, marrow, olive oil. (4) Minerals; for example, water, table salt, iron, phosphates.

Some few substances are absorbed without being digested at all; they do not need to be. Such are water and the minerals, though even many of these undergo some change. Grape-sugar is absorbed and probably proteids too are often absorbed to some extent at least. Fat is profoundly modified during digestion, though not as the result of any digesting ferment. The saliva, of which about 30 ounces are secreted during the 24 hours, contains a ferment termed ptyalin, which is capable of turning a starch into a soluble sugar called grape-sugar, or, according to other observers, into another soluble sugar termed maltose. The ptyalin may be extracted from the saliva or from the salivary glands themselves. It does not appear to be much exhausted during its activity and has the general characters of unorganized ferments. The saliva is alkaline, and the starchy food is no doubt partly converted into sugar during its sojourn in the mouth and gullet by its action. When the food has reached the stomach and the acid gastric juice has mixed with it, the saliva is unable to act and is probably killed. Any digested starch is subsequently converted into sugar when the food reaches the small intestine by the pancreatic juice.

When the food reaches the stomach it causes a reflex secretion of gastric juice. This is but slowly produced when insipid heavy food, such as coagulated white of egg, boiled meat, sago, etc., is eaten, but flows readily when soups, broths, and fluids containing salts and extractions in abundance are taken. Thus we have a scientific reason for beginning a dinner with soup, preserving the *pièce de résistance* until the stomach has secreted gastric juice for its digestion. The gastric juice, several pounds of which are secreted daily, is acid in reaction containing free hydrochloric acid. Lactic and butyric acids form during the progress of digestion.

Within the stomach, and capable of being readily extracted from the stomach of a calf, is a ferment called the milk-coagulating ferment (rennet). This causes milk to coagulate and form a clot or curd. It subsequently contracts and squeezes out some fluid termed the whey. It is difficult to assign any use to this ferment, for the acid of the gastric juice would of itself cause the milk to curdle. Still more difficult is it to explain the existence of a similar ferment in the pancreatic juice, for we cannot suppose that any milk can even pass through the stomach to be subjected to its action. The milk, indeed, often forms dense clots which cannot afterward be digested, and which cause considerable gastric irritation. Milk is frequently found to disagree with some stomachs; but even in such cases it may often be sipped with impunity. In this case the formation of large clots is prevented. Lime water causes the milk to coagulate in small soft clots.

Within the small intestine most of the food undigested by the stomach (q.v.) is rendered fit for absorption. This takes place through the tissue of the mucous membrane; much of the sugar and peptones find their way into capillary blood vessels. Absorbed products and notably fat globules pass into the lacteals, and thence into the blood, circulating through the veins at the root of the neck. The contents of the lacteals during absorption are called chyle. The contents of the small intestine pass into the large intestine, where digestion occurs to a very slight extent. Absorption is, however, more rapid, and the contents become far more solid as they pass toward the rectum, due to the deprivation of water and soluble substances. The absorptive power of the large intestine is important to remember; for injections per rectum of liquid food, especially if it has already been artificially digested, may sustain life for long periods.

JOHN C. HEMMETER, M.D.,
Professor in Medical Department of the University of Maryland.

Diggings, a colloquial expression among miners in North America, Australia, South Africa, etc., the term designating the places from which gold is procured by means of surface excavations. Proceeding from the mining regions this appellation has become an everyday expression in referring to a region, locality, or place, as:

'She won't be taken with a cold chill when she realizes what is being done in these diggings?' Dickens, 'Martin Chuzzlewit.'

Diggs, Annie L., American author and librarian: b. London, Ontario, Canada, 1853. She was the first woman to lead a delegation at a national political convention, serving as chairman of the delegation from the District of Columbia, at the National People's Party Convention, Omaha, 1892. She is a temperance worker and political speaker, and president of the Kansas State Woman Suffrage Association, and she has been State librarian of Kansas since 1898. She is the author of 'Little Brown Brothers,' and many short stories.

Dighton Rock, a boulder of "greenstone" (in fact, bluish-gray), in Berkley, Bristol County, Mass., opposite Dighton, the landing-place for it; on the east shore of the Taunton River, about 10 feet from low-water mark, and covered two or three feet deep at each flood tide. It is 11½ feet long and about 5 feet high, with a flat face toward the river, once covered with inscribed characters varying from scratches to one third of an inch deep, not chiseled, but "pecked" in. For many years the stream of visitors, unchecked by any authority, have so often scrubbed off the tidal deposits of dirt with brooms and water to see the characters more plainly, that most of the latter are effaced and the whole past effective study. From old drawings, however, and comparison with similar petroglyphs elsewhere, there is no doubt it is Indian; Schoolcraft says, in the symbolic character of the Kekeewin. (See Garrick Mallery in annual report of the Bureau of Ethnology, 1888–9, pp. 85–6, 762–4; from Dr. Hoffman's examination of 1886.) Enthusiasts at various times have made wonderful interpretations of it. Rafn of Copenhagen found the name of Thorfinn on the drawing sent him (see his correspondence with the Rhode Island Historical Society 1830–4, in 'Antiquitates Americanæ,' Copenhagen, 1837), and thought it a record of the Vinland settlement; an Orientalist deciphered "melek" (king), and considered it Phenician, and another believed it Scythian. Many drawings have been made of it since the first by Samuel Danforth in 1680, and a second by Cotton Mather in 1712; for which, and a picture of the rock *in situ*, see Rafn as above, and for the drawings, the report above cited.

Digit, in arithmetic, usally signifies any one of the 10 numerals, 1, 2, 3, 4, 5, 6, 7, 8, 9, 0, though zero is sometimes not regarded as a digit. The word comes from *digitus*, a finger; thus indicating the humble means originally employed in computations. Digit is also a measure of a finger's breadth equal to three fourths of an inch.

Digit, in astronomy, is the measure by which we estimate the quantity of an eclipse. The diameter of the sun or moon's disk is conceived to be divided into 12 equal parts, called digits; and according to the number of those parts or digits which are obscured, so many digits are said to be eclipsed. When the luminary is wholly covered, the digits eclipsed are precisely 12; and when it is more than covered, as is frequently the case in lunar eclipses, then more than 12 digits are said to be eclipsed.

Digitalin, dĭj'ĭ-tā-lĭn, various substances obtained from the leaves and seeds of the common foxglove (*Digitalis purpurea*), some of them being deadly poisons, but of great medicinal value, while others are almost inactive or harmless. Of these the earliest extracted was Homolle's digitalin, prepared from the leaves by the action of alcohol, ether, and lead oxide. It is a white, bitter, partially crystalline body without smell, soluble in alcohol, but not in water or ether, and has been used in medicine. Another digitalin was obtained by Walz by treating that of Homolle with ether and water; it is yellow, amorphous, soluble in water, and very powerful in its action. Another chemist, Nativelle, obtained from the leaves two crystalline bodies, known as digitalin and digitin, and an amorphous one called digitalein. Digitalin, prepared by various processes, and probably not chemically pure, is employed in medicine, being useful in stimulating the action of a weak heart, and effective also in removing dropsical fluid by its action on the kidneys; but it is apt to derange the stomach and bowels, cause loss of appetite, etc.

Digitalis, dĭj-ĭ-tā'lĭs, a name given to the leaves of the plant *Digitalis purpurea* (see FOXGLOVE), of the second year's growth. This is a biennial herb which is largely cultivated for ornament. It is about two to five feet high, with large succulent leaves and tubular urn-shaped purple flowers growing in a raceme. It is a native of southern and central Europe, and is extensively cultivated throughout the world, although the cultivated leaves are not as serviceable as those of the wild plant. The leaves, which lose on drying about 75 per cent in weight, are mostly obtained from the wild plants growing in the mountainous regions when two thirds of the flowers are expanded. The leaves should not be kept more than one year, as the quality deteriorates very rapidly. The active principles in the digitalis leaves consist of four or five glycocides: digitoxin, digitophyllin, digitalin, digitalein, and digitonin. The seeds also contain large amounts of active glycocides. The action of digitalis on the body is complex. It is primarily a local irritant causing secondary paralysis of the sensory nerve-endings. It is bitter to the taste, followed by burning and swelling of the mucous membrane. It is an irritant to the intestines, where it may cause nausea and vomiting. After absorption the chief action of the drug is on the central nervous system, the heart, and the blood vessels. The action on the nervous system is of secondary value to the heart activities, although there is distinct stimulation throughout. The action of the drug on the heart-muscle is the most important property possessed by digitalis, both pharmacologically and therapeutically. Here, by reason of the complicated physiology of the heart action, the differing effects of digitalis on this organ are somewhat difficult to comprehend. Digitalis stimulates primarily the muscular fibres of the heart. It stimulates the cardiac nervous gang-

lia; and it stimulates, and then paralyzes, the cardiac inhibitory nerve, the pneumogastric. Thus the normal heart, under the action of small doses of digitalis, is at first made to beat somewhat more strongly and rapidly; but as soon as its action upon the pneumogastric becomes manifest, in larger and increasing doses, the heart action becomes more powerful and is somewhat slowed; and in full medicinal doses, frequently used in medicine when the effects of digitalis are desired, the action of the heart is much stronger and considerably slowed. The blood-pressure is high, and the arteries are contracted. If, however, the use of digitalis is pushed beyond this point, its action as a paralyzant of the pneumogastric begins to be evident. By reason of this loss of the inhibitory action of the pneumogastric, the heart action at first is stronger, and the beat becomes more rapid. If still further toxic doses are given, the heart runs away, as it were. It beats very rapidly, irregularly, and with increasingly weakened force, until it finally stops exhausted. Digitalis also increases the secretion of urine; it raises the pressure of the blood vessels, and increases the amount of blood in all the organs of the body, including the heart itself. It is thus one of the great cardiac tonics, when used within physiological limits, and is indicated in most cases of heart disease where there is malnutrition caused by the dilatation of the chamber or a leakage of the valves.

Digita'ria, a genus of grasses, commonly called finger-grasses, now classed under the genus *Panicum*. See FINGER-GRASS.

Digitigra'da, a group of mammals in the obsolete system of Cuvier, comprising those like the dogs, cats, civets, weasels, rodents, etc., which have the metacarpals and metatarsals greatly lengthened, and the foot otherwise modified, so as to lift the heel off the ground. The animal consequently walks upon its toes (digits), an adaptation to the requirements of captivity and speed. This form of foot appears very early in the history of the mammalian class, but has reached its highest development in more modern forms. The opposite condition, in which the whole sole of the foot rests upon the ground, as in bears, man, and others, is called "plantigrade"; but some animals, as those of the raccoon family, are intermediate between plantigrade and digitigrade in their method of standing and walking. The term no longer expresses a scientific classification.

Dijon, dē-zhôṅ (ancient DIBIO), France, chief town in the department of Côte-d'Or, and formerly capital of the old duchy of Burgundy. It is 196 miles southeast of Paris. Its importance as a railway centre has rendered it of consequence in the inner line of French defenses. Pop. (1901) 70,428.

Dika, dē'ka, a vegetable fat obtained from the seed of a West African tree, *Irvingia barteri*, used in making fine soaps. It resembles cacao-butter, and makes very hard soaps. The tree belongs to the *Simarubaceæ*, and has alternate, entire leaves and drupaceous fruits.

Dikamali, dĭk-a-măl'ĭ, a resin exuding from Indian trees of the genus *Gardenia*, especially *G. lucida* and *G. gummifera*, a solution of which is used to dress wounds and open sores. These trees belong to the order *Cinchonaceæ*.

Dike, Samuel Warren, American reformer: b. Thompson, Conn., 13 Feb. 1839. He was graduated from Williams College in 1863; and from Andover Theological Seminary in 1866. He was subsequently ordained as a Congregational minister. He was the founder of the Divorce Reform League, now known as the National League for the Protection of the Family, and has been its corresponding secretary from the first. He also established the home department of the Sunday School. He has written numerous papers for periodicals on marriage, divorce, the family, etc.

Di'ke, in Grecian mythology, the avenger of wrong, and the rewarder of virtue. She is the daughter of Zeus and Themis, and is considered one of the Horæ.

Dike, or Dyke, a word variously used to represent a ditch or trench, and also an embankment, rampart, or wall. It is specially applied to an embankment raised to oppose the incursions of the sea or of a river, the dikes of Holland being notable examples of works of this kind. Owing to the possibility of great loss of property and of life, the punishment of all neglect or for malicious mischief to dikes is extremely severe. The dikes which protect the Netherlands and the German coasts of the North Sea go back to the old Roman times. Apparently even before the Romans appeared the Batavians at the mouth of the Rhine protected themselves by dikes. Drusus after the conquest of Holland, 10 B.C., built an elaborate system of artificial canals and dikes. Pliny the Elder gives interesting descriptions of the artificial hills which were erected as places of refuge during the floods.

Among the provinces in North and South Holland which have been protected by dikes may be mentioned the Province of Hanover, 618 miles, protecting 770,000 acres of marsh land. On the left bank of the Oder River there is a dike which protects more than 170,000 acres of land. The dike at the delta of the Vistula protects 134,000 acres of land. On the Lower Rhine, between the Weser and Holland are 115,000 acres protected by dikes. Along the Loire River are 280 miles protecting 230,000 acres. Along the Po there are 310 miles protecting 850,000 acres. In England there are 1,750,000 acres protected by dikes. Many of the dikes of Holland are raised 40 feet above high-water mark and are wide enough at the top for a general roadway or canal, sometimes for both.

In the United States the term dike is almost wholly restricted to the structures of more or less permanence built in various ways in the bed of a stream to regulate its flow, narrow the low water cross section, concentrate the current, increase its local scouring effect and thereby deepen the river channel. The earthen embankments designed to restrain the flood waters are called levees. The most notable examples are found along the Mississippi River. These levees are placed some little distance back from the river, and according to the local conditions vary in height from 2 or 3 feet to over 20 feet. Levee building began many years ago along the lower part of the river and it has been carried on practically continuously ever since. Up to June 1900 the United States had

expended more than $15,000,000, and the various levee boards had expended between 1882 and 1900 more than $22,000,000. The length of the levee lines along the Mississippi River in 1900 was about 1,300 miles, and the area protected from overflow about 27,000 square miles. In the existing levees there were about 140,000,000 cubic yards of earth, and to complete the system and make the levees safe against the maximum possible flood would require about 120,000,000 cubic yards in addition, which it was estimated would cost about $20,000,000. See Reservoirs.

Dike. In geology, a dike is any elongated and relatively narrow body of igneous rock that was forced while molten into a fissure and hardened there. The rocks cut by the fissure may be either sedimentary or igneous, and a dike may be from a few inches to a hundred feet thick. Dike rocks, especially in thin dikes, have usually a compact texture due to the quick cooling. Quartz, porphyry, and basalt are the commonest dike rocks. Dikes are to be distinguished from veins which are fissures filled with minerals (quartz, calcite, etc.) deposited from solution; but some dikes of rocks containing much silica were deposited from igneous solutions containing the vapor of water, hydrochloric acid, etc., and such dikes may grade insensibly into true quartz veins. Dikes are of common occurrence in all regions of volcanic action and in mountain ranges, and as all manner of chemical changes may take place along the contact of a dike with the rock it cuts, dikes are often of importance in determining ore deposits. A well-known example is the relation of the iron ore bodies in many of the great mines of the Lake Superior region to the diabase dikes. So called sandstone dikes, found in California and elsewhere, represent fissures that have been filled in some way with sand. They are not true dikes. See Diabase; Ore Deposits; Quartz; Porphyry; Volcano.

Dikoa, dē-kō'a, Africa, a town in the northwestern part of Kamerun, about 25 miles south of Lake Chad. It is fortified and was at one time the residence of the ruler of the native kingdom of Bornu. Pop. 15,000 to 25,000.

Dilatation. See Heart-disease.

Dilem'ma (from Gr. *dis*, twice, and *lēmma*, an assumption), in logic, an argument in which the same conclusion may be drawn from two contrary propositions. A person is said to be in a dilemma, or on "the horns of a dilemma," when each of several courses of action would lead to an unsatisfactory result. We append one of the most famous of the classical dilemmas. A young rhetorician said to an old Sophist: "Instruct me in pleading and I shall pay you when I gain a cause." The master sued for the reward, and the scholar eluded the claim by a dilemma. "If I gain my cause I shall not pay you, because the award of the judge shall be against you. If I lose it I may withhold it, as I shall not have gained a cause." The master replied: "If you gain you must pay me, because you promised to pay me when you gained a cause; if you lose you must pay me, because the judge will award it." When the case came before the judges they were unable to decide it. See Logic; Paradox; Syllogism.

Dilettante, dī-lĕt-tän'tā, an Italian expression; in its original sense signifying a lover of the arts and sciences, who devotes his leisure to them as a means of amusement and gratification. The term was originally applied to a lover of Italian vocal music, and was at one time the name of a party which upheld the superiority of that class of music. In contemporary usage the word has come to mean more or less of an artistic trifler. In 1734 a number of gentlemen founded a Dilettanti Society in London, with the object of combining social intercourse with the cultivation of artistic knowledge. On the rapid accumulation of the funds, the members resolved, in 1764, to send out an expedition to collect details and drawings of the most remarkable artistic monuments of antiquity. Messrs. Chandler, Revett, Stewart, and Pars accordingly were sent to Asia Minor, and returned with the materials for the splendid work on Ionian Antiquities, published at the expense of the society, the first volume of which was issued in 1769: a second volume was published in 1797, and a third in 1840. Among other works published by the society are: 'Specimens of Ancient Sculpture, Egyptian, Etruscan, Greek, and Roman' (two vols. imp. folio; London 1809, 1835); the 'Unedited Antiquities of Attica' (imp. folio; London 1817); the 'Temples of Ægina and Bassæ' by C. R. Cockerell (folio; London 1860).

Diligence, the name originally given in French-speaking countries to a public conveyance of the nature of a stage-coach. The name was also adopted by other countries for their public carriages. The French diligence was a national vehicle going over regular routes periodically. It was a huge, heavy, cumbersome affair, upon four broad wheels which never covered a greater distance than six miles an hour. It had three compartments designed for the same number of classed passengers. Two officials accompanied the diligence on its trip; a *postillon*, who managed the horses, and a *conducteur*, who looked after the passengers and their traps.

Dilke, Sir Charles Wentworth, English politician: b. London 18 Feb. 1810; d. St. Petersburg, Russia, 10 May 1869. He was the son of C. W. Dilke (q.v.). One of the most active originators, as well as member of the executive committee of the Great Exhibition of 1851, he was sent in 1851 as a commissioner to the New York Industrial Exhibition, and in 1862 was one of the five royal commissioners for the second exhibition. In 1865 he was returned to Parliament for Wallingford, and in 1869 was sent to Russia as the representative of England, to the horticultural exhibition held at St. Petersburg. He was knighted in 1862.

Dilke, Sir Charles Wentworth, English writer and politician: b. Chelsea 4 Sept. 1843. He is a son of the preceding; was educated at Trinity Hall, Cambridge, and was shortly afterward called to the bar. His first work, 'Greater Britain,' the result of a tour round the world in 1866–7, became very popular. In 1868 he was elected M.P. for Chelsea, and he represented this constituency up to 1885. From 1880 till 1882 he was under-secretary for foreign affairs, and from 1882 till 1885 president of the local government board. After a few years'

retirement he became M.P. for Forest of Dean division of Gloucestershire in 1892. Sir Charles has played a not unimportant part in connection with various legislative measures. 'The Present Position of European Politics' (1887); 'The British Army' (1888); 'Problems of Greater Britain' (1890); and 'Imperial Defense' (with Spencer Wilkinson, 1891); 'British Empire' (1898); are among his works.

Dilke, Emilia Frances Strong, LADY, English art critic: b. Ilfracombe 2 Sept. 1840; d. Oct. 1904. She was married to Mark Pattison in 1862 and to Sir C. W. Dilke (q.v.) in 1885. She was for many years a writer for the 'Saturday' and 'Westminster' reviews, and at one time art critic of the 'Academy.' Her chief work is 'The Renaissance in France' (1879). Her other publications include: 'The Shrine of Death' (1886); 'Art in the Modern State' (1888); 'The Shrine of Love and Other Stories' (1891); 'French Painters of the 18th Century' (1899); 'French Architects and Sculptors of the 18th Century' (1900); 'French Decoration and Furniture in the 18th Century' (1901).

Dill, James Brooks, American corporation lawyer: b. Spenceport, N.Y., 25 July 1854. He was graduated at Yale in 1876, and from the law school of the University of the City of New York 1878. He has drafted, in whole or in part, the charters of more than 700 corporations and has written various monographs on matters connected with corporation law, among them: 'The Advantages of Business Corporations.' It was at his suggestion that New Jersey adopted the Corporation Registration Law, which gave New Jersey corporations the same protection afforded by the English system. See CORPORATIONS.

Dill (*Anethum graveolens*), the common name for an aromatic plant of the carrot family (*Umbelliferæ*). It is a native of Spain, but has been naturalized throughout the civilized world, where the climate is suitable for its growth. It is a particular favorite with the German people, who use it to flavor cucumber pickles, and therefore try to raise it wherever they may be living. In England it is used for the manufacture of gin, and to a small extent in medicine, as a carminative for children. An East Indian species is one of the ingredients in curry powder. It is a hardy biennial plant, growing upright. It has a single slender stem, and leaves finely divided or pinnatifid. The flowers, which form an umbel, appear in June or July. The seed is of an oval form, convex on one side, flat on the other, having three striæ on the outside, and surrounded with a small membranous border. Its taste is slightly acrid, and its odor stronger but less pleasant than that of fennel, to which it is closely allied. In America, where found out of gardens, it is a fugitive from cultivation, and is generally called fennel.

Dilleniaceæ, dil-lē-nī ā'sē-ē, an order of plants nearly related to the *Ranunculaceæ*, found chiefly in Australia, Asia, and the warm parts of America. Sepals five, persistent; petals five, deciduous, in a single row; seeds universally arillate; stamens indefinite, hypogenous. The species are trees, shrubs, or under-shrubs. The Indian species are remarkable for their beauty, the grandeur of their foliage, and the magnificence of their flowers. They have astringent properties, and some of the species afford excellent timber. Lindley enumerated 26 genera, comprising 200 species.

Dillenius, dil-lā'nē-oos, or **Dillen, Johann Jakob,** yō'hän yä'kōb, German botanist: b. Darmstadt 1687; d. Oxford, England, 2 April 1747. He was distinguished for his investigations into the propagation of plants, particularly cryptogamous plants. In 1721 he went to England, where he published several works, and particularly 'Hortus Elthamensis' (1732), in which the drawings, prepared by himself, are distinguished by the greatest faithfulness. His last work, on the mosses, 'Historia Muscorum,' added much to his reputation.

Dillingham, William Paul, American statesman: b. Waterbury, Vt., 12 Dec. 1843. He studied law, was admitted to practice in 1867, and was state attorney, Washington County, Vt., 1872–6. He was a member of the Vermont legislature 1876 and 1884; state senator 1878 and 1880; commissioner of State taxes 1882–8, and governor of Vermont 1888–90. Since 1890 he has been president of the Waterbury National Bank. He was elected United States senator in October 1900 to fill a vacancy caused by the death of Justin S. Morrill.

Dillmann, dil'män, **Christian Friedrich August,** German Orientalist: b. Illigen, Würtemberg, 25 April 1823; d. 4 July 1894. In 1854 he accepted a call to Kiel, where he became professor of Oriental languages in 1860, but was transferred in 1864 to the chair of Old Testament exegesis at Giessen, which in 1869 he resigned to become Hengstenberg's successor at Berlin. Dillmann was beyond question the first authority in Europe on the Ethiopic languages. The best books for the student in this department of learning are his: 'Ethiopian Grammar' (1857); 'Ethiopian Dictionary' (1865); and his 'Ethiopian Selections' (1866). Other works (1879–84) deal with the history of the Ethiopic kingdom of Axum.

Dillon, John, Irish politician, son of John Blake Dillon, who was a prominent member of the Young Ireland party, and member of the British Parliament for County Tipperary in 1865–6: b. New York 1851. He early identified himself with the Parnellite movement, and in 1880 was elected to Parliament for County Tipperary. In the House of Commons Dillon soon became prominent for the violence of his language, while speeches delivered by him in Ireland led to his imprisonment in 1881, 1881–2, and 1888. From 1883 to 1885 he was absent from political life on account of ill-health; but in the latter year he reappeared and was elected for East Mayo. He was one of the most prominent promoters of the "Plan of Campaign." In 1896 he succeeded Justin M'Carthy as chairman of the main section of the Nationalist Party.

Dillon, John Forrest, American lawyer: b. Montgomery County, N. Y., 25 Dec. 1831. Going to Iowa in early youth, he was graduated at the medical department of Iowa University, but soon gave up medical practice and studied law, being admitted to the bar in 1852. He was State prosecuting attorney 1852–8; judge of the supreme court of Iowa 1863–9; and judge of the United States circuit court, 8th judicial

district, 1860–70, when he resigned. From 1879–82 he was professor of real estate and county jurisprudence in Columbia Law School, and has since then practised law in New York, being general counsel of the Missouri Pacific Railway Company; and the Western Union Telegraph Company; and consulting counsel of the Manhattan Elevated and Pacific Railway companies. Among his works are: 'United States Circuit Court Reports'; 'Municipal Corporations'; 'Removal of Causes from State to Federal Courts'; 'Municipal Bonds'; and 'Laws and Jurisprudence of England and America.'

Dilman, dēl'man, Persia, city in the province of Azerbijan, 75 miles west of Tabreez. It is of considerable extent, and is surrounded by gardens. Pop. estimated at 10,000.

Dilolo (dē-lō'lō) **Lake**, a small body of water in Central Africa, discovered by Dr. Livingstone (1854). Its altitude is nearly 5,000 feet above the sea. It is supposed to be connected with both the Zambesi and Congo rivers.

Dil'uents, remedies that increase the proportion of fluid in the blood. They are employed in fevers to lessen thirst and increase secretion, and are used in certain acrid affections of the stomach and intestinal regions. Water is the only real diluent, though it may be given in various forms — soups, barley-water, toast-water, milk, lemonade.

Dilu'vium, a term first used by the English geologist Buckland in 1823, and applied by him to the deposits between the Tertiary system and those now in process of formation. He regarded them as the discharge from a universal flood. The diluvium thus includes the boulders, sands, and clays which Lyell included under the name Pleistocene and Morlot under the name Quaternary. Though the term diluvium is no longer used, the adjective diluvial is still employed, especially by foreign geologists. See Glacial Period; Pleistocene; Quaternary.

Dime (Fr. *dime*, contraction of *dixième*), a silver coin of the United States, of the value of 10 cents, or one tenth of a dollar. It was first coined in 1796 in pursuance of the act of 2 April 1792, though pattern pieces were struck in 1792. Its legal standards have been as follows: by act of 2 April 1792 fineness 892.4 thousandths, weight 41.6 grains; by act of 18 Jan. 1837 fineness 900 thousandths, weight 41¼ grains; by act of 21 Feb. 1853 fineness 900 thousandths, weight 38.4 grains. See Coin; Numismatics.

Dimensions, a term used in physics in expressing the mode of dependence of a secondary unit upon the fundamental units from which it is derived. Thus the volume of a rectangular solid is found by multiplying the length by the breadth, and this product again by the thickness; or, in other words, by forming a product that is composed of three factors, each of which is a length. This is expressed, in the terminology of modern physics, by saying that volume (or "bulk") is of the "dimensions" L^3; or that it is of dimensions $+3$ in length. Similarly, the speed with which a body is moving is found by dividing some particular distance that is traversed by the body, by the time that is required to traverse it. The "dimensions" of speed are therefore said to be LT^{-1}; or speed is said to be of dimensions $+1$ in length, and -1 in time. Three fundamental units are required in order to express the ordinary units of mechanics in this way. Some latitude is possible in their selection, but most writers adopt (1) a definite mass, (2) a definite length, and (3) a definite interval of time. An example of a mechanical unit that contains all three of these units is afforded by energy. The kinetic energy of a body is found by multiplying a mass by the square of a velocity; and hence the dimensions of energy are expressed by the formula ML^2T^{-2}, so that energy is of the dimensions $+1$ in mass, $+2$ in length, and -2 in time. As an example of the determination of the dimensions of a quantity by indirect means, force may be considered. Work is defined as the product of force and distance; so that it may be written FL. Now energy, since it is capable of becoming transformed into work, must be of the same dimensions as work; and hence we must have $FL = ML^2T^{-2}$, from which it is easily seen that $F = MLT^{-2}$. In other words, force is of dimensions $+1$ in mass, $+1$ in length, and -2 in time. The correctness of this result is easily verified by direct calculation. Thus momentum, being the product of a mass by a velocity, is of the dimensions MLT^{-2}; and since force is measured by the increase of momentum that it can produce in a given time (or, in other words, force is determined by dividing a given change of momentum by the time required to produce that change), the dimensions of force must be $MLT^{-1} \div T = MLT^{-2}$, which is identical with the result previously obtained. The theory of dimensions is of great importance in connection with problems involving a change of the fundamental units from one system to another; as, for example, in translating the values of physical quantities that have been determined in the metric system, into their equivalents as expressed in the system of units in use in England and the United States. For these important applications, and for the extension of the fundamental principles to the discussion of problems in electricity and magnetism, consult J. D. Everett, 'Units and Physical Constants.' See Units.

Dimet'rodon, a primitive reptile of the Permian period in which the neural spines of the vertebræ are greatly elongated, making a high rigid fin on the back. The teeth indicate carnivorous type habits, and the animal appears to have been terrestrial or amphibious. In the allied *Naosaurus* a series of short cross-spines project on each side from the neural spine, like the yards of a ship from the masts. The use of this very curious structure is quite unknown. The animal attained a length of 10 or 12 feet.

Dimin'utive, in grammar (Latin, *diminutivum*), a word formed by adding a suffix conveying the idea of littleness and other connected ideas, as tenderness, affection, contempt, etc. The opposite of diminutive is augmentative. In Latin, diminutives almost always ended in *lus*, *la*, or *lum*; as *Tulliola, meum corculum*, little Tullia, my dear or little heart.

The Italian is particularly rich in diminutives and augmentatives: *ino, etto, ello*, convey the idea of smallness, dearness, etc.; *one*, of largeness; *uccio*, sometimes of smallness, with reproach, but often without it; *accio* signifies that the thing is disgusting, unpleasing, etc.; for

example, *casa* is a house; *casetta, casina, casella,* a small house, nice little house; *casone,* a large house; *casuccia,* a small, insignificant house; *casaccia,* an ugly house. That expressive tongue can compound two or three of these endearing affixes; and travelers may frequently hear little Italian children form almost endless words, as if overflowing with tenderness; for instance, *fratellinucciettinctto.* Adjectives also can receive the diminutive termination; as *carino, carinuccio,* from *caro.* In Spanish there are similar diminutives, augmentatives, and other affixes. Thus from *hombre,* a man, are formed the augmentatives *hombron, hombrazo, hombronazo, hombrachon;* and from *muger,* a woman, *mugerona, mugeraza, mugeronaza.* Diminutives in *ito* and *ico* usually denote endearment or tenderness, as those in *illo* do sometimes; those in *clo* always denote contempt. In Portuguese the diminutives and augmentatives correspond to those of the Spanish language. In French there are many diminutives formed from other words; as, *tablette,* of *table, charette* of *char;* but there is no general affix which can be added to every substantive. The German has the syllables *chen* (in Low German, *ken,* with which corresponds the English *kin,* as in *manikin,* and some other words), *lein* and *el,* for substantives; *lich,* etc., for adjectives; *lich* corresponds to the English *ish* or *like;* for instance, *rundlich,* roundish or roundlike (from *rund,* round). The German even adds the diminutive to pronouns, and nurses will sometimes say *duchen,* from *du,* thou.

The English language affords examples of diminutives, but has no affix which can be used at pleasure to convey this idea. Those commonly used are *ock, kin, el, ling,* and *et;* as in bullock, lambkin, kernel, gosling, and tablet. Diminutives of proper names are also formed, in colloquial and familiar language, by adding *y* or *ie* to the names, as *Charley, Johnny,* etc.

Dimitry, Charles Patton, American novelist: b. Washington 31 July 1837. He was educated at Georgetown College, and after serving as a private in the Confederate army, was connected with newspapers in several cities of the North and South. He is State historian of the Louisiana Society of the American Revolution. Among his works are: 'Guilty or not Guilty'; 'Angela's Christmas'; 'Gold Dust and Diamonds'; 'The House in Balfour Street'; 'Louisiana Families'; 'Louisiana Story in Little Chapters.'

Dimitry, John Bull Smith, American author and editor: b. Washington, D. C., 27 Dec. 1835; d. New Orleans 7 Sept. 1901. He entered the Confederate army of Tennessee in 1861, serving till 1864, being wounded at the battle of Shiloh. He resided in the United States of Colombia 1874–6, filling the position of professor of languages in the Colegio Caldas, Barranquilla. He was long connected with the press, being for seven years dramatic and literary editor of the New Orleans *Times,* and wrote a 'History and Geography of Louisiana,' which has been used as a text-book.

Dimity (Gr. *di-* double, *mitos,* thread; literally, made with a double thread), a stout cotton fabric, ornamented in the loom either by raised stripes or fancy figures: stripes are the most common, as the mounting of the loom is much simpler and the texture can be produced at less expense. It is rarely dyed, but usually employed white, as for bed and bed-room furniture. There is also a much finer cotton stuff on the market to-day which is manufactured for summer-dress material.

Dimmesdale, dĭmz'dāl, **Arthur,** the erring clergyman in Nathaniel Hawthorne's tale, 'The Scarlet Letter' (q.v.).

Dimor'phism (from the Gr. *dimorphos,* of double form), in crystallography, the crystallization of a body in forms belonging to two different systems, or in incompatible forms of the same system. In biology, the occurrence of individuals of the same species in such a form, that, were not their relation known, they might be considered as separate and distinct in species and even in genera. Thus, in sexual dimorphism, the male and female of the same species present distinct characters, the male may be winged, the female wingless.

Dimor'phodon, a genus of Lias bird-like reptiles, found in the south of England. The large head has powerful jaws, with large anterior teeth which are pointed, and small posterior teeth which are lancet-shaped. This is the earliest of the reptiles that were capable of flight. See PTERODACTYL.

Dimsdale, Thomas, English physician: b. Essex 6 May 1712; d. Hertford 30 Dec. 1800. He published: 'The Present Method of Inoculation for the Smallpox' (1767). He was famous as an inoculator, making journeys in 1768 and 1784 to Russia to inoculate the Empress Catharine and other magnates.

Dinah Morris, the heroine of George Eliot's novel, 'Adam Bede' (q.v.). She is a factory girl and at the same time a lay preacher whose purity, spirituality, strength, and tenderness have an uplifting influence on all who come in contact with her. The beauty of her character is especially developed in her intercourse with the guilty and condemned Hetty Sorrel (q.v.). Elizabeth Evans, an aunt of George Eliot, appears to have been the original from whom the character was drawn.

Dinajpur, dē'näj-poor, or **Dinagepore,** India (1) A district in the Rajshahi division. Area 4,118 square miles; pop. 1,555,835. (2) A city and capital of the district, 205 miles north of Calcutta. Pop. 12,204.

Dinan, dē-näṅ (ancient DINNANUM, fortress on the water), a town in the department of Côtes-du-Nord, France, 16 miles south of St. Malo. It is noted more for its trade than for its manufactures. Pop. 10,000.

Dinant, dē-näṅ or dē-nänt', Belgium, a town in the province of Namur, on the Meuse, 14 miles south of the city of Namur. It was fortified as early as the 12th century. In 1466 Philip the Good, Duke of Burgundy, besieged it with 50,000 men; and having taken it by assault, razed it to the ground, and threw 800 of its inhabitants, tied in pairs, back to back, into the Meuse. Paper-mills, tanneries, breweries, and bake-shops are the chief industries. It is noted for its gingerbread made of rye flour and honey. Pop. 7,208.

Dinapac, dē-nä-păk', or Guinapak, Rocks, Philippines, two tower-like rocks, lying east of Camiguin Island, north of Luzon. On 2 Nov. 1899, the United States ship Charleston struck an uncharted coral reef three miles north of

Dinapore Rocks and was totally wrecked. All signs of the wreck disappeared in a heavy typhoon a few weeks later.

Dinapur, dē-nä-poor, India, a city in the district of Patna, on the Ganges, about 12 miles northwest of Patna. It is one of the great stations of the British army in India. Pop. 44,419.

Dinar, dē-nar' or dī'nėr (Lat. *denarius*), formerly an Arab gold piece weighing about 65.4 grains troy. Also a Persian coin. It is now the name of the chief Persian coin, value one franc.

Dinar'chus, Greek orator: b. Corinth 361 B.C.; d. Athens 291 B.C. He studied under Theophrastus, and was most successful during the reign of Demetrius Phalereus. After the fall of Demetrius he fled to Chalkis, and returned to Athens in 292 B.C. Of his speeches, of which there were probably about 60, only three are preserved, one of them directed against Demosthenes.

Dinar'ic Alps, the name applied to the mountains connecting the Julian Alps with the Balkan system. The main range stretches from northwest to southeast, separating Dalmatia from Bosnia and Herzegovina, as far as the mouth of the Narenta. The mountains are principally calcareous; the highest summits are Orjen 6,225 feet, and Dinara 5,940 feet.

Dinas Bricks are highly valued on account of their refractoriness or infusibility. They are made of a peculiar rock, containing 98 per cent of silica, with a little alumina, which occurs at Dinas in the vale of Neath, Wales. This fireclay brick is very highly esteemed on the other side of the Atlantic. An imitation of it is made in Austria from quartz rock.

Dincklage-Campe, dĭnk'läg-ĕ-käm'pĕ, **Amalie (Emmy) von**, German novelist: b. Campe, Osnabruck, 13 March 1825; d. Berlin 28 June 1891. Her first novel, 'The Loving Old Couple,' was published in 1857. Though she traveled extensively and observantly in Europe and America, her themes for stories were nearly all from her own countryside; and she is called "the poetess of the Ems valley." Among her works are: 'The School of the Heart'; 'Tales of Home'; 'Pictures of Emsland'; (posthumously) 'Poems'; a story, 'The Woman Nihilist' (1893).

Dindigal, India, a city in the Madura district, Madras, with a fort on a rocky height. It manufactures cigars, and trades in tobacco and coffee. Pop. 20,203.

Dindings, dĭn-dĭngz', The, a British possession belonging to the Straits Settlements, consisting of two small islands and a strip of land on the coast of Perak on the west side of the Malay Peninsula; area about 200 square miles. See STRAITS SETTLEMENTS.

Dindorf, Wilhelm, vĭl'hĕlm dĭn'dōrf, German classical scholar: b. Leipsic 2 Jan. 1802; d. there 1 Aug. 1883. He became in 1828 professor of literary history at Leipsic, but resigned in 1833 in order to devote himself entirely to literary work. He contributed to the edition of Aristophanes by Invernizzi and Beck (1820–34), and between 1835 and 1830 published at Oxford an edition of the same poet. Other works by him are editions of Æschylus (1841–51); Euripides (1834–63); Sophocles (1832–6); and Demosthenes (1846–51); 'Lexicon Sophocleum' (1871); 'Lexicon Æschyleum' (1873–6); and a new edition of Stephens' 'Thesaurus Linguæ Græcæ' (1831–65).

Dindymene. See CYBELE.

Dingelstedt, Franz von, frănts fŏn dĭng'ĕl-stĕt, BARON, German poet and dramatist: b. Halsdorf, Upper Hesse, 30 June 1814; d. Vienna 15 May 1881. His 'Songs of a Cosmopolitan Nightwatchman' (1841) shocked all officialdom, but had a great popular success; and his 'Poems' (1845) showed true poetic feeling and great descriptive power, the latter also visible in his travel sketches and stories; one of the most successful of the latter is 'The Amazon,' a society novel. His tragedy, 'The House of the Barneveldts' (1851) was a splendid success. He adapted plays from Molière, Shakespeare, and others, to the German stage, and wrote a volume of 'Studies and Copies After Shakespeare.'

Dingle, Philippines, a city of Panay, in the province of Iloilo; on Jalaur River, 18 miles north of the city of Iloilo. Pop. 11,000.

Dingler, Johann Gottfried, yō'hän gŏt'frēd dĭng'lĕr, German chemist: b. Zweibrücken 2 Jan. 1778; d. Augsburg 19 May 1855. From 1806 to 1820 he conducted journals for calico printing, dyeing, and bleaching, and in 1820 began the well-known periodical called after him 'Dingler's Polytechnic Journal,' which at the time of his death had reached the 140th volume. The journal he founded still continues.

Dingley, Nelson, American legislator: b. Durham, Maine, 15 Feb. 1832; d. Washington, D. C., 13 Jan. 1899. He was graduated from Dartmouth College in 1853; admitted to the bar in 1856; purchased the Lewiston 'Journal' in 1856; edited a daily edition in 1865; and was its editor and proprietor till his death. He was elected to the State legislature in 1861; served in that body till 1865 and in 1868 and 1873, and was speaker of the House in 1864–5. He was elected governor of Maine in 1873, and re-elected in 1874; and was a member of Congress from 1881 till his death. From the beginning of his congressional career he was conspicuous as an advocate of the principle of protection and was author of the Dingley Bill (q.v.) of 1897. In 1898 he was appointed a member of the Joint High Commission.

Dingley Bill, The, in American history, a tariff law, enacted by Congress in 1897, and so named after Nelson A. Dingley who introduced the bill. The Dingley Bill was a revision of the Wilson and McKinley bills and increased the customs duties on wearing apparel and manufactured goods generally. See UNITED STATES — TARIFF IN THE.

Dingo, the Australian wild dog (*Canis dingo*), the only species of dog known to exist in both the wild and the domesticated states. It is sometimes considered as being of Asiatic origin, the theory being that it was brought to Australia by the first men who came there, and that it has since become wild. It is not found in Tasmania or New Zealand, in which the fauna is generally like that of Australia. The dingo has decreased in numbers, retreating before the advance of civilization, and suffering from the war made upon it by the settlers, whose flocks it preys upon. The animal is about two

and a half feet long, and nearly two feet high; has large erect ears and a bushy tail. It is tawny in color; some specimens, however, being pale and others almost black. In the wild state it is especially crafty and courageous, and hunts in packs sometimes containing 100 dogs. The native Australians seek the young dingoes, and having taken them from the lairs where they are found, bring them up as domestic animals. When well treated they are affectionate and trustworthy, and are used to help their masters in hunting the animals on which the natives live — opossums, snakes, lizards, etc. While the domesticated dingo is his friend and companion, the native Australian will hunt the wild dog, kill him, and having roasted him, will eat him with a keen appetite. Consult: Lydekker, 'New Natural History,' Vol. I. (1897). See Dog.

Dingrás, Philippines, city in the province of Ilocos Norte, in Luzon, 11 miles southeast of Laoag. It is on the Grande de Laoag River. The surrounding country is fertile. Pop. 12,600.

Dinichthys (Gr. *δεινός*, terrible; *ἰχθύς*, fish), a genus of enormous fossil fishes found in Carboniferous and Devonian rocks. They are usually classed with the Dipnoi (q.v.) as members of the order *Arthrodira.*

Dinic'tis, a genus of sabre-tooth tigers of the Oligocene Epoch in North America. The animal was as large as a Canada lynx, and of somewhat the same proportions, but with long tail. Its teeth were less specialized than in the later sabre-tooth tigers or the modern cats, 34 being retained out of the 44 which all primitive mammals possessed. It has many characters allying it with the civets (*Viverridæ*), and especially with the fossa (q.v.) of Madagascar, indicating the descent of cats and civets from a common ancestor.

Diniz, dē'nēs, **Julio,** pseudonym of **Joaquim Guilherme Gomes Coelho,** Portuguese novelist and poet: b. Oporto 14 Nov. 1839; d. there 12 Sept. 1871. He introduced the village story into Portuguese literature. His first work: 'The Rector's Wards' (1866), is also his best; it was followed by 'An English Family' (1867), describing middle-class life in Oporto. His poems were published in 1880.

Diniz da Cruz e Silva, Antonio, än-tō'nē-ō dē'nēs dä kroos ē sēl'vä, Portuguese poet: b. Lisbon 4 July 1731; d. Rio Janeiro, Brazil, 5 Oct. 1799. A lawyer and official, in 1776 he was made counsel to the superior court at Rio Janeiro. He was one of the founders of the celebrated literary society, the Lisbon Arcadia. His poetry comprises sonnets, eclogues, elegies, songs, epigrams, epistles, and several volumes of Pindaric odes; a lengthy poem, 'Brazil's Metamorphoses'; and a heroicomic epic, 'Hyssop,' — modeled on Boileau's 'Lutrin,' but a spirited, original composition, far superior to Boileau's, — which was republished several times in France, and translated into French prose.

Dinka, a powerful tribe of Negritos who live on both sides of the White Nile between lat. 6° and 12° N. Their territory covers 60,000 square miles. They are intelligent, have some skill in making articles for household use, and also follow agriculture. Each village is governed by its own chief. Consult: Schweinfurth, 'In the Heart of Africa.'

Dinkard (the enactments of religion), an important compilation of information concerning the doctrines, customs, and writings of the religion of Zoroaster. In its present form, much of the work is a descriptive list of the contents of a larger and earlier work.

Dinocer'ata (Gr. *δεινός*, terrible, and *κέρας*, horn), an extinct order of mammals, approaching the elephant in size and movements, remains of which have been found extensively in the Eocene lacustrine sediments of southern Wyoming. The dinocerata include three genera — *Uintatherium* (most primitive type), *Dinoceras* (intermediate form), and *Tinoceras* (youngest and most specialized). About 30 more or less distinct forms have been recognized.

Dinorah, dē-nō'rä, the title of an opera by Meyerbeer, produced in Paris 4 April 1859. The opera is now rarely presented. Its single effective scene is a shadow dance, with accompanying song.

Dinor'nis, a genus of large wingless birds, classed among the *Struthionidæ* or ostrich tribe, the fossil bones of various species of which have been found in New Zealand. These birds had bones devoid of air-passages, were three-toed, and some of them must have been of immense size. The *D. giganteus,* for example, is estimated to have been about 12 feet tall. See Dinornithes.

Dinornithes. A group of extinct, flightless, ratite birds of gigantic size, the moas of New Zealand, with small heads, stout legs, usually with a hallux, wings absent or extremely reduced, furculum absent, and aftershafts large. The genera were *Dinornis Pachyornio, Mesopteryx, Anomalopteryx* and *Megalopteryx.* See Moa.

Dinosauria, dī-nō-sâ'rĭ-ạ, an extinct order of *Reptilia,* with many characters allying them to birds in the structure of the skull and skeleton. The body was covered with scales or bony plates, the limbs long and stilted, the tail massive, and equaling or exceeding the rest of the body in length. Many of them were of gigantic size, beyond that of any other land animals living or extinct, and exceeded only by the whales. During the Triassic, Jurassic, and Cretaceous periods, this group was the dominant form of terrestrial life, occupying the same relative position as did the mammalian quadrupeds during the Tertiary, or as does man at present. The most ancient known dinosaurs of the Triassic Period were carnivorous land animals of moderate size, and comparatively light and agile; later appeared huge, massive herbivorous quadrupedal and bipedal types, some scale-covered, others with heavy bony plates, spines, horns, and frills to protect them against their carnivorous enemies. They disappeared at the close of the Cretaceous Period, leaving no descendants or near relatives. Like other reptiles, they appear to have been cold-blooded, slow-moving, and unintelligent compared with the mammals which succeeded them, and less able to adapt themselves to the new conditions of life brought about by gradual changes of climate during geologic time. Their extinction paved the way for the predominance of the mammals and their evolution into the various modern races.

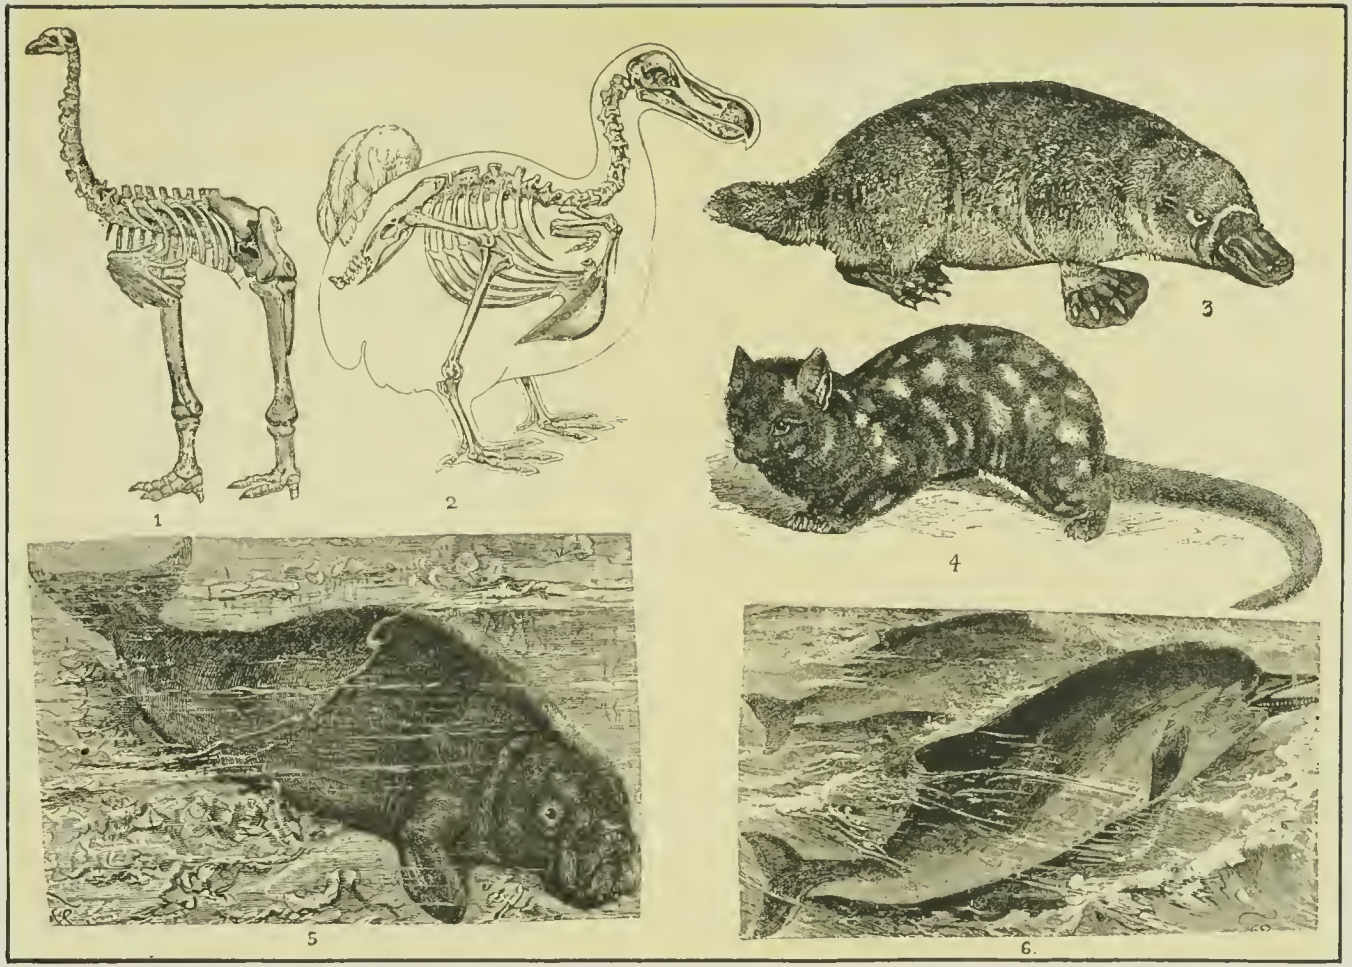
Dinosaurs are divided into three or four orders or sub-orders of very diverse appear-

ance. (1) *Sauropoda*, or amphibious dinosaurs, quadrupedal, herbivorous, with long neck, small head, weak teeth, short elephantine five-toed feet, and blunt claws. These have been found only in Jurassic and Lower Cretaceous strata, and include the largest members of the sub-class. *Brontosaurus*, *Diplodocus*, *Camarasaurus*, and *Morosaurus* are the best known. (2) *Theropoda*, or carnivorous dinosaurs, bipedal, carnivorous, with sharp teeth, bird-like hind legs and feet, three-toed or four-toed, and large sharp claws on both fore and hind feet. It includes *Megalosaurus*, *Allosaurus*, etc. (3) *Predentata*, or beaked dinosaurs, herbivorous terrestrial hoofed types with the front of the jaws covered by a horny bill or beak. These include the most highly specialized and bizarre forms, and were the latest development of the order, found chiefly in the Cretaceous Period. They are divided into three groups: (a) *Iguanodonta*, unarmored, bipedal, with small fore limbs and three-toed bird-like feet (but with hoofs instead of claws). *Iguanodon*, *Claosaurus*, and *Hadrosaurus* are the best known, each about 30 feet long. The skull of *Hadrosaurus* is four feet in length, and behind the horny beak is a magazine of several rows of small rod-like teeth set on end close together and wearing to a tessellated grinding surface like a mosaic pavement. (b) *Stegosauria*, heavy, quadrupedal, with five-toed elephantine feet, small head, large projecting bony plates on the back, and stout spines on the tail. The teeth are small and weak, somewhat like those of the iguana. *Stegosaurus* is the best known. (c) *Ceratopsia*, heavy, quadrupedal, with elephantine feet and very large head, with enormous horns projecting forward, and a great bony frill projecting backward and upward, and completely covering the short thick neck. The skull of *Triceratops* is sometimes eight feet long. The teeth of the *Ceratopsia* are like those of the iguanodonts, but larger and with fewer rows.

The brain in dinosaurs was disproportionately small, especially in the herbivorous types, and indicates a lower order of intelligence than in most modern reptiles. It is greatly exceeded in size by the spinal ganglia in the sacrum which govern the reflex (automatic) movements of the hind limbs and tail. Hence we may infer that the actions of these creatures were largely automatic and unintelligent, and this explains in part why they were unable to adapt themselves to the changes in physical geography, climate, and vegetation which ushered in the Cenozoic or modern era of geological time, and became totally extinct.

Comparatively little was known about the dinosaurs before 1880, but since that time the exploration and research of American paleontologists, and especially of the late Prof. O. C. Marsh in the fossil fields of Wyoming, Colorado, and other western States, have greatly extended our knowledge, and shown how important a part these creatures played in geological history. The proper collecting of these huge skeletons, and their extraction from the rock without injury, is a difficult and tedious operation, and requires considerable funds, so that only a few well-equipped museums have been able to afford it. The chief collections in this country are in the museums of Washington, New York, New Haven, Pittsburg, and Chicago. It is not yet practicable to trace the evolution of the different races of dinosaurs, as has been done with most of the mammal races, and much remains to be discovered as to the structure and habits even of the better known species.

W. D. Matthew,
American Museum of Natural History.



Dinotherium (Gr. δεινός, terrible; θηρίον, beast), a genus of elephantine mammals occurring as fossils in the Tertiary rocks of Europe and India, characterized by having the lower incisors developed into dome-curving tusks and by having all the molar teeth in use at once. They probably had a proboscis like that of the elephants.

Dinsmore, Hugh Anderson, American lawyer: b. Benton County, Ark., 24 Dec. 1850. He was clerk of the circuit court 1873–4, when he was admitted to the bar, and began practice in Fayetteville; was prosecuting attorney of the 4th judicial district of Arkansas in 1878–84; a Democratic presidential elector in 1884; minister-resident and consul-general in the kingdom of Korea in 1887–90; and a member of Congress in 1893–1903.

Dinwiddie, Robert, British colonial official: b. Scotland about 1690; d. Clifton, England, 1 Aug. 1770. He was lieutenant-governor of Virginia 1752–8; and during his official career recommended the annexation of the Ohio valley and the erection of forts to secure the western frontier against the French. He was one of the most earnest supporters of the French and Indian war, which began about 1753 and lasted 10 years.

Dinwiddie, William, American journalist and author: b. Charlottesville, Va., 23 Aug. 1867. When only 14 years of age, he was assistant electrician of the National Museum at Washington. He became inspector of customs at Corpus Christi, Texas, in 1883; was connected with the Bureau of American Ethnology from 1886 to 1895, at which time he went into journalism, serving as correspondent and illustrator for the New York *Herald*. He became photographer for the Baltimore & Ohio Railroad in 1897. During the campaign in Cuba and Porto Rico he served as war correspondent. He has published: 'Puerto Rico and Its Possibilities'; 'The War in the Philippines'; 'The War in South Africa.'

Dinwiddie Court-House and White Oak Road, Battles of. Gen. Grant, while besieging Petersburg, issued orders 24 March 1865 for a movement on the 29th to destroy the railroads leading into the city from the south, force Gen. Lee to come out of his entrenchments and fight on open ground, or so far attenuate his line that a successful assault could be made. The result was the battle of Five Forks (q.v.), the fall of Petersburg and Richmond, the surrender at Appomattox, 9 April and the close of the Civil War. The movement to the left was led by Warren's Fifth corps and Sheridan's cavalry, and the first encounter was near the Boydton road, where Warren's leading division (Griffin's) defeated two brigades sent out from Lee's right, driving them back to White Oak road. On the 30th the Second and Fifth corps closed in on the White Oak road on Lee's right, and Wilcox's Confederate division, coming out of the entrenchments, attacked Warren and was driven back. Warren's advance division was now within 600 yards of the road, and, on the

1. Skeleton of the Elephant-footed Dinornis.
2. Skeleton and Outline of the Dodo.
3. Duckbill (Ornithorhynchus anatinus).
4. A typical Paradoxure (Dasyurus viverrinus).
5. Manatee (Manatus americanus)
6. Dolphin (Delphinus delphis)

31st, Lee ordered another attack. Hunton's and Wise's brigades attacked in front, and McGavan's and Gracie's on the left flank. Ayres' and Crawford's divisions were driven back in disorder upon Griffin's division, which checked the Confederate advance. Gen. Miles, with two brigades of the Second corps, struck Wise's brigade on the left flank, drove it back with severe loss in killed and wounded, and the entire Confederate attacking party retreated, and Warren, resuming the offensive, pushed his advance across the White Oak road. It cost the Second and Fifth Union corps, on the 31st, 1,311 killed and wounded, and 556 missing.

Meanwhile Sheridan had reached Dinwiddie Court-House, 12 miles southwest of Petersburg, and on the 30th Devin's division and Davies' brigade were pushed 10 miles in advance in the direction of Five Forks, where they encountered the Confederate cavalry under Gen. Fitz Hugh Lee. At night Gens. W. H. F. Lee and Rosser joined Fitz Hugh Lee, and Gen. Pickett, with five brigades of infantry, marched down the White Oak road to Five Forks, and assumed command of all the troops operating against Sheridan. Munford's cavalry division engaged Devin in front and Pickett moved with infantry and the other two divisions of cavalry to gain Sheridan's left, crossed Chamberlain's creek, struck Davies' brigade in flank and drove it back on Devin, interposed between Devin and Crook, and with the assistance of Munford drove both Davies and Devin northeastwardly across the country. Fitz Hugh Lee moved up and formed his cavalry on Pickett's flanks. In following Devin and Davies, Pickett had exposed the rear of his column and it was attacked by the brigades of Gibbs and Gregg, which attack forced Pickett to face about. He drove back the two brigades and advanced upon Dinwiddie Court-House. Sheridan had called up Custer with his two brigades, some artillery had come up, and a barricade was thrown up about three fourths of a mile northwest of the court-house, behind which Gibbs and Gregg rallied, and Smith's brigade, slowly driven back by the Confederate cavalry, formed on the left. It was now near sunset, and as Pickett advanced, artillery opened upon him, and when within short range the cavalry from behind the barricades poured such a shower of bullets upon him that he was quickly repulsed, and the battle of Dinwiddie Court-House was over. Sheridan says his loss was about 450. The Union forces engaged at Dinwiddie Court-House and White Oak Road numbered about 42,000; the Confederates about 20,000. The Union loss 29–31 March was 2,198 killed and wounded, and 583 missing. The Confederate loss is unknown. Consult: 'Official Records,' Vol. XLVI.; Humphreys, 'The Virginia Campaign of 1864–5'; Walker, 'History of the Second Army Corps'; Powell, 'History of the Fifth Army Corps'; Grant, 'Personal Memoirs,' Vol. II.; Sheridan, 'Personal Memoirs,' Vol. II.; the Century Company's 'Battles and Leaders of the Civil War,' Vol. IV.

E. A. CARMAN.

Di'ocese, the territory and population over which a bishop exercises jurisdiction. The word diœcesis was originally a term of civil administration, when toward the end of the 3d century the Roman empire was divided into 12 diœceses governed by the emperor's lieutenants, each diœcesis comprising several of the divisions called provinces. When the word came into ecclesiastical use it signified rather one of the grand divisions, patriarchates or primatial jurisdictions, instead of the territory presided over by one of the bishops subject to a patriarch or primate or an archbishop. The word began to be used in the meaning it now has in the latter part of the 13th century; but even later it was used in the sense of our present word parish.

Diocle'tian (Gaius Aurelius Valerius Diocletianus, surnamed **Jovius)**, Roman emperor: b. Diocl'ea, Dalmatia, 245 A.D.; d. near Salona, Dalmatia, 313. He was made emperor by the army 284 A.D., and was generally beloved for the goodness of his disposition. But troubles disturbed the Roman empire, and compelled him to share the burden of government with colleagues; at first with M. Aurelius Valerius Maximianus (286), who defeated the Gauls. Diocletian, at the same time, was successful against the Persians in the East, and afterward penetrated to the sources of the Danube, in Germany. He subsequently, in 292, named C. Gelarius, Cæsar, and Maximianus raised Constantius Chlorus to the same dignity. Thus the empire was divided into four parts. Diocletian resigned the imperial dignity at Nicomedia (305), as did Maximianus at Milan at the same time. Diocletian retired to Salona in Dalmatia, where he found happiness in the cultivation of his garden. In the latter part of his reign he was induced to sanction a persecution of the Christians, whom he had long protected.

Diodati, Giovanni, jō-vän'nē dē-ō-dä'tē, Italian Protestant clergyman: b. Lucca about 1576; d. Geneva 3 Oct. 1649. He was for some time professor, first of Hebrew, then of theology, in Geneva, and in 1619 represented the Genevan clergy at the Synod of Dort, and aided in drawing up the Belgic confession of faith. He is most celebrated for a translation of the Bible into Italian, which is superior to his translation of it into French.

Diodon, dī'ō-dŏn, a genus of teleostean fish, family *Gymnodontes,* order *Plectognathi,* deriving their name from the fact that the ivory-clad terminations of the jaws show no suture, and the fish thus appear to possess but two teeth. The body, as in other members of the family, can be inflated with air till the creature floats on the surface of the water under side uppermost; it is likewise covered with ossifications in the skin, each with a pair of lateral roots and a stiff, movable, erectile spine. The rotundity of these fish when distended has earned for them the name of globe-fish, or prickly globe-fish, in addition to the designations porcupine-fish and sea-hedgehog, suggested by the numerous spines. The four species of *Diodon* are found in all the seas between the tropics, and range to the Cape of Good Hope. The largest species (*D. hystrix*) attains the length of two feet six inches. The food of *Diodon* consists of crustaceans and seaweeds, for the trituration of which its jaws are admirably adapted. This genus has by some naturalists been made the type of a family *Diodontidæ.*

Diod'orus (surnamed SICULUS), Greek historian: b. Agyrium, Sicily; fl. second half of 1st century. In order to render his history as complete and exact as possible, he traveled through a great part of Europe and Asia. It

is very much to be regretted that the greater part of this history, which the author called the 'Historical Library,' in the composition of which he combined the ornaments of rhetoric with the detail of facts, after the example of Theopompus and Ephorus, and on which he had bestowed the labor of 30 years, has not reached our times. It consisted of 40 books, and comprised the history of almost all nations. It is written in the style of annals, and the events are narrated in a confused and discordant manner; but the work is valuable as containing a great mass of materials collected from a number of writers whose works have perished. Only the books 1 to 5 and 11 to 20, and a number of fragments, are now extant.

Diœcious, dī-ē'shŭs, in botany, a term applied to unisexual plants, such as the willow and the hemp, in which the staminiferous and pistilliferous flowers are on separate individuals. In zoology, a term applied to those animals in which the sexes are distinct; that is, those in which the ovum is produced by one individual (female) and the spermatozoid by another (male). It is opposed to monœcious.

Diog'enes of Apollonia, Greek philosopher: b. Apollonia, Crete, fl. in the 5th century B.C. Very little is known of his life. His philosophical speculations were developed in his work 'On Nature,' still extant in the 6th century, but of which we have at present only fragments, preserved in the works of Aristotle, Diogenes Laertius, and Simplicius. His great object was to find the first principle of the world, out of which all things were evolved. Like his master Anaximenes, he came to the conclusion that this great first principle was air.

Diogenes Laer'tius, Greek philosopher: b. Laerte, Cilicia, toward the close of the 2d century A.D. His chief work is 'Lives, Doctrines, and Apothegms of those who have distinguished themselves in Philosophy.' The book is full of absurd and improbable anecdotes, and characterized by much confusion and careless mistakes, yet as containing a mine of information regarding the private life of the Greeks, and many fragments of works now lost, it is of considerable value. It was long the foundation of most modern histories of philosophy, and has preserved the names and doctrines of numerous writers, of whom but for it little would have been known.

Diogenes of Sino'pe, the most famous of the Cynic philosophers, was born about 412 B.C., in Sinope, a city of Pontus in Asia. Having been banished from his native place with his father, who had been accused of coining false money, he went to Athens, and requested Antisthenes to admit him among his disciples. That philosopher in vain attempted to repel the importunate supplicant, even by blows, but finally granted his request. Diogenes devoted himself, with the greatest diligence, to the lessons of his master, whose doctrines he extended still further. At the same time he applied, in its fullest extent, his principle of divesting himself of all superfluities. He taught that a wise man, in order to be happy, must endeavor to preserve himself independent of fortune, of men, and of himself: in order to do this, he must despise riches, power, honor, arts, and sciences, and all the enjoyments of life. He endeavored to exhibit, in his own person, a model of Cynic virtue. For this purpose he subjected himself to the severest trials, and disregarded all the forms of polite society. He often struggled to overcome his appetite, or satisfied it with the coarsest food; practised the most rigid temperance, even at feasts, in the midst of the greatest abundance, and did not even consider it beneath his dignity to ask alms. By day he walked through the streets of Athens baretoot, without any coat, with a long beard, a stick in his hand, and a wallet on his shoulders; by night he slept in a tub, though this last has been doubted. He defied the inclemency of the weather, and bore the scoffs and insults of the people with the greatest equanimity. Seeing a boy draw water with his hand, he threw away his wooden goblet as an unnecessary utensil. He never spared the follies of men, but openly and loudly inveighed against vice and corruption, attacking them with satire and irony. The people, and even the higher classes, heard him with pleasure, and tried their wit upon him. When he made them feel his superiority, they often had recourse to abuse, by which, however, he was little moved. On a voyage to the island of Ægina he fell into the hands of pirates, who sold him as a slave to the Corinthian Xeniades in Crete. The latter emancipated him and entrusted him with the education of his children. In summer he lived at Corinth, and in winter at Athens. It was at the former place that Alexander found him on the roadside basking in the sun, and astonished at the indifference with which the ragged beggar regarded him, entered into conversation with him, and finally gave him permission to ask for a boon. "I ask nothing," answered the philosopher, "but that thou wouldst get out of my sunshine." Surprised at this proof of content, the king is said to have exclaimed: "Were I not Alexander, I would be Diogenes." At another time he was carrying a lantern through the streets of Athens in the daytime: on being asked what he was looking for, he answered, "I am seeking a man." Thinking he had found in the Spartans the greatest capacity for becoming such men as he wished, he said, "Men I have found nowhere; but children, at least, I have seen at Lacedæmon." We are told that Socrates once remarked to him, "I see your vanity through the holes of your coat"; but chronology will not admit of the truth of this anecdote. No doubt many of the anecdotes told of this singular man are fiction. He died 323 B.C., at a great age. When he felt death approaching, he seated himself on the road leading to Olympia, where he died with philosophical calmness, in the presence of a great number of people, who were collected around him.

Diogne'tus, Epistle to, a defense of the beliefs and the religious and social usages of the Christians, written in the 1st century by one who appears to have been himself a disciple of the apostles, but of whose name and history nothing is known. He refutes the false and malicious accusations brought against his brethren — as that in their assemblies they were wont to practise abominable immoralities, that they were atheists, enemies of all government, etc. He writes with the simplicity and candor of one who has nothing to conceal or to explain away; who rather pities the ignorance of the persecutors than reproaches them for their cruelties

and injustices. "The Christians," he writes, "live in their fatherland, but like wayfarers in a strange land; citizens themselves, they share with their stranger brethren; they calmly bear all adversities; they find a fatherland everywhere: but their earthly fatherland is an exile. They marry, like others, but unlike others they do not expose their babes. They live in the flesh, but not according to the lusts of the flesh. They are dwellers on earth, but their true home is heaven. They obey the laws and by their mode of life rise superior to all law. They love all mankind, and all men persecute them. They are delivered up to death and death is for them deliverance."

Di'omede Islands, a group of three small islands in Bering Strait, and midway between Asia and America. They were discovered by Bering in the early part of the 18th century.

Diomedea, dī-ŏm-ę-dē'ą, a genus of birds, including the various species of albatross (q.v.).

Diome'des, king of Argos. He was one of the heroes at the siege of Troy, the son of Tydeus. His daring courage rendered him one of the most distinguished heroes, and, according to the testimony of Nestor, superior to all his contemporaries. Protected by Pallas, he not only encountered the most valiant of the enemies, many of whom he killed, but even ventured to attack the immortals. He was equally distinguished in the council. He boldly opposed the proposal of Agamemnon to leave the plains of Troy without having gained the object of the expedition, and prevailed; he even adhered to his opinion after Achilles had rejected the proffered reconciliation. By carrying off the horses of Rhœsus from the enemies' tents he fulfilled one of the conditions on which alone Troy could be conquered. With Ulysses he removed Philoctetes, who had the arrows of Hercules, from Lemnos, which was another condition of the fall of Troy. Finally, he was one of the heroes who were concealed in the wooden horse by whom the capture of Troy was at length accomplished.

Diomedes, Villa of. See POMPEII.

Di'on Cassius, Greek historian: b. Nicæa, Bithynia, about 155 A.D.; d. there after 230 A.D. He went to Rome about 180; was appointed successively to many high offices; was twice consul; and wrote, in Greek, the 'History of Rome,' from the arrival of Æneas in Italy to 229 A.D. The portions of Dion's work now extant fill five volumes.

Dion Chrys'ostom. See CHRYSOSTOM, DION.

Dion of Syracuse, in Greek history, a connection by marriage of the elder and the younger Dionysius, tyrants of Syracuse, over whom he long exercised great influence. He attempted to reform the younger Dionysius, but his enemies succeeded in effecting his banishment. He afterward returned and made himself ruler of the city, but became unpopular, and in 353 B.C. was assassinated.

Dionæa (dī-ō-nē'ą) **Muscip'ula** ("Venus' fly-trap"), a plant of the sundew family (*Droseraceæ*), found in sandy bogs near the coast of the Carolinas. Audubon reported specimens of enormous size as growing also in Florida. It is a common plant in hothouses. It exhibits in a remarkable degree the irritability common to some plants. There are three hairs upon each division of the leaf, which are so sensitive that an insect alighting upon one of them causes the two sides of the leaf suddenly to come together with considerable force, the strong bristles of the marginal fringe crossing each other like the teeth of a steel-trap, so as to retain the intruder, whose struggles to escape only increase the pressure of the leaf-trap. The insect is retained until its soft parts are digested and absorbed by the plants, after which the leaf opens and the hard parts drop out. This operation requires about 14 days, but if the insect exciting the leaf is not caught, the leaf opens again after an hour or two. The leaf does not retain its vigor for any length of time, gradually becoming inert and drying up. Consult: Darwin, 'Insectivorous Plants.'

Dio'ne, in Greek mythology, the mother of Aphrodite (Venus).

Dionysia, dī-ō-nish'ą, festivals in honor of Dionysus, or Bacchus, which, originating in Egypt, were introduced into Greece by Melampus, 1415 B.C. They were four in number, the Rural or lesser Dionysia, which was the most ancient, the Lenæa, the Anthesteria, and the Dionysia proper, all of which were celebrated annually, with much extravagant merriment, though they were not disgraced by the excesses of the Roman Bacchanalia.

Dionysius, Saint, elected pope in the year 259. He is supposed to have been a native of Greece, but the exact date of his birth is not known. He died 26 Dec. 269, having reigned as pontiff 10 years. Prior to his election as pope he was held in high repute by the theologians of his day, as history states that Dionysius of Alexandria sent him a most important letter on baptism; and later he was the chief theologian in a synod (262) where the principal question had reference to the Trinity. His able commentaries convinced many who had held views different from those taught by the Church.

Dionysius, Saint, "OF ALEXANDRIA": b. Alexandria in the last years of the 2d century; d. there 265 A.D. His family were noble, wealthy, and pagans. Early in his life his philosophical studies turned his attention to Christian writings, and they so influenced his mind, especially the epistles of St. Paul, that he left the pagan schools and became a pupil of Origen. About the year 232 he was ordained a priest, and given charge of the Alexandrian school of theology. In 248 he was consecrated bishop. Shortly after he became bishop of Alexandria the persecution of Decius began, and Dionysius was among the first arrested, and sentenced to be tortured and beheaded. He was rescued by a band of peasants, and for more than a year remained concealed in the Libyan desert. In 257, during the persecution under Valerian, he was again exiled from Alexandria. The writings of Dionysius were numerous, but many have been destroyed. His works were chiefly controversial, or attacks on the heresies of his day. Consult: Butler, 'Lives of Saints'; the English translation, 'Ante-Nicene Fathers.'

Dionysius the Areopagite, converted to Christianity by St. Paul (Acts xvii. 34), during the apostle's visit to Athens. Dionysius is called the Areopagite because he was a member of the high court of Athens, the *Areopagus*, which held its sessions on Mars Hill. It was generally believed by the early historians that this Diony-

sius was ordained a priest, was made bishop of Athens, and ended his life by martyrdom. The New Testament tells us only that he "did believe" and adhered to St. Paul. He has been wrongfully credited with being the author of certain ancient writings on subjects chiefly mystical which, though attributed to that member of the court of Areopagus who was converted to Christianity by the preaching of the Apostle Paul, Acts xvii. 34, must be referred to some unknown writer of the 4th or the 5th century hence the author is now usually styled Pseudo-Dionysius, or Dionysius Pseudo-Areopagite. The titles of the works attributed to the Areopagite, and which seem to have been his writings, are 'The Heavenly Hierarchy'; 'The Ecclesiastical Hierarchy,' 'Divine Names,' 'Mystical Divinity.' Ten letters are attributed to him, purporting to be addressed to St. John the Evangelist, Titus, Polycarp, and others, their contemporaries. These writings came first into notice in 533 at Constantinople when certain Monophysite heretics presented them in confirmation of their doctrines: but they were repudiated by the orthodox as manifestly spurious. Nevertheless before long they came into high favor both in the East and the West and throughout the Middle Ages were received by the most eminent schoolmen as indispensable monuments of the teaching and belief of the early Church. Mgr. Darboy says: "There is scarcely a passage in the writings of Pseudo-Dionysius that has not been quoted by Thomas Aquinas."

Dionysius the Elder, Syracusan tyrant: d. 367 B.C. He contrived to make himself master of the citadel of Syracuse, together with all the arms and provisions contained in it, and finally to declare himself tyrant, at the age of 25 years. After having finished a short war against the Carthaginians he made preparations for a great war against Carthage. He attacked the Carthaginians at once by land and water, and gained a complete victory, which was soon followed by an advantageous peace. In 368 he commenced a new war against the Carthaginians, intending to drive them entirely out of Sicily. He did not, however, succeed in this attempt, and was obliged to conclude a disadvantageous peace. He holds the unenviable place in ancient history as the representative tyrant. He lived in continual dread of assassination, of which the sword of Damocles has become the symbol. He had the state prison so constructed that even the solitary murmurings of its inmates could be heard by him, and it was hence called the Ear of Dionysius.

Dionysius the Younger, Syracusan tyrant. He succeeded his father, Dionysius the Elder. Dion his kinsman directed his attention to the doctrines of Plato, representing to him that this great philosopher alone was able to teach him the art of government, and the means of rendering his subjects happy. In consequence of this advice Dionysius invited Plato to his court. The latter succeeded in tempting him into the path of virtue and knowledge, and in giving a new character to his whole court. An opposite party, however, awakened the king's suspicions against Dion, and caused his banishment. Dion subsequently made himself master of Syracuse, to which Dionysius did not return until after the murder of Dion. The rule of Dionysius now became so oppressive that Timoleon appeared with a fleet before Syracuse, and expelled the tyrant. Dionysius was carried to Corinth, where he is said to have gained a scanty living by giving lessons in grammar.

Dionysius, Ear of. See EAR OF DIONYSIUS.

Dionysius Exig'uus, an eminent scholar of the 6th century. He it was who introduced the now existing method of calculating the Christian era. He was a monk and, according to his close friend Cassiodorus, was of Scythian origin (*natione Scytha*). His surname Exiguus (little) was perhaps self-assumed by him out of humility, for lowly mindedness is one of the virtues enumerated by Cassiodorus in his eulogy of his friend; but the surname may have had reference to his stature. His reputation was high as a theologian and as one intimately conversant with the Scriptures and with the ordinances of the Church. He is author of a collection of ecclesiastical constitutions and canons which is still extant. Many writings of ancient Greek authors have been saved for us in the translations made of them into Latin by Dionysius.

Dionysius of Halicarnassus, Greek critic, historian, and rhetorician: b. about 50 B.C.; d. 7 B.C. He came to Rome about 29 B.C., and lived there on terms of intimacy with many distinguished contemporaries till his death. His most valuable work is his Greek 'Archæologia,' a history of Rome down to 264 B.C. Of the original 20 books, we possess only the first nine in a complete form. He was a greater rhetorician and critic than historian, and his extant works on oratory, on the criticism in detail of the great Greek orators, on the characteristics of poets and historians from the time of Homer to Euripides, and upon Thucydides and Dinarchus, possess great interest and value.

Dionysus, dī-ō-nī'sŭs, the original Greek name of the god of wine, the name Bacchus, by which he was also called by both the Greeks and the Romans, being at first a mere epithet or surname. See BACCHUS.

Diophan'tine Analysis, that branch of algebra which treats of the method of solving certain kinds of indeterminate problems relating principally to square and cube numbers, and rational right-angled triangles. The following are examples: (1) To separate a given square number into two parts, each of which shall be a square number; (2) to find three square numbers which are in arithmetical progression; (3) to find a right-angled triangle whose sides shall be commensurable with each other.

Diophan'tus of Alexandria, Greek mathematician. He flourished, according to some authorities, about the middle of the 4th century, according to others about the end of the 6th. He left 13 books of 'Arithmetical Questions,' of which only six are extant; and a work on 'Polygon Numbers.' See DIOPHANTINE ANALYSIS.

Diopside, dī-ŏp'sid, a variety of the mineral pyroxene occurring in monoclinic prisms. It is a silicate of calcium and magnesium, having the formula, $Ca\,Mg\,(SiO_3)_2$. Iron is occasionally present in considerable amount, replacing the magnesium, and it then graduates towards hedenbergite. It has a hardness of

about 6, and a specific gravity of about 3.3. It is usually pale green to nearly colorless and when transparent yields gems of considerable beauty. The finest gems come from Dekalb, New York, where it occurs in transparent crystals varying from colorless to a deep, rich green. Ala, Piedmont, is another celebrated locality.

Dioptase, dī-ŏp'tās, a rare, beautiful and highly prized mineral, occurring in prismatic crystals of rich emerald-green color and vitreous lustre. Its inferior hardness, 5, greater specific gravity, about 3.3, the terminal rhombohedrons on its crystals, and its reactions for copper, easily distinguish this so-called "emerald-copper" from the true emerald. It is found sparingly near Clifton and near Riverside in Arizona, also in the French Congo, Chile and Hungary, but the finest specimens are from Russia.

Diop'trics (from Gr. *dia,* through, *op,* see), the science which treats of the refraction of the rays of light, when the rays pass through different refracting mediums — for instance, from the air, through the lenses of a telescope. Dioptrics, consequently, is a branch of optics. It demonstrates the different directions in which the rays move, according as they are broken on plane or curved surfaces. The principles deduced from these observations determine the nature of the various lenses, explain the manner in which the light is refracted in the human eye, teach the manner of making telescopes, microscopes, etc. The ancients were not acquainted with this science. Natural science in modern times has been greatly indebted to it. By its aid the human eye has been enabled to reach objects previously unknown. Kepler, Snellius of Leyden, Descartes, Newton, etc., not only extended this science, but founded a great part of their discoveries on it. In modern times, science has been enriched by the invention of the achromatic telescope. See LENS; OPTICS; REFRACTION; TELESCOPE.

Diora'ma, a method of reproducing landscape scenery, invented or perfected by M. Daguerre, and first exhibited by him in 1823. The particular advantage which this method possesses is, that it causes the light to play over the picture with an intensity graduated at will. The illusion is heightened by the transparencies, through which light is poured from behind the picture. The principle of the diorama has been successfully applied in producing some of the prettiest scenic effects of the modern stage.

Diorite, dī'ō-rīt, a rock consisting essentially of hornblende, biotite mica, and plagioclase felspar that have a granitoid, or completely crystalline, texture. According to variations in composition, there are augite-diorites which grade into gabbros and quartz-diorites which grade into granites. The hornblende and augite-diorites are dark-colored; the quartz-diorites, light-colored. As augite changes readily to hornblende, many so-called diorites may represent altered diabases and gabbros; by further metamorphism the hornblende changes to chlorite. Diorites under shearing stresses may be changed into hornblende and chlorite schists. Andesites and dacites are rocks of the diorite family, but having a porphyritic texture. As compared with the syenites, diorites contain less potash and soda but more lime and magnesia, hence the principal felspar is soda-lime. True diorites are rare in the United States, though quartz-mica diorites and augite-diorites are not uncommon, and grano-diorites — the intermediate stages between diorite and granite — occur in great masses in the Sierra Nevada, in California. True diorites occur in various places abroad. One from Wales contains: SiO_2 61.75; Al_2O_3 18.88; Fe_2O_3 0.52; FeO 3.52; Cal. 3.54; MgO 1.90; Na_2O 3.67; K_2O 1.24; and has a specific gravity of 2.79.

Dioscoreaceæ, dī-ŏs-kō-rē-ā'sę-ē, a natural order of monocotyledenous plants, with alternate reticulate-veined leaves, tuberous rootstocks, and twining stems. The flowers are small and unisexual. There are nine genera, with about 175 species, chiefly inhabiting tropical America and South Africa. The typical genus is *Dioscorea,* which includes the yam of commerce (*D. sativa*). The best-known species in eastern America is the wild yam-root (*D. villosol*), which is found in moist thickets from Rhode Island north, south to Florida, and west to Texas. It ascends to 4,000 feet in the Virginia Mountains. The flowers are of a greenish-yellow bloom in June and July, and the fruit, which adheres to the vine until late in the winter, is ripe in September. *Tamus* (*Testudinaria*) *elephantines,* a South African species, sometimes called elephant's foot, and Hottentot's bread, has a large fleshy rhizome, with a rough cracked bark, which is used as food by the Hottentots in times of scarcity.

Dioscorides, dī-ŏs-kŏr'ī-dēz, Peda'nius, physician: b. Anazarbus (Cæsarea Augusta), in Cilicia, in the 1st century A.D. He was author of a celebrated work on materia medica, in five books. It is particularly valuable in regard to botany, as most of the medicines which the author mentions are taken from the vegetable kingdom. Two other works are also attributed to him — the 'Alexipharmaca,' which was united with the 'Materia Medica,' forming the three last books of it, and treating of the poisons in the three kingdoms of nature, and their antidotes; and the 'Euporista,' which treats of remedies that are easily procured. The best edition of Dioscorides is that of Sprengel (1829-30).

Dioscuri, di-ŏs-kū'rī, the classical name for Castor and Pollux, twin brothers, and tutelary deities of wrestlers, horsemen, and navigators. Their transplantation to the sky as one of the 12 constellations of the zodiac (the Twins) is a celebrated allegory of mythology. They are sometimes styled Tyndaridæ, because Tyndarus was the nominal father of both.

Dioscu'rus, or Dioscorus, patriarch of Alexandria, immediate successor (444) of St. Cyril, was a supporter of the heresiarch Eutyches (q.v.). Pope Leo and Flavianus, patriarch of Constantinople, having condemned the teachings of Eutyches, Dioscurus procured from the Emperor Theodosius II. the convocation of a council of bishops at Ephesus in 449. To this council Pope Leo sent three legates as his representatives. Dioscurus was present, surrounded by a host of his satellites, and with their aid prevented the legates from presiding in the council and even from reading to the bishops the letters addressed to the assembly by Leo. Flavianus was so roughly handled by the rabble that he died shortly after in consequence of the injuries he received. The council thereafter got the title of Latrocinium (Brigandage) from the

Latins, and of Συνοδος Ληστρικη from the Greeks (robbers' synod), but Theodosius upheld its decisions, and Dioscurus procured the appointment of one of his partisans, Anatolius, to succeed Flavianus in the see of Constantinople. After the death of Theodosius another council assembled at Chalcedon in 451, which annulled the decrees of the Latrocinium of Ephesus and decreed the deposition of Eutyches from his offices as presbyter and archimandrite.

Diosma, a genus of plants belonging to the rue family (*Rutaceæ*). They are small shrubs with white or red flowers; leaves alternate or opposite, simple. They are remarkable for their overpowering and penetrating odor, arising from the presence of a yellowish volatile oil. They are the buchu plants of the Cape of Good Hope. The plant has been employed in chronic affections of the bladder and urinary organs in general, and has also been administered in cholera.

Dios'pyros, a genus of plants belonging to the ebony family (*Ebenaceæ*). There are about 100 species, most abundant in Asia. They consist of trees and shrubs with white or pale yellow flowers. *D. lotos* is the Indian date-plum, and is supposed by some to be the lotus of the ancients. The trees of several of the species furnish ebony wood. The fruit of *D. kaki* is occasionally brought from China as a dry sweetmeat. *D. virginiana*, the American representative of the family, is the persimmon (q.v.).

Dip, in geology, the angle of inclination of any stratified rock to the horizontal of its bedding planes. In the same way the cleavage planes of any metamorphic rock are said to dip and a thin intrusion of igneous rock, a dike, has a dip. Also the contact plane of an igneous and a sedimentary rock may have a well-defined dip. The direction of the dip is the line of highest inclination and is expressed by compass bearing; thus a bed may dip 63° N., 35° E. The angle of dip is determined by an instrument known as a clinometer. Initial dip is the name given to the slight inclination away from the land that sedimentary beds have as a whole when laid down in the sea. Such initial dips are often of importance in determining flexures when the sediments are subsequently subjected to mountain-building pressures. See Fault; Fold; Geology; Mountain.

Diphthe'ria (Gr. *diphthera*, a skin, piece of leather, extended in meaning to comprise membrane), a contagious and (in its severe forms) malignant disease, caused by a specific bacillus, and generally characterized by the formation of a fibrinous false membrane in the throat. Although previously observed, it was first clearly described in 1826 by M. Bretonneau of Tours under the name of "diphtherite," as a form of very fatal sore throat occurring chiefly in children. It is now known that most cases of membranous croup are identical with diphtheria. The membranous inflammations of the throat occurring sometimes in scarlet fever and other infections fevers may or may not be true diphtheria, a bacteriological examination being usually necessary to determine this point.

The period of incubation is usually from two to seven days. The disease begins by malaise, feeling of chilliness, loss of appetite, headache and more or less fever; soon the throat feels hot and painful and the neck is stiff and tender. If seen early, the throat is red and swollen, but a false membrane of yellowish or grayish color quickly appears in spreading patches, usually first on the tonsils, whence it often spreads to the pillars of the fauces, uvula and back of the throat, and may even extend down the œsophagus or gullet; extension of the membrane into the nasal cavities is a grave symptom. There is usually enlargement of the glands at the angle of the jaw, and albuminuria generally occurs at some stage of the disease. Diphtheritic membrane may be formed on any mucous surface, or even on a wound; if it extends into the larynx it gives rise to cough and difficulty in breathing. The throat affection is often accompanied by a low and very dangerous form of fever, with quick, feeble pulse and great and rapid loss of the patient's strength, which is still further reduced by the inability to take food; in other cases, the disease is fatal by paralysis of the heart or by suffocation, due to invasion of the larynx. Invasion of the larynx may necessitate intubation or tracheotomy. After the acute disease is over, the recovery may be delayed by paralytic symptoms of various kinds; or simply by extreme debility with exhaustion and loss of appetite. In the early stages of convalescence there is danger of sudden heart failure upon exertion.

Diphtheria is contagious. It may occur as a complication of scarlet fever, measles, and other infectious diseases. All gradations in the intensity of the disease from mild sore throat to septic and gangrenous forms occur. Damp and temperate climates seem to favor its development. Insanitary conditions favor its occurrence, but the disease may appear under the most favorable hygienic surroundings. An important mode of its spread is by school children, either infected in a mild form or coming from households where the disease exists. One attack affords little or no protection against recurrence. In the treatment of the disease the patient should be isolated and all clothing and other articles which have been in contact with the sick, as well as the discharges, should be disinfected. Local applications to the diseased parts and means to maintain the strength of the patient were the most valuable therapeutic measures before the introduction of the antitoxin treatment.

True diphtheria is now known to be caused by a specific bacillus called *Bacillus diphtheriæ*, or the Klebs-Löffler bacillus. This bacillus was first recognized by Klebs in 1883 by microscopical examination of diphtheritic membranes, but it was first successfully cultivated by Löffler in 1884. Its causal relation to the disease was not thoroughly established till the investigations of Roux and Yersin in 1888, who demonstrated the existence of a peculiar and intensely poisonous substance known as the diphtheria toxin. It is now generally admitted that the Klebs-Löffler bacillus is the cause of true diphtheria. The diphtheria bacillus is a slender rod characterized especially by irregularities in shape and staining with aniline dyes. It grows best at about the temperature of the human body, and all growth ceases below 20° C. It can be cultivated artificially on various media, but best on a mixture of blood serum and beef-broth rendered solid by heating. In a moist condition the bacilli are killed in a few minutes by a temperature of 60° C. They survive for months in a dried condi-

tion. Exposure to the direct rays of the sun kills the bacilli in a short time. Guinea-pigs, when inoculated beneath the skin with a small quantity of a pure culture of the virulent diphtheria bacillus, die within two to five days with characteristic changes in the body. Skilled bacteriologists can recognize the presence of diphtheria bacilli in the throat by microscopical examination and the appearances in the cultures within 24 hours or less, but their complete identification may require the inoculation of a guinea-pig. Both in human beings and in animals the bacilli grow only or mainly locally in the false membrane, the severe constitutional symptoms being due to the absorption of a powerful poison secreted by the bacilli.

The ways in which diphtheria bacilli may be conveyed from sick to healthy persons are almost countless. In ordinary breathing the expired breath contains no germs, but in speaking and especially in coughing, a fine spray is emitted which may contain the bacilli and thus convey the disease. All sorts of articles, such as handkerchiefs, toys, drinking utensils, furniture, clothing, bed-linen, and the like, may become contaminated with the bacilli and be the means of spreading the disease. The specific germs have been found in the hair, on the shoes, and elsewhere on the persons of those brought into frequent and close proximity to the patient. Direct contact with the patient, as in kissing, may communicate the disease. It is especially through direct or mediate contact with infected individuals that the disease is spread. Hence, preventive measures, consisting in isolation of the patient till the bacilli have disappeared from the throat, and in thorough disinfection, are of the first importance in checking the spread of diphtheria. Insanitary conditions, formerly thought to be the direct cause of diphtheria, are now regarded only as accessory causes in affording opportunities for the prolonged survival of the specific germs or in weakening the powers of resistance of the individual.

The discovery of the diphtheria bacillus has led to the introduction of a new and most successful method of treatment of the disease, known as serum-therapy or the antitoxin treatment. The establishment of the principles and the introduction of this treatment are due especially to Behring of Germany and Roux in Paris. The underlying principle of the treatment is based on the fact that, if a susceptible animal is inoculated first with small and then with increasing doses of the toxin produced by the bacillus, the blood of the animal is found to contain a substance called antitoxin, which has the power of neutralizing or rendering harmless the toxin. In order to obtain large quantities of the healing serum a horse is generally selected for the process of immunization. By proper methods very powerful antitoxins can be obtained. The antitoxin is used not only to cure the disease, but also to render persons insusceptible for a time to the disease. This latter procedure of preventive inoculation has been found especially useful in preventing extensive outbreaks in children's hospitals and asylums after the introduction of one or more cases of diphtheria. Dr. William H. Welch, of the Johns Hopkins University, in 1895, in an analysis of over 7,000 cases of diphtheria treated by antitoxin found that the fatality was reduced by this treatment by over 50 per cent of the previous death-rates; he concluded that the antitoxin serum is a specific curative agent for diphtheria, surpassing in its efficacy all other known methods of treatment for this disease. Since his report, this conclusion has been confirmed and even more favorable results have been obtained.

Some idea of the great benefits which have been derived from the discoveries outlined above may be had by comparing the death rate before and after the serum therapy became the practice. For the five years immediately preceding the discovery and use of antitoxin in the city of Berlin the death rate for diphtheria in every 10,000 inhabitants was 10.2 per cent, and for the next five years it fell to 3.7 per cent; in Paris, 6.5 per cent before antitoxin, and 1.3 per cent afterward; in New York 14.5 per cent before, and 6.3 per cent after antitoxin. So safe is the use of antitoxin, it is now advised that every child exposed should receive an immunizing dose, as that confers protection.

William H. Welch, M.D.,
Professor of Pathology, Johns Hopkins University.

Diph'thong, two vowel sounds, following one another so closely as to form but one syllable, as in out, where the sound is really composed of a and u. Many double vowels in English are not real diphthongs, there being only one sound heard, whereas some single vowels have a diphthongal sound. The only real English diphthongs are i as in high; i as in aye; oi in boil; ow in how; and ew in mew.

Diple'gia. See Paralysis.

Diploblas'tica. See Embryology.

Diplococ'cus. See Bacteria.

Diplodocus, dĭ-plŏd'ō-kŭs, a saurian-footed, herbivorous dinosaur found in the American Jurassic deposits. The length of skull of this species was about 21 inches, of brain about 3 inches, and of body 50 feet. The animal is supposed to have been a hippopotamus-like wader, and to have lived on vegetation in the water.

Diplo'ma (Gr. *diploō,* "fold" or "double"), originally a document on two tablets of wax (see Diptych), or on writing material which was folded. The Roman emperors granted diplomas to couriers, giving them the use of public servants and horses; hence diploma came to signify a writing or document conferring some power, authority, privilege, or honor, usually under seal and signed by a duly authorized official. Diplomas are given to graduates of a university on their taking their degrees; to clergymen who are licensed to officiate; to physicians, civil engineers, etc., authorizing them to practice their professions.

Diplo'macy, simplified, means political negotiation. Commonly applied the term refers to international relations and the adjustment of differences between nations. The principle objects of diplomacy have always been and are to-day to preserve the independence, rights and security of state and nation. Under diplomacy has been preserved the European "balance of power," the prevention of general wars and the securing of commercial advantages under treaty regulations. As a matter of fact all treaties are the result of diplomacy. In the past there have been many international and other conventions or congresses of diplomats, to preserve the peace

of the world and to settle differences of international moment. Such was the congress of Westphalia held in 1648, to settle the issues involved in the Thirty Years' War; the Congress of Vienna (1814-15); and the more recent Hague conference (1899) held at the instance of the Czar of Russia, for the promotion of the peaceful settlement of international differences among civilized nations. In the various countries, under modern methods and conditions, the usual instruments of diplomacy are: (1) the secretaries of state for foreign affairs; (2) regular diplomatic agents or representatives of various grade ranging from ambassadors to *chargés d'affaires* or consular agents; (3) special embassies and diplomatic agents or representatives appointed for the accomplishment of a particular purpose, as the case of the Alaskan Boundary Commission at London (1903). Prior to the 15th century diplomats were of the last named class. See AMERICAN DIPLOMACY; INTERNATIONAL LAW; UNITED STATES — DIPLOMACY OF THE.

Diplomat'ics, Diplomatic, the science of deciphering ancient MSS., inscriptions, etc. See PALÆOGRAPHY.

Diplopia, dĭ-plō'pĭ-ạ, an affection of the sight in which objects are seen double. It arises from derangement of the visual axis.

Diplop'terus, a genus of fossil ganoid fishes, of four species, belonging to the Old Red Sandstone.

Diploz'oon, a parasitic trematode worm which infests the gills of the bream, and which appears to be formed of two distinct bodies united in the middle, and resembling an × or St. Andrew's cross, two sexually mature individuals being thus united. The larva, formerly called *Diporpa*, swims about in the water for a time, but ultimately settles in the gills of a fish, where it remains during the rest of its existence. The larvæ then unite in pairs by the attachment of the ventral sucker of one individual to a knob on the back of another.

Dip'noi, one of the primary subdivisions of fishes, characterized by the presence of membrane or covering bones on the skull, the absence of secondary bony jaws (maxillary, premaxillary, and dentary bones), and the direct articulation of the lower jaw with the skull. The *Dipnoi* were early predominant in geological times, many and varied forms occurring as fossils in the Middle and Upper Palæozoic strata. Some of these, forming the order *Arthrodira*, are of doubtful relationship, and are classed with the *Dipnoi* only provisionally. The best-known representatives of this group have the anterior region of the body enclosed in continuous bony plates, with a complex articulation between the head and trunk. In the Devonian of Ohio are found giant forms, like *Dinichthys* and *Macropetalichthys*, from 10 to 25 feet long, and with sharp-beaked jaws like a turtle's. Numerous other *Dipnoi*, more closely resembling the still living ones, have been found as fossils in various parts of the world. At the present time the group is decadent, and but three genera and as many species, each found in a restricted area in widely separated regions of the earth, remain. They are, *Protopterus* from Africa, *Lepidosiren* from South America, and *Ceratodus* from Australia. On account of the lung-like structure of the swim-bladder and its function as an organ of respiration, they are known as lung-fishes. Being the earliest vertebrates which are believed to have breathed air, the *Dipnoi* have an exceptional interest, and many zoologists consider them to have been the original stock from which the *Amphibia* and all other terrestrial vertebrates arose. Consult: Dean, 'Fishes, Living and Fossil.'

Dippel, Johann Conrad, yō'hän kōn'räd dĭp'pĕl, German mystic and alchemist: b. Frankenstein, near Darmstadt, 10 Aug. 1673; d. Berleburg, Prussia, 25 April 1734. He led a wandering life for many years, involved in difficulties political and theological, and he finally wrote a tract which appears to have ruined him with all parties, and to have provoked replies in the same spirit as that in which the attack had been made. He now fell in with some alchemical books, and at once threw himself into the search for the philosopher's stone. In this also he was assisted by others, who hoped to profit by the discovery, but when no result was obtained, and the money was not forthcoming, Dippel retired to Berlin, where he induced some persons of rank and wealth to help in the search. During his residence here he produced what is known as Dippel's Oil (q.v.), from which followed indirectly that of Prussian blue — an accidental discovery, it is true, but one of a class that could hardly have been made but for the constant and multifarious, though not well-directed labors, of such men as Dippel.

Dip'pel's Oil, the black fetid oil which was formerly produced by the distillation of stag's horn or ivory, and was used medicinally. Dippel, in the 17th century, refined it by washing with lime or potash, and rectifying the oil until it became limpid and aromatic. This rectified oil was the *oleum animale Dippelii* of the older pharmacopœias, which was prescribed in doses of a few drops as an antispasmodic and diaphoretic, and as a hypnotic.

Dipper, a name given to the seven stars in the constellation of the Great Bear, from their being arranged in the form of a dipper, or ladle.

Dipper, a water-ousel. See OUZEL.

Dipping-needle, or **Inclination Compass,** an instrument for measuring the magnetic dip or inclination; that is, the angle which a magnetized needle, free to move in the plane of the magnetic meridian, and about a horizontal axis, makes with the horizontal plane at the place. The dipping-needle is a light magnetized steel bar supported on a horizontal axis which passes, as nearly as possible, through the centre of inertia of the bar. The axis is either a steel knife-edge which rests on agate plates, or a fine wire supported by friction-rollers. A vertical circle surrounds the needle, the axis on which the needle turns being at the centre; the circle is graduated, and the needle moving over the graduations, the inclination to the horizon can be read off by means of it. The vertical circle is mounted on a vertical pillar, which turns round its own axis; and to the pillar there is attached at the foot an arm or pointer, which moves over a horizontal graduated circle. This last is supported on three legs furnished with leveling screws.

To observe with the dipping-needle the vertical circle must be placed in the plane of the magnetic meridian, and then the angle at which the needle is inclined must be read off by means of the graduations on the circle. The plane of the magnetic meridian might, of course, be determined by means of a separate instrument, such as the declination compass (q.v.). But this is not necessary, the vertical pillar and horizontal circle described above furnishing all that is required. A complete observation is made in the following way. The instrument having been properly leveled, the vertical circle is turned round on the pillar till the needle points vertically downward. When this is the case we know that the needle must be moving in the vertical plane at right angles to the plane of the magnetic meridian, because it is only in this plane that there is no horizontal component of force acting on the needle. The vertical circle is now turned round on the pillar through 90 degrees, which is done exactly by means of the horizontal circle at the foot. The needle is thus free to move in the plane of the magnetic meridian, and the inclination is read off.

Corrections for defects in the instrument must be applied in order to make the determination exact. In the first place, in order to correct for any error in centering of the axis on which the needle turns, readings are taken at both ends of the needle. Next, because the magnetic axis of the needle may not coincide with the axis of the figure, the needle is turned over on its bearings, and fresh readings are taken. Thirdly, the axis on which the needle turns may not pass exactly through the centre of inertia of the needle. If this were the case the needle would not balance about the axis exactly, one or other end of it being the heavier. To do away with error from this source, after one set of readings have been taken, the needle is lifted from its bearings and remagnetized, the end that was formerly north being now made the south end. A complete new set of readings is taken. The mean of all these gives the true inclination. See DECLINATION NEEDLE; MAGNETISM, TERRESTRIAL.

Diprotodon, dī-prō'tō-dŏn, a huge extinct marsupial of the Pleistocene Period in Australia. Its nearest living relatives are the wombats and kangaroos, which it somewhat resembled in the character of the head. The animal was by far the largest of the marsupials, almost equaling a small elephant in size, and resembling the elephants in its rather long legs and short post-like feet. The structure of the foot-bones is very remarkable; the great toe is short and stout, the others reduced to small slender rudiments. Its remains have been found in great abundance in certain dried-up salt lakes (Lake Callibona, etc.) of the central Australian deserts.

Dip'sacus, the typical genus of the *Dipsaceæ*. See TEASEL.

Dip'sas, a genus of tropical opisthoglyph serpents, mostly tree-snakes with greatly elongated bodies and protective coloration, which are usually nocturnal, and feed mainly upon lizards and birds and their eggs, though some species pursue mammals and other birds exclusively. Their posterior poison-fangs (see OPISTHOGLYPHA) are large, but they differ in venomous ability, which is rarely deadly to a large animal. This and several allied genera form the colubrid sub-family Dipsadinæ.

Dipsoma'nia. See ALCOHOLISM.

Dipsosaurus, dĭp-sō-sâ'rŭs, a reptilian genus of the family *Iguanidæ* (plurodont lizards), whose habitat is confined to the warmer parts of the United States. The genus contains but one species, *D. dorsalis,* which is terrestrial in its habits. When alarmed, it raises its head and tail and glides swiftly to its burrow in the sand.

Dip'tera, an order of two-winged insects, of which the common housefly and bluebottle are familiar examples. They are characterized by a body with slight coriaceous coverings, a trunk open beneath, and containing a sucker composed of two, four, or six lancet-shaped elongated scales, two palpi, antennæ almost always composed of three joints, large eyes, an abdomen of four to seven distinct segments, tarsi with five joints, and two short clubbed appendages called *halteres* or balancers, which seem to be the rudiments of the posterior pair in four-winged insects, and are kept in continual motion. They all undergo a complete metamorphosis. They are found in the earth, the air, and the water, in all climates and in all localities. The far greater number live exclusively on the sap of flowers.

Diptera'ceæ, or **Dipterocarpeæ,** an important order of exogenous trees. They are found in India, and especially in the eastern islands of the Indian archipelago. There are about 8 genera and 48 species known. The trees belonging to this order are handsome and ornamental, and abound in resinous juice. When young, the *Dryobalanops camphora* yields, on incision, a pale yellow liquid, consisting of resin, and a volatile oil having a camphoraceous odor; when old, it furnishes a kind of crystalline camphor. Other species produce fragrant resins used in temples, also varnishes; while some of the commonest produce pitches, and valuable timber.

Dip'terus, a fossil fish occurring in the Devonian rocks, and belonging to the Dipnoi sub-class, family *Dipteridæ,* of which this is the typical genus. Its distinguishing character is the possession of double dorsal and caudal fins. An interesting fact connected with it is that it approaches nearer to the lung-fishes than do any of the present existing ganoids.

Diptych, dĭp'tĭk, a tablet consisting of two leaves, light boards, held together by a hinge. In the time of the Roman empire diptychs were much used in correspondence between friends; even when three boards or more were used the name diptych (*Sintoxos,* folded double) was generally retained instead of triptych, tesseraptych, etc. Diptychs figure largely in the history of the Church for several centuries, being tokens of intercommunion between the assemblies of the faithful throughout the world. The use of diptychs in the liturgical service was in full vogue in the middle of the 4th century and it must have commenced much earlier. It was continued in the Latin Church to the 12th century and in the Greek Church to the 15th. The Diptychs of the Living had inscribed on them the names of the pope, patriarchs, bishops then living and presiding over the faithful in their respective spheres; also the names of the clergy of the particular churches in which they were

kept; names also of benefactors of the churches, of the emperor, and the empress, etc. For all these the faithful offered their prayers. The Diptychs of the Dead contained usually the names which had once been written in the Diptychs of the Living. In the diptychs were also inscribed the names of the Virgin Mary, martyrs, and other saints. If any name, whether of the living or the dead, was erased from the diptychs it signified that the person was regarded as out of the communion of the Church. The diptychs both of the living and dead were read from the *ambo* or pulpit to the congregation. Church calendars and martyrologies seem to have had their origin in the diptychs. In the Roman Missal, the marks of the diptychs are very evident. At the prayer, "Te igitur," the names of the reigning pope and the bishop of the diocese are mentioned. In other prayers of the Mass the diptychs are followed. Consult: Kraus, 'Real — Encyclopadie'; Benedict XIV., 'De Missa.'

Dipus. See JERBOA.

Dique, dēk, Canal del, Colombia, an "artificial arm" of the Magdalena River in the department of Bolivar. It is navigable by steamers, and is a means of communication between Cartagena and the interior of the republic. Its total length is about 74½ miles, and in its course it passes through several swamps and receives the waters of various conduits, reaching the coast south of Cartagena.

Diræ, dī'rē, or Eumenides. See FURIES.

Dirce, dėr'sē, in Greek legend, the second wife of Lycus, king of Thebes, who from jealousy imprisoned Antiope, whom Lycus had divorced in order to marry herself; but Jupiter set Antiope at liberty, when she soon gave birth to two sons, Amphion and Zethus. These latter having grown up, put Lycus to death, and attached Dirce to the tail of a wild bull, which dragged her over the rocks, on which she was dashed to pieces. The gods, pitying her misfortunes, changed her into a spring, which bears her name and flows near Thebes.

Dircks, Henry, English civil engineer: b. Liverpool 26 Aug. 1800; d. Brighton 17 Sept. 1873. He published: 'History of the Search for Self Motive Power' (1861); 'The Ghost as Produced in the Spectre Drama' (1863); etc.

Direct and Retrograde, terms which, when used in astronomy, have reference to the real or apparent motion of the planets. When the planet moves forward or appears so to move, from west to east, in accordance with the order of signs in the zodiac, the motion is said to be direct. When the motion appears contrary it is said to be retrograde.

Direct Legislation. See REFERENDUM.

Direct Taxes, those which in theory the bearer cannot transfer to others, by adding correspondent charges to goods or service; as distinguished from indirect, those on goods for sale, which will be added to their selling price. The former in current understanding include taxes on polls, property, incomes, and privileges — that is, fees and licenses for doing business, keeping pets, carriages, etc. But the Supreme Court of the United States, in the income-tax cases, decided that only taxes on polls and property are direct; which is law for this country. The theory at best does not quite conform to facts. Taxes on real estate occupied by the owner, for example, are not transferable; but those on property for rent are so much added rent charge, and as indirect as customs duties. The heavy license fees charged by many municipalities for doing certain classes of business are *pro tanto* an increase of the business expense, and must be met in the charges if the business is to live; often, indeed, they are used openly as "protective," to give industries of one State an advantage over others — this is especially so with insurance companies. On the other hand, income taxes on salaries cannot in practice be transferred, as an employer will not raise salaries on account of his employees' taxes; while those on mercantile incomes are in the same category as those on licenses, and can to some extent be recouped from customers. All State and municipal revenues in the United States are raised from direct taxes in the broader sense; the Constitution prohibits them from laying duties on exports or imports, but not on internal manufactures, which, however, are also left entirely to the general government. The latter restricts itself to customs and excises. Only five times in its history has it resorted to direct taxation, in the narrower sense above: in 1798, 1813, 1815, and 1816, on real estate and slaves; and in August 1861 a levy of $20,000,000 for war expenses was laid on all house lots with dwellings and improvements. The operation of the act was suspended 1 July 1862, when $15,000,000 had been collected; and the act of 2 March 1891 refunded it to the States.

Directors, the persons authorized to manage and direct the affairs and business of a corporation or company. The directors are sometimes called managers or trustees, in accordance with the purpose and nature for which the corporation or company was formed. At the present time, nearly if not all, corporations are formed under general laws and it depends on the law under which the corporation is created as to the number of directors and their qualifications. The general qualification is that all directors must be stockholders in the corporation or, if it has no stock, they must be members of the corporation. The directors are generally elected by the stockholders, and some States have passed laws allowing cumulative voting, by which each stockholder may multiply the number of his shares by the number of directors to be elected, and cast all his votes for one director or distribute them in any manner he desires. It has been held that this kind of a law is unconstitutional, if applied to corporations created before the law was passed; as it impairs the obligation of the contract. It may be valid, if applied only to corporations created after the passage of the act. In some cases directors are appointed. The directors must act as a body and not as individuals. A majority of the board of directors is necessary to a legal meeting and if that number is present a majority of those present will be sufficient to perform any act. When there is a quorum present, all acts performed are presumed to be done in the regular course of business. The directors for the purpose of the business of the corporation are held to be the corporation itself; and their powers and duties depend on the laws under which the corporation is formed and the charter and by-laws

of the corporation. Notice to the board of directors during a meeting of any matter in which they are required to act is notice to the corporation.

The directors are considered as general agents of the corporation, and they are the only ones that can manage the business of the corporation; although the directors are generally elected by the stockholders they are responsible to the corporation and through the corporation to the stockholders. As the directors derive their power from the charter their acts are of no effect if they are outside of the delegated power; and all acts performed by the directors which are outside of their power must be passed upon by the stockholders.

While directors are sometimes called trustees, they are not held to the same strict accountability as an ordinary and regular trustee; although their position is a fiduciary one. The directors may deal with the corporation the same as any other individual; but they cannot use their position for any special benefit to themselves. They may even go so far as to buy up the indebtedness of the corporation and at a sale buy in and acquire the absolute title to the corporate property. The directors may delegate their power to an agent, as a private individual may do, and the agent's power is not impliedly revoked by a change of the members of the board, as the act of appointment is not that of the directors individually but of the board. The directors have a discretionary power and when it is honestly exercised there is no one that can make them account for their acts. A frequent illustration of this power is in relation to suit by or against the corporation, as to whether they shall be brought or defended. If a director's individual interests are in conflict with the interests of the corporation the act must be fair and just to the corporation.

Directory, a compilation of the names and addresses of the persons in a city, or in a special line of trade, or the like. The first directory of the city of London was issued in 1677, under the title 'A Collection of the Names of Merchants,' and the first New York directory in 1786, the latter containing less than 1,000 names. The London directory of 1732 is believed to be the first which bore the title "directory." Every American city of moderate size now has its directory, and many directories of towns and counties are issued. There are also a few State directories, and a great number of business directories, arranged according to the needs of the respective localities. Directories of firms in each of the leading lines of trade are issued regularly, often in connection with some sort of commercial rating. Directories of people in society are commonly termed blue books. Telephone companies also issue directories of their subscribers.

City directories constitute the most important class of these publications, and are commonly issued by private enterprise. The concern that issues the first directory of a town or city, and continues to issue the same at regular intervals, usually yearly, soon establishes a sort of franchise, which enables them to control that field as long as they issue a satisfactory book. There are a number of firms in the United States whose sole business is publishing directories, and they have acquired territory by being the first in their respective fields. As a rule they do not compete with each other in the same territory, for even in very large cities a second directory rarely pays.

The gathering of names and addresses for a directory, when rightly done, is an expensive matter, involving a house-to-house canvass of the entire territory, within a short space of time. Sometimes the work is cheapened by the copying of assessors' lists or lists of voters, but the great majority of directory publishers find that the best way is to make their own canvasses yearly. To protect themselves against the competition of firms that might simply copy the book and thus compete with them at a much reduced cost, all experienced directory publishers now insert a number of bogus names and addresses in their books, which are copyrighted. While a competitor would have a right to issue another correct, and therefore very similar, book without infringing the copyright, the fact that he copies these bogus names is direct evidence of infringement, calculated to result in a judgment of damages to the injured party.

The mere placing of names in alphabetical order for a directory seems a simple matter, yet in reality it involves considerable care and judgment. Take the names "McNeil" and "MacNeil" for instance. If they are separated, a person searching in the directory under one spelling might miss the other altogether. As it is generally understood that "Mc" is simply an abbreviation of "Mac," the directories now commonly begin the lists of M's with the "Mcs," which ever way they are spelled, allowing such names as "Madison" and "Magee" to appear farther on. The location of such names as begin with figures also calls for discretion, as when it is desired to insert "1st Ward Republican Club." Such an entry is usually put in the f's, even if "1st" is the authorized way of spelling it.

The profit in directories is mainly in the advertising, and few of them would be issued simply for the sake of the sale. The number of firms that buy them is naturally limited to successful business concerns whose business requires frequent reference to a directory. Drug stores habitually carry copies on their counters for the benefit of the public, and many banks and newspaper offices have copies in their offices placed conveniently for the use of customers.

The advertising in the directory of a large city commands a high price, and yields large returns. It is customary to place the advertising on the margins of the leaves of the directory, and almost all over the cover, as well as the edges of the book. No available spot is considered sacred from such intrusion, as is the case with most newspapers and magazines. Any man or firm that will pay for it can have his or their name inserted in as big type as desired, or secure conspicuousness in any other way that ingenuity can suggest.

At the present time the directory field of industry in the United States appears to be rather crowded, and many directories are published not for immediate profit, but simply to hold a field until it shall grow large enough to be profitable. A few years since an association of directory publishers was formed, which holds annual meetings, and endeavors to check unwise competition, and to conserve the interests of the trade as a whole.

Directory, in French history, the executive body established by the constitution of the French republic in 1795. (Fr. *directoire*.) This body consisted of five members, called directors (*directeurs*) who were chosen by the Council of Elders from candidates presented by the Council of Five Hundred. Each director was president for three months in rotation, and one was compelled to make room for a new member every year. The unpopularity of the directory's home policy was increased in 1799 by the disastrous results of its war policy, and it was easily overthrown by the *coup d'état* of Napoleon and his brother Lucien, 9 Nov. 1799. See FRANCE.

Direc'trix (Lat. *linea directrix*, "a directing line"), in mathematics, a line governing the direction of another line. If a point so move that its distance from a given fixed point is to its perpendicular distance from a fixed straight line in a constant ratio, it describes a conic section, of which the fixed straight line is termed the directrix, and the fixed point the focus. The constant ratio referred to is termed the eccentricity, and its magnitude determines the nature of the conic. Thus, if in the figure AB be the directrix and F the focus, if the point P move so that its distance from F is to its distance PM from AB in a constant ratio, then P will trace out a conic section, which will be an ellipse, parabola, or hyperbola, according as the ratio in question is less than, equal to, or greater than unity — that is, as FP is less than, equal to, or greater than PM, or FV than VI. A quadric surface has a directrix with analogous relations. The fixed lines on which rests the line whose motion, right or curved, generates a surface, are called directrices, or directing lines.

Dirhem, dēr'am, or **Dramm**, a modification of the Greek *drachma*, the name under the caliphs for a weight of silver equivalent to about 45 grains, and was also used for precious stones and medicine in Arabia, Persia, Egypt, and Turkey. As a coin the value varied, but may be given at 11 cents under the caliphs. In Turkey, the name dirhem has lately been given to the much smaller weight, the French gramme.

Dirk, a kind of dagger formerly carried sheathed between skin and stocking as a weapon by the Highlanders of Scotland. Dirks are worn by midshipmen and cadets of the British navy. See DAGGER.

Dirk-Hartog (dērk-här'tŏg) **Island**, an island on the west coast of western Australia, at one of the entrances to Shark Bay, which it partly encloses; area, about 450 square miles. It forms a plateau with good pastures and plenty of water. The pearl oyster and edible oysters are here in great abundance.

Dirschau, dēr'show, Prussia, city, about 19 miles southeast of Danzig, on the Vistula. The city has railroad and machine shops, and large sugar works. Pop. 12,000.

Dirt-eating. See GEOPHAGY.

Dis (also **Orcus** and **Tartarus**), in Roman mythology the name given to Pluto, the Greek god of the lower regions. The word *dis* is akin to *dīvus*, and originally denoted merely godhead.

Disability, in law, when absolute disables the party from holding public office or doing any legal act, and is usually the result of murder, outlawry, or any outrage upon person or property. Aliens, infirm and aged persons, dependent on public charity, are under this ban of incapacity, and in most Catholic countries those individuals who have been excommunicated. There is a disability termed partial that covers infancy, minority, lunacy, and drunkenness. Also a term in accident insurance policies which, on account of inability to work or perform natural duties resultant from injuries, provides payment for the afflicted party. See ATTAINDER.

Disassociation. See DISSOCIATION.

Disbar'ment, the expulsion of an attorney, counselor, or advocate from practice at the bar, this act depriving him of the privileges of his profession. A lawyer suffers this penalty if adjudged guilty of any misconduct of grave nature, as gross contempt of court, bribery, etc. The courts alone have this power of dealing with a man. Before disbarring him the accused is given every opportunity to refute the charge, being allowed to defend himself in open court. A lawyer so dealt with may, at the discretion of the authorities, be restored when sufficient proof is brought them that there is no likelihood of a future offense.

Discharge, in architecture, the relieving part of a wall, or a beam or other piece of timber, from the superincumbent weight by means of an arch thrown over it. In hydraulics, the issuing direction of water from a reaction or turbine wheel; as the outward discharge, or Fourneyron turbine; the vertical discharge, or Jonval turbine; the centre discharge, etc. In bankruptcy, a writing or document certifying that a bankrupt has satisfactorily passed the necessary forms, and is thereby discharged from all further responsibility for the debts contracted by him previous to his bankruptcy. In the military and naval services, a document given to each soldier or sailor on his dismissal from or quitting the service, in which are detailed full particulars as to his length of service, conduct, reason for discharge, etc. In electricity it signifies the removal of the charge by communication between the positive and negative surfaces or poles, or with the earth.

In dyeing, a substance such as chloride of lime or nitric acid, used by calico-printers to remove a color. Suppose a white pattern is to be produced on a uniformly colored ground. The cloth is first dyed, and then the pattern is printed with an acid, such as the tartaric, thickened with gum. When passed through a dilute solution of bleaching-powder, the acid decomposes it, and the liberated chlorine destroys the color at the parts where the pattern was printed. Sometimes the cloth is prepared at the same time for subsequent pigment printing.

Disciple, literally, one who learns anything from another; and hence, the followers of any teacher, philosopher, or head of a sect. In this sense the word is sometimes used in Scripture, as when we read of the disciples of Moses, of John, of Christ. Generally, however, it is used with reference to the last of these — the followers of Jesus. Sometimes all who re-

ceived the doctrines of Christ are called disciples, but in a more limited sense, it is applied to the 70, or 72, persons who were his more immediate followers and attendants. Sometimes it is used as synonymous with apostle, and is applied to the Twelve.

Disciples of Christ. The religious movement, whose representatives have come to be known as Disciples of Christ, or Christians, may be said to date its origin from the 'Declaration and Address' issued by Thomas Campbell, September 1809, and endorsed by his son, Alexander Campbell, who later became the leader of the movement. Thomas Campbell migrated from the northern part of Ireland in 1807, to seek a home for himself and his family in the New World. He located near Washington in western Pennsylvania. He was related by blood to the poet, Thomas Campbell, and was a man of learning and profound piety. Being a minister in the Seceders' branch of the Presbyterian Church, he entered upon his labors in connection with that denomination immediately upon his arrival in this country. His experiences in seeking to assemble the scattered people of God of different names and creeds, and to instruct them in spiritual things, led him to realize more fully the evils of divisions among Christians. In his efforts to promote greater unity and cooperation among the members of these different sects, he found himself in conflict with the ecclesiastical authority under which he was working and was brought to trial before his presbytery, which censured him for his course. Mr. Campbell soon withdrew from the ecclesiastical authority under which he had been preaching, but continued his ministry to an increasing number of people in private dwellings and wherever else an audience could be gathered.

In the 'Declaration and Address' referred to it was declared that "the Church of Christ upon earth is essentially, intentionally, and constitutionally one, consisting of all those in every place that profess their faith in Christ and obedience to Him in all things according to the Scriptures, and that manifest the same by their temper and conduct; and of none else, as none else can be truly and properly called Christians." While admitting the necessity of "distinct societies, locally separate one from another," this new declaration of independence declared that "there ought to be no schisms, no uncharitable divisions among them. They ought to receive each other as Jesus Christ also received them, to the glory of God, and for this purpose they ought all to walk by the same rule; to mind and speak the same things, and to be perfectly joined together in the same mind and in the same judgment." The address adds that "in order to do this, nothing ought to be inculcated upon Christians as articles of faith, nor required of them as terms of communion, but what is expressly taught and enjoined upon them in the Word of God. Nor ought anything to be admitted as of divine obligation in their church constitution and management but what is expressly enjoined by the authority of our Lord Jesus Christ and his apostles upon the New Testament Church, either in express terms or by an approved precedent."

In a word, the new movement had for its aim no less an object than the unity of Christians as they were one in the apostolic Church. In order to realize this consummation in harmony with the Lord's intercessory prayer they decided to reject all party names for those given in the New Testament, and all human creeds or formulas as authoritative or binding on the human conscience, or as bases of fellowship, and to take the word of God alone as their rule of faith and practice, and especially the New Testament, which was given for the guidance and instruction of Christians in their new life in Christ. Believing it to be necessary to return to the original foundation and practice of the Church in order to realize its unity and its power, they made a fresh study of the New Testament to ascertain (1) what was the essential creed or confession of faith required in the early Church; (2) on what conditions persons were received into its membership; and (3) what was the nature of their organization and government. They reached the conclusion that the confession of faith made by Simon Peter, on which Jesus declared he would build his Church, namely "Thou art the Christ the Son of the living God," was the creed of Christianity and the essential faith, and that all those who would make this confession from the heart, being penitent of their past sins, were to be admitted by baptism into the membership of the Church; that baptism in the early Church consisted of the burial of a penitent believer in water in the name of the Father, and of the Son, and of the Holy Spirit, and that only such were fit subjects for baptism; that the form of Church government was congregational; that each congregation had its deacons and elders or bishops, the former to look after the temporal, and the latter the spiritual interests of the Church. The Lord's Supper, it was found, was observed at first daily perhaps, but later weekly, on the first day of the week, in remembrance of Christ's suffering and death. Hence they practice weekly communion.

With this plea for the New Testament basis of fellowship, and a return to the original purity and simplicity of the gospel and Church organization, the Disciples have made a marvelously rapid increase. The movement at present has reached a numerical strength of 1,250,000, having its colleges, its religious journals, and its missionary, educational, and benevolent organizations, all of which are doing effective work. The American Christian Missionary Society is the national organization for home missions. The Foreign Christian Missionary Society, as its name indicates, has for its object the evangelization of the world. Besides this the Christian Woman's Board of Missions is an organization of the Christian women, which is doing mission work in both the home and foreign fields.

The Disciples of Christ raised over $600,000 for missionary purposes in 1902, while contributing a grand total of over $6,000,000 for all religious purposes in that year. They are supporting missions in India, China, Japan, Africa, the Philippines, Cuba, Porto Rico, Mexico, Scandinavia, and Turkey. Their aim is to be evangelical without being sectarian, and to be liberal without being latitudinarian. They attribute their success to their advocacy of Christian union, the simplicity and directness of their preaching and the freedom which they enjoy, untrammeled by human creeds or by any hierarchical authority.

The following statistics are taken from the annual official report for 1902:

	1902	
Number Churches	10,957	
Number Communicants	1,207,377	
Number Sunday Schools (Sunday Schools)	8,271	
Number Officers and Teachers	796,699	
Number Ministers	6,477	
MISSIONARY.		
American Christian Missionary Society	$178,324	
Christian Woman's Board of Missions	139,034	
American Christian Missionary Society	82,931	
Board of Church Extension	54,866	
State and District Missions	154,059	
Miscellaneous Missions	15,000	$ 624,214
EDUCATION AND BENEVOLENCE.		
Buildings and Endowments of Schools	$175,000	
Homes for Orphans, the Aged, etc.	72,332	
Ministerial Relief	7,421	$ 254,753
LOCAL CHURCH WORK.		
Ministerial Support	$3,065,000	
Incidental Church Expenses	760,000	
Church Buildings	550,000	
Church and Bible School Literature	340,000	$5,315,000
Total from all sources		$6,193,967

Editor The Christian-Evangelist.

Disciples of Christ. See Christ, Disciples of.

Discipli'na Arca'ni, the modern name of an ancient usage of the Christian Church in withholding from pagans, and even from catechumens during their preparation for admission to baptism, the knowledge of certain of the Church's doctrines. The existence of this rule of silence in the Church in the 4th century is shown by the Catecheses of St. Cyril (q.v.) of Jerusalem, where the lectures on the sacrament of the Eucharist are deferred till after the catechumen had been baptized. He was then made acquainted with the *catechesis mystagogica,* or mystic catechism. Sometimes in that age when the sacred mysteries had to be referred to in a mixed assembly of believers and pagans, or in writings addressed to pagans, the fathers would use forms of speech quite unintelligible to the uninitiated, adding, "the believers will understand." On one occasion St. Epiphanius alluded to the sacramental words of institution of the Eucharist, "This is my body" in this cryptic fashion, saying instead of τοῦτό ἐστιν τὸ σῶμά μου, τοῦτό μού ἐστι τόδε. And St. John Chrysostom writing to Pope Innocentius about the profanation of the Sacrament on a certain occasion, writes plainly: "The most holy blood of Christ was spilled upon the clothes of those soldiers." But Palladius, in his life of Chrysostom, uses a cryptic form of language to denote the same occurrence; his words are: "They spilled the *symbola.*" St. Paul is quoted as enjoining a like reticence where he writes to the Corinthians that he fed them with milk, not with strong meat, because they were not able to bear it. Testimonies of the ancient fathers concerning the existence in their times of the *disciplina arcani* are numerous and, says Newman, "that it existed even as a rule with respect to the Sacraments, seems to be confessed on all hands."

Discipline, in military and naval affairs, the general term applied to the prescription and enforcement of statutes, rules of procedure, orders, and regulations governing officers and men in service. Regimental discipline is chiefly maintained by the adjutant. He inspects and tells off all guards, escorts, and parties; keeps the regimental books; receives all garrison orders; superintends the drill and field movements, etc. In matters of discipline the adjutant-general is to the whole army what the adjutant is to a regiment.

Discipline, Books of, two books connected with the Scottish Church. The First Book of Discipline was drawn up by John Knox and four other ministers, and laid before the General Assembly in 1560. It was also submitted to the privy council; and though not formally ratified by them, it was subscribed by the greater part of the members. A similar document, called the 'Second Book of Discipline,' was prepared and sanctioned by the General Assembly of 1578; and from that time it has been recognized as the authorized standard of the Church of Scotland in respect of government and discipline. It lays down principles regarding the relations of Church and state; defines the provinces, duties, and relations of church-officers, the mode of their election, etc., and states the operation of the Presbyterian polity in the General Assembly, synods, and presbyteries of the Church of Scotland.

Discipline, Ecclesiastical, the control and correction which ecclesiastical bodies claim the right to exercise and administer for the purpose of maintaining correctness of living, and soundness of belief among their members. The only form of discipline at present exercised over contumacious lay members of a religious body consists of excommunication, or exclusion from a share in the ministrations and offices of the Church. The clergy, on the other hand, are liable to suspension or deposition; the former a temporary, the latter a perpetual, deprivation of office and authority. For methods by which the civil power was authorized by the Church during the Middle Ages to discipline heretics or notorious evil doers, see Inquisition.

Disclaimer, in equity, a plea put in on the part of a defendant in which he disclaimed all right or title to the matter in demand by the plaintiff's bill. In patent law, disclaimer is the renunciation or relinquishment of all claim to patent rights in an invention. The term is also applied to the refusal to accept a gift or devise of land or other property, and generally to the waiving of any claim.

Dis'co, an island on the west coast of Greenland, under the parallel of 70° N. It is mountainous, reaching a height of 3,000 feet; about 90 miles in length; and contains much excellent coal. The harbor of Godhavn is on the south coast.

Discob'oli, Cuvier's name for the lumpsuckers (*Cyclopterus*), beside which he placed the *Remora* (q.v.). The term is still used for the family to which the lumpsucker (q.v.) belongs.

Discob'olus, (1) in classical antiquity, a thrower of a discus, or quoit; a quoit-player; specifically, the name given to the famous Greek statue of the quoit-thrower, preserved among the Townley Marbles in the British Museum. (See Discus). (2) In ichthyology a name given by Cuvier to his third family of soft-finned teleostean fishes, having the ventral fins under the

pectoral. The name is derived from the ventral fins forming a disk on the under surface of the body, by which the fishes are enabled to catch hold on the points of rocks.

Dis"comedu'sæ. See JELLYFISH.

Discoph'ora. See LEECH.

Discord (Latin *discors*, inharmonious), in music, is a combination of sounds producing irregular vibrations and technically called cacophony. It is a direct violation of harmonic laws and frequently spoken of as nothing but downright noise. Often confused with dissonance (q.v.) which, however disagreeable the effect it has upon a hearer, obeys certain grammatical rules in the science of music, though never consonant. Celebrated composers have used discords purposely in their compositions requiring *macabre* character. Berlioz in his 'Damnation of Faust' is a case in point, while Wagner's scores bristle with cacophonies and dissonances.

Discount (O. F. *discontes*, to count off), a deduction made from a quoted price, in consideration of a cash payment. Discount is also the amount deducted from the face value of a bill of exchange or promissory note, as the price for cashing it to the payee so many months or weeks before it is payable by the person who is primarily responsible for its payment. Bank discount is simple interest on the face value of a promissory note, and deducted from the face value, instead of being reckoned on the amount advanced. True discount is such an amount deducted, as would be simple interest on the amount advanced, for the time specified in the note.

Discoveries of America to 1542, Spanish and Portuguese: John Fiske writes: "Properly regarded, the discovery of America was not a single event, but a very gradual process. It was not like a case of special creation, for it was a case of evolution, and the voyage of 1492 was simply the most decisive and epoch-marking incident in that evolution."

Half of a century was occupied in the principal Spanish and Portuguese discoveries which, being followed by colonization, gave to those nations their vast possessions in the western hemisphere. In 1492 Columbus landed on Watling Island, which the natives called Guanahani, and which he named San Salvador, 12 October (see BAHAMAS); discovered Cuba 28 October; Hispaniola, now called Haiti or Santo Domingo, 6 December; thought Haiti must be Japan, and Cuba the Asiatic mainland; deserted by Martin Pinzon with the Pinta, and his flagship the Santa Maria having been wrecked, he returned to Spain in the Niña, arriving at Palos 15 March 1493. In 1493, seven weeks after the return of Columbus, Pope Alexander VI. assigned undiscovered lands, etc., west of a certain line to Spain, and east of the same line to Portugal (see DEMARCATION, LINE OF); on 25 September Columbus sailed from Cadiz, his second voyage bringing him in sight of the island of Dominica, 3 November; Guadaloupe and Marie Galente were discovered 4 November; Antigua 10 November; Porto Rico later in November, and the town of Isabela was founded on the northern shore of Hispaniola in December. The ruins of Isabela, the first town established by Europeans in America, are to be seen about 25 miles west of Puerto Plata. In 1494 Columbus discovered Jamaica, 3 May; the Isle of Pines 13 June. In 1497 Vicente Yañez Pinzon, Solis, Amerigo Vespucci, and others sailed from Cadiz, 10 May; probably their first landfall was the coast of Honduras, whence they followed the coast of Mexico and the United States, rounding Florida, and proceeding up the Atlantic coast to "the finest harbor in the world," conjectured to be the Chesapeake Bay; returning to Spain by way of the Bermudas, and reaching home 15 Oct. 1498. In 1498 the third expedition of Columbus started on 30 May from the Spanish port of San Lucas de Barrameda; discovered Trinidad 31 July; Columbus caught a glimpse of the land at the delta of the Orinoco, and called it Isla Santa, or Holy Island, 1 August, but after passing the mouth of the Orinoco reasoned that so vast a stream of running water could be produced only upon a continent; went westward to Cubagua. In 1499 Vespucci, with Ojeda and La Cosa, followed the northern coast of South America for a long distance, seeing a part of the coast of Brazil, the Guianas, and Venezuela, and proceeding west of Cubagua as far as the Gulf of Maracaibo and Cape de la Vela. In 1500 Vicente Yañez Pinzon (who had sailed for Spain in December 1499) struck the Brazilian coast near the site of Pernambuco, 20 January, and discovered the Amazon 26 January; Diego de Lepe, between January and June, followed the Brazilian coast to latitude 10° S. approximately: Cabral landed on the Brazilian coast, which he explored from about 12° to 16° 30′ S., taking possession in the name of the king of Portugal (see BRAZIL); Bastidas, La Cosa, Balboa, and others (see CENTRAL AMERICA), sailing in October, explored westward from Cape de la Vela to the Gulf of Urabá, and beyond that to Puerto Bello on the Isthmus, the voyage ending September 1502; Gaspar and Miguel Cortereal made voyages to Labrador in the interests of Portugal (1500–1–2), but the coasts visited were mainly within the region previously explored by the Cabots. In 1501 Vespucci sailed for the Brazilian coast, 14 May, his voyage ending 7 Sept. 1502; he explored the Atlantic coast of South America from 5° S. to 34° S., and sailed thence to South Georgia Island, 54° S. In 1502 Columbus set out on his fourth voyage, 11 May; discovered Martinique 13 June; during the latter part of that year and the earlier part of 1503 he carefully studied the coast between the gulfs of Honduras and Darien, especially that of the narrowest part of the Isthmus (see CENTRAL AMERICA). In 1503 and 1504 Coelho and Vespucci sailed along the coast of Brazil, the former to about 40° S., the latter to about 23° S.; Jaques explored the Brazilian and Patagonian coasts to about 52° S. In 1505 and 1507 Vespucci, La Cosa, and others explored the Atrato River and the Darien region. In 1508 Cuba was circumnavigated by Ocampo, and thus first known to be an island; during a voyage extending from 29 June 1508 to October 1509, Solis and Pinzon explored the Brazilian coast to about 40° S. In 1512 and the following years explorations of the interior of Colombia, etc. (see DABAIBA), were undertaken in the hope of finding an Eldorado. In 1513 Balboa (q.v.) discovered the Pacific; Ponce de Leon in March discovered some of the Bahamas, and on Easter Sunday, 8 April, landed on the coast of

Florida. In 1516 Solis, searching for a strait at La Plata River, was killed by the natives. In 1517 Cordova explored the coasts of Yucatan. In 1518 Grijalva explored the Mexican coast, etc. In 1519 Cortes discovered and began conquest of the Mexican uplands of the interior. In 1520 Magellan discovered the straits which bear his name, 21 October; entered the southern Pacific Ocean 28 November. In 1524 the first (unsuccessful) expedition sailed from Panama bound for Peru. In 1527 Narvaez led an expedition to the upper Gulf of California. In 1531–33 a part of the empire of the Incas (see CUZCO, PERU) was explored and conquered by Francisco Pizarro and others. In 1535 Grijalva discovered California; Diego de Almagro led a force into Chile, but was compelled to withdraw. In 1540 Pedro de Valdivia set out from Peru to succeed where Almagro had failed. In 1541 Francisco de Orellana descended the Amazon from Peru. In 1542 Gonzalo Pizarro returned to Quito from the exploration of the heart of the South American continent; and about the same time De Soto died in the Mississippi valley, having discovered the great river of the North American continent.

MARRION WILCOX,
Authority on Latin-America.

Discovery, in law, the act of a litigant who is called on to reveal or make known any matter or document which will aid in enforcing a right or repelling an unjust demand.

Discovery, The, a ship noted in the history of exploration, as the vessel built by the East India Company in 1602 to determine the whereabouts of the northwest passage. She was originally commanded by Capt. George Weymouth, who sailed with a consort from Greenland, 2 May 1602. In 1610 Henry Hudson discovered the Hudson Bay in the same vessel, spending the succeeding winter in the ice. In 1611 the crew mutinied and set Hudson and some of his companions adrift, never again to be heard of. Later she was commanded by Sir Thomas Button (q.v.) who discovered Nelson's River and other points. In 1615 and 1616, the Discovery sailed with Baffin (q.v.) and Bylot, making important discoveries and explorations. In 1875–6 the name was borne by a steam vessel, one of the two in Nares' expedition.

Discovery of America. See AMERICA; NORSEMEN.

Discus, among the Greeks and Romans a quoit of stone or metal, from 10 to 12 inches in diameter, convex on both its sides, sometimes perforated in the middle. The players aimed at no mark, but simply tried to throw the quoit to the greatest possible distance. It was sometimes furnished with a thong of leather to assist in the throwing. The throwing of the discus was a notable feature of the revival of the Olympian Games at Athens in 1896. In these games the discus-throwing event was won by Robert Garrett of Princeton University, who far outclassed all the foreign competitors. The world's record in 1900 was 118 feet 9 inches, held by C. Henneman, an American. See DISCOBOLUS; QUOITS.

Disease, a term which refers to any morbid deviation from normal health — as disease of mind or body — and refers specifically to a group of morbid conditions which may affect the same part of the body and exhibit similar symptoms, such as disease of the lungs, disease of the brain, Bright's disease, that disease of the arteries which causes a hardening of the muscular elastic coat, and which is called arteriosclerosis, disease of the mind (Jastrow). Such a definition posits the knowledge of what is normal, and this is often a very difficult position to understand. Thoma has suggested as an empirical definition of disease a deviation from the normal in its anatomical or chemical structure, or in the functions of the body, its organs and elements of organs, which exceeds the limits of individual physiological variation. This definition, the author himself admits, gives no explanation of the nature of the processes. It does no more than to give the criteria for deciding when any condition is to be called pathological. That is, it may readily be seen that any definition of disease from a general standpoint must necessarily take into consideration what normal physiological variations may be, and it is now acknowledged that no hard and fast lines can be drawn between normal and pathological processes. Barker has well said: "The activities of cells are subject to certain definite laws, which hold in diseased conditions of the body as well as in health. When the structure or function of the organism differs markedly from a normal standard for the species, the reason lies either in abnormality in the inherent activities in some or all of the cells of the body or in the abnormal nature of the environmental influences to which some or all of the cells are exposed, or in both. In any of these cases, morbid instead of normal reactions are encountered. In the first instance, environmental influences, normal for healthy individuals, would call forth morbid reactions; in the second instance, individuals previously healthy would become diseased through environmental influences which are incompatible with the maintenance of health because outside the ordinary deviations from the average; and in the third instance the two conditions would be combined. Properly speaking the science that studies diseased or abnormal conditions is called pathology, but because of the extension of the science it is divided into several departments. Thus one distinguishes general pathology from descriptive pathology. General pathology stands with reference to special pathology in the relationship that philosophy occupies with reference to the individual sciences. It is the synthesis of the forms which special pathology affords. It endeavors to find out the laws that govern disease in general, searches for the causes of disease, discovers the order of events in diseased conditions, and groups the symptoms and lesions common to whole series of special pathological processes. Commonly it is popular to speak of diseases as organic and functional; organic diseases having attached to them definite structural changes in the organs affected; functional diseases being understood as diseases in which no such structural changes are demonstrable. This is a purely artificial distinction, however, and on close analysis cannot be maintained. Diseases are classified in general for purposes of general inquiry, particularly as to the statistical studies for economic purposes such as are involved in tabulation of cases of death, by health boards, for hospital returns, and for medical departments in the army and navy. These classifications are of great importance for the gathering

of much useful information, but they are naturally subject to much change, as new discoveries ally certain heretofore apparently unrelated diseases under common heads. Consult Hektoen, 'American Text-book of Pathology.'

Diseases, Germ Theory of. As a speculation, the germ theory of disease is centuries old; as demonstrable in fact, however, it is a thing of but yesterday. Aristotle in the second century believed that certain diseases were due to microscopical organisms, although he and many others who believed the same could not prove it, but it was reserved for Pasteur, Koch, and other modern students of the young science of bacteriology to demonstrate beyond doubt that certain disease processes result from the invasion of the human body, as well as those of animals and plants, by certain forms of lowly organized plant and animal life, and that the disturbance in the healthy functions of these animals and plants is an indication of the battle taking place between the living animal or plant cells and their animal or plant parasites.

In the early days of the germ theory of disease, it was thought that only plants such as molds and bacteria could give rise to disease, but it has been further demonstrated within recent years that there are a large number of lowly organized animals which might obtain an entrance into the body and there cause disease. Historically it is of interest to note that one of the first diseases definitely proven to be associated with bacteria was a certain disease of silkworms. This was studied by Pasteur, and opened the way to subsequent discoveries of modern bacteriologists, so that at the present time it is clearly proved that such affections as diphtheria, tuberculosis, typhoid fever, pneumonia, cholera, tetanus, anthrax, relapsing fever, influenza, erysipelas, rheumatism, the plague, glanders, and actinomycosis, are due to definite bacteria, while malaria, certain forms of dysentery, certain forms of abscess of the liver, and some skin diseases are known to be caused by low forms of animal life, the protozoa; and still higher in the animal kingdom it is known that certain parasitic worms give rise to definite forms of disease, some of these being known as distomiasis, ascariasis, trichinariasis, uncinariasis, filariasis. In addition to these the ordinary tapeworms may be mentioned. With reference to the bacterial agents that cause disease, in the article on bacteria (q.v.) it was pointed out that there were a great many forms of these plants and that only a few of these were known as pathogenic, or as disease-producing. This term pathogenic, however, is purely a relative one, because under certain circumstances the introduction of well-known pathogenic micro-organisms in the human body may be harmless. In the study of the pathogenic effects of any given bacterium both the micro-organism and the animal host should be taken into consideration, because any resulting disease is a product of some detail of the characters of the infecting agent on the one hand and of the subject of the infection on the other. There may be many modifying circumstances, involving each of these factors. Thus as regards the character of the particular species of bacterium that may enter the body, its effect will depend chiefly upon its inherent virulence, the number that may be introduced into the body at one time, and the path through which the infection takes place. Thus the virulence (meaning largely the power of multiplying) of many micro-organisms in the body varies greatly under different conditions. With reference to the number: The healthy tissues can resist the certain number of pathogenic micro-organisms of given virulence, but if a larger number are introduced it may be that the animal will succumb. This is a fact demonstrated to be true for tuberculosis in high degree. The path of infection is of much importance, for if virulent micro-organisms are thrown directly into the blood-stream, and can thus traverse the entire body looking for a favorable nidus or growth, the chances are much against the organism. With reference to the subject of infection: The species of the animal, his race peculiarities, and his age are all important items. Thus it is known that tuberculosis among the Indians is extremely fatal; whooping-cough, when first introduced into New Zealand, was almost universally fatal; children are susceptible to infectious diseases which the adult escapes; local diminished vitality plays a very important role in the production of disease in many individuals. See IMMUNITY.

As to the modes of bacterial action, two main factors are known to be involved; one concerns the ability of the bacteria to multiply in the animal body after they have once entered, and the other, the production of poisons by them that may act upon the tissues. The former process is known as the infection, the latter as the intoxication. Thus in the discussion of the germ theory of disease, it is understood here that the disease process as seen in the individual is nothing more or less than an evidence of the struggle that takes place between the protective agencies of the body on the one hand and similar self-assertive processes taking place in the bacterial body, for it can hardly be denied that rapid multiplication and the production of poisons are the means employed by bacteria for self-protection. This production of poisons is one of the most interesting features of the study of bacterial diseases, and it is probably true that these poisons, or toxins as they are termed, result both from the breaking down of the nutrient materials on which the bacteria feed, and as a result of their intravital activities. It is probably true that the action of bacteria as disease-producers depends largely upon the chemical products formed directly or indirectly by them, and that this action is shown by certain tissue changes that are produced in the body, local or systemic, and by symptoms of intoxication of varying character. The tissue changes that may be produced by bacteria are so various as to include almost every type of known pathological change. In general, however, they are those of a degenerative or necrotic nature, indicating direct damage, or they are those of a reactive defensive nature on the part of the body of the infected animal, the former indicating the degree of vulnerability, the latter the protective power that the tissues possess. Many of the symptoms occurring in bacterial affections result from the changes just outlined, and it is of importance to note as a special proof of the truth of the position that bacteria may cause disease that nearly all, if not quite all, of the changes found in the organs

of a diseased body, and also the symptoms observed in infective disease, can be experimentally reproduced by the injection of bacterial poisons. Of the precise chemical nature of these poisons very little is known, therefore the general term toxins has been applied to them. It is known, however, that both the living and the dead bacteria contain these intracellular toxins, and therefore dead bacteria under certain circumstances can bring about destructive changes in the human body. It would seem from the recent work of Brieger, Martin, Fraenkel, and others that these bacterial toxins belong to the general group of albumoses, and that their action is analogous in many ways to a number of enzymes. Many of them are allied to well-known animal and vegetable poisons, such as ricin, abrin, and a number of the snake-poisons, particularly those of the rattlesnake and the heloderms. For theories of toxic action, and details regarding protective agencies of the human or other animal body in its struggle with disease-producing micro-organisms, see IMMUNITY. See also ANTITOXINS; DISEASE.

Diseases of Plants. Diseases in plants have existed as long as plants themselves — ages before the advent of man. Civilization and agriculture have usually developed together in all parts of the earth and it is not strange that anything that troubled or destroyed an important food plant should be observed and the cause sought. In the earliest historic records as well as in early Greek and Roman times some of the more destructive diseases of plants, like rust and mildew or blight of cereals were widely known and discussed. A special deity was recognized who ruled these phenomena and to whom sacrifices were offered.

Injury due to animals, especially insects, and to extremes of weather and unfavorable soil conditions were early often associated with their appropriate causes. It was not, however, until the latter part of the 18th and the beginning of the 19th century that the solid foundations of plant pathology were laid by the development of anatomy and physiology. The early works of Unger, 'Die Exantheme der Pflanzen,' etc., (1833); Weigmann, 'Die Krankheiten und Krankhaften Misbildungen der Gewächse' (1830); and of Meyen, 'Pflanzenpathologie' (1841), mark an important step forward in the embryo science of plant pathology. During this period microscopical, chemical, and physiological work with plants was active. The writers of this period rather overworked unfavorable nutrition as the cause of disease. Maladies that could not be traced to visible external causes were usually held to be due to unsuitable nourishment or the lack of something in the soil. It was not believed that the fungi so often found associated with diseases had any causal relation to them. They were held to be abnormal developments of the diseased cells themselves and not independent organisms. It remained for De Bary to determine the true nature and habits of fungi and bacteria and to demonstrate their causal relation to disease in many cases. His careful work gave a great stimulus to investigation in plant and animal pathology and opened what has proved to be the most important field of the science. His two most important works are 'Untersuchungen uber die Brandpilze,' etc. (1853), and 'Morphologie und Physiologie der Pilze,' etc. (1866). Since De Bary the rapid development of the subject is well represented by the works of Hartig (1874–80), Frank (1880–90), Sorauer (1886–8), Marshall Ward (1889–1901). The last work, 'Diseases in Plants,' is one of the most excellent and readable expositions of the subject that has appeared.

Health and Disease Compared.— That there is no defined line between health and disease is generally recognized by pathologists and physiologists. A plant continually varies in response to changes in its environment. There is, however, for each individual and for a given species as a whole a certain accustomed range or power of adaptation to each factor of its environment and to the various combinations of these factors. The process of natural selection operates to perfect this adaptive attuning of the individual and the species as a whole to the conditions under which they live. If these conditions are subject to great extremes of moisture and dryness or heat and cold, the natural or indigenous vegetation will be found, as a rule, equal to the emergency, while an introduced species, if developed under an environment not subject to such extremes, might be seriously injured or destroyed, and if the change is very unusual even the indigenous species may suffer. A moist, warm, cloudy spring may be followed by dry hot weather and the tender watery growth be so much dried out and checked that it may be deformed and abnormal in shape, structure, and size. This variation may be slight or it may be great. If it is slight it may have no appreciable effect on the vigor and growth of the plant. The leaves become a little firmer and smaller and more resistant to the hot, dry conditions, while the maturer leaves that can not adapt themselves to the change turn yellow and fall, cut off by the parent plant. The plant is better for the change and can live under the modified conditions with greater ease and safety.

If the variation is greater the growth of the plant may be decidedly checked, the leaves being small and many more of them shed. In still more extreme cases the tender leaves may be dried up and killed either wholly or in part. According to Hartig, "It is only when the sickly condition leads to the death of some part of the plant that we may speak of actual disease." Where a few leaves, unable to adapt themselves to a changed condition, turn yellow and fall, the leaves themselves may be diseased, but the plant as a whole is benefited by their loss by being relieved of sources of uncontrolled drain of its water supply. As the loss of leaves becomes greater, however, we pass from the extremely localized disease to a point where the whole or a considerable part of the plant is weakened, either by the direct loss of food that should be furnished by the leaves to the rest of the plant structure, or by the use of reserve food in the reproduction of lost parts. It is evident in such cases that the border line between health and disease is hard to define. The case is not much easier if, instead of variations produced by moisture and temperature, we consider those caused by insects or fungi. A few leaves eaten from a tree by some insect or destroyed by a fungus might have no injurious effect on the tree as a whole, and might even be an advantage, but as the number of injured leaves increases the tree is weakened and

1-6. Brand-fungi (Ustilagineae) of Oats and Wheat, with Spores. 7-10. Potato Rot. 11-15. Rusts, showing effects on leaves. 16. Leaf affected by Hymenomycetous Fungi (Oidium). 17. Oidium-growth 18-23. Ergot-fungus, showing development and effects.

its life threatened. Slight doses of certain poisons stimulate the cells to more vigorous growth, acting as a tonic, while a little larger dose poisons and destroys the cell. Leaving all questions of consistency of definition, we may practically define as diseased all those conditions of a plant which directly or indirectly endanger its life or prevent normal development under given conditions of environment. Or, as Marshall Ward puts it, "We may define disease as dangerous disturbances in the regularity, or interference with the completeness or range of the molecular activities constituting normal life — that is, health — and it is evident that every degree of transition may be realized between the two extremes."

Classification of Diseases.— The method of classification adopted is more a matter of convenience than importance. Most writers in plant pathology base their classifications on the causes of disease. Frank, for example, adopts the following outline: (1) Effects of insufficient room or space; (2) Effects of wounds; (3) Diseases due to atmospheric influences; (4) Diseases due to soil influences; (5) Diseases due to the action of injurious substances; (6) Diseases due to injurious plants; (7) Diseases due to injurious animals; (8) Diseases without any noticeable causes.

Hartig discusses diseases of trees according to the following scheme: (1) Diseases induced by Phanerogams; (2) Diseases induced by Cryptogams; (3) Wounds; (4) Diseases due to unfavorable conditions of soil; (5) Diseases due to unfavorable atmospheric conditions. While a classification based on cause is more scientific and more convenient for the pathologist, classifications based on the plant, the part of the plant attacked and the symptoms, are the most intelligible and convenient for those who devote themselves to the practical cultivation of plants. According to such an arrangement we should have diseases of roses, carnations, violets, lilies, wheat, corn, oats, rye, apple trees, peaches, plums, maple, alder, birch, etc. Under each head we could subdivide into diseases of roots, stems, leaves, flowers, and fruits, and again according to symptoms — decay or loss of parts, swellings, galls, shrinking, cankers, spots, discolorations, etc., finally coming down to the causes. It cannot be too strongly urged that pathologists writing for practical men adopt this latter type of classification at least as a key for the identification of specific diseases, as Hartig has done in his excellent work on the 'Diseases of Trees.' In practice we have in plant pathology, the same as in animal pathology, first carefully to examine, determine, and interpret the symptoms (diagnosis), then to find and study the causes (ætiology). We are then in a position to determine curative measures (therapeutics) or preventive measures (prophylaxis).

The general survey of the subject of plant pathology as planned in this article is based on the following classification:

I. Constitutional conditions — predisposition and immunity.

II. Diseases without apparent cause.

III. Diseases caused by the non-living environment.

- (*a*) Conditions of soil or substratum.
- (*b*) Atmospheric conditions.
- (*c*) Temperature.
- (*d*) Light.
- (*e*) Electricity.
- (*f*) Shock or jars — mechanical.

IV. Diseases caused by the living environment.

- (*a*) Antagonistic association, crowding, isolation, etc.
- (*b*) Vegetable parasites.
- (*c*) Animal parasites.

Constitutional Conditions — Predisposition and Immunity.— A plant may be likened to a very delicately constructed and complex machine automatically adjustable under certain conditions and capable of running and doing work if properly supplied with energy. The accurate and perfect working of the machine depends first upon the perfection of its construction and adjustment, down to the minutest detail. If it comes from the manufacturer with a wheel or screw missing, or the parts incorrectly adjusted or made, it must do its work, if at all, with more or less imperfection, and we may consider that the mechanism has a constitutional difficulty or imperfection. Perhaps a new machine is assembled from parts of old ones so differing from each other that it becomes impossible to produce a perfectly co-ordinated mechanism. Some of the variations that occur in the constitution and organization of plants during the processes of reproduction and development are of the nature of such imperfect construction or adjustment. When these imperfections endanger the life of the plant we have a constitutional disease, or at least a predisposition to disease.

Predisposition to disease may be normal or abnormal. Normal predisposition is where some perfectly normal condition of growth makes the plant liable to injury. Young cereal plants, for example, are liable to infection by smuts, while older plants are quite resistant. When the formation of young, tender growth coincides with the spore dissemination of some fungus or the prevalence of some insect best able to attack growth in such condition, the plant is at this stage normally predisposed to such attack. In the same way there may be normal predisposition to injury by cold, light, heat, etc., but in no case of this kind could the predisposition be considered in any sense disease. Abnormal predisposition is where some abnormal change takes place in the plant from any cause which lowers its vitality or resistance, and which is in itself a pathological condition. Wounds and mechanical injuries may permit the entrance into the plant of insect or fungous parasites, as is the case with many of the wood rot fungi. Injuries from cold or heat may reduce the normal resistance to parasites. Plants which have been severely chilled during rapid growth, though not to the point of killing or even freezing, are often unable to resume normal growth even under the most favorable conditions. They appear to be partially paralyzed and are in this condition extremely subject to insect and fungous attack. So may predisposition develop as the result of starvation, overfeeding, or unbalanced nutrition even before the initiative pathological changes have become chronic.

Genera, species, and individuals vary among themselves in liability to disease or resistance to it as they do in other ways. Races resistant or immune to certain unfavorable conditions or

parasitic enemies are common in nature, and may develop as the result of natural selection, or more quickly and certainly as the result of artificial selection of a natural tendency. If a natural tendency to resistance is not present in a given species, race, or variety, it may be introduced into new generations through the processes of breeding and selection combined. The production of plants for special purposes resistant or immune to certain diseases, is proving of immense value to agriculture. On the other hand, both in natural and artificial selection and breeding, non-resistant or sensitive individuals, varieties, and races may develop or be developed unusually subject to disease.

Seedless or non-fertile individuals may result from too close fertilization, or where the parents are too distantly related; or if seeds are produced in such cases, the individuals grown from the seeds often lack in vigor or reach an incomplete or imperfect development the same as in animals.

Many species of plants, like the violet, strawberry, lilies, and bulbous and tuberous rooted plants in general, are naturally propagated by vegetative offshoots, runners, buds, bulbs, etc., and by seeds. The seed generations under normal conditions are usually the most vigorous and variable. Take, for example, plants from the seeds of *Lilium harrisii* (Bermuda lily), derived from crossing individuals of the same variety, as compared with plants from bulblets of the same individuals propagated for many years by bulb generations, and note the differences. The plants direct from the seed and from the bulbs produced by the seedling generation are relatively much more vigorous than the plants from bulbs distantly removed from a seed generation. The latter are much more sensitive than the former to the attacks of aphides and red mites on the leaves and the bulb mites on the bulbs and roots. The latter are also more sensitive than the former to fungous parasites, and to unfavorable conditions of the non-living environment. The same is true of the cultivated violets, especially the varieties that are propagated from runners and seldom produce seed on account of the doubling of the flowers. Long continued asexual propagation appears in these cases to gradually reduce the power of individual adjustment or adaptation to changes in environment, resulting in decreased vigor and resistance to unfavorable conditions. On the other hand, there are many varieties of plants thus propagated that do not appear to suffer in this way. That it is the cause of predisposition to disease in some cases, and even constitutional derangement, must not be overlooked in the study of the ætiology of a disease.

Diseases without Apparent Cause.— Under this head a number of obscure but well-defined diseases are grouped, the ætiology of which is still unknown. Among these are the California vine disease, peach yellows, and peach rosette, little peach, some forms of gummosis of the stone fruits, die back of the orange, and a score of other diseases, apparently contagious, though the cause has not yet been found.

Variegation.— Formerly variegations were included in this class. These are characterized by the development of white, yellow, or colored spots, blotches, segments, stripes, or bands in the otherwise apparently normal green leaves. The transition from the diseased to healthy cells is usually sharp and well defined from the youngest to the oldest stages of the leaves or other tissues involved. Any particular cell is subject to the disease only while in a state of active division. It therefore never spreads to a cell that has stopped dividing. The diseased cells are usually smaller than healthy cells, and are of much slower growth. The nucleus and protoplasm are more vacuolate, but the most apparent change is in the development of the chloroplast and the chlorophyll. The chloroplasts may be reduced in number and size, and the chlorophyll may be reduced or entirely absent. The change in the diseased cells themselves is often progressive, starting with a reduction of chlorophyll, gradually fading to yellow, then to white as the cell matures. In many cases the disease is transmitted through the seed and is thus hereditary. In others it is propagated only by division of the original plant by buds, cuttings, etc. When a variegated bud or branch is grafted into young, rapidly-growing tissues of a normal or healthy plant of the same variety, branches formed above and below the graft often become variegated, demonstrating that the disease is thus transmissible or infectious. When it once appears in a plant it is very persistent, especially when it has gone to the point of involving the seed generation. Sometimes, however, a plant which has been producing variegated growth suddenly returns to the normal green. While such changes are usually classed as spontaneous variations, they differ in many respects from normal variation. Recent investigations by the writer and others have demonstrated that variegations, including the so-called mosaic diseases, develop as the result of certain disturbances of nutrition of the young dividing bud cells. Certain substances (oxidizing enzymes) present in the cells in an inactive form or in small amount become active or increased in quantity and prevent the development of chlorophyll or cause it to fade. These enzymes injected into the growing points of healthy buds, as demonstrated in the case of tobacco, cause the disease in all dividing cells infected. We have here, then, a toxic enzyme produced by the plant itself under certain disturbing conditions capable of producing the same disease whenever the enzyme comes in contact with dividing cells. The abnormal increase in this enzyme may be brought about in several ways — as by a chill during rapid cell division, severe cutting back, root injury, or defoliation, followed by the production of new growth in the absence of sufficient reserve food, especially proteid. Consult Bulletin 18, Bureau of Plant Industry, United States Department of Agriculture.

All forms of variegation weaken the tissues involved and make them more subject to insect and fungous attack and more easily injured by cold or high temperature. Besides this the changes are in themselves strictly pathological, and threaten or cause the premature death at least of the parts affected.

Albinism.—When the loss of the green coloring matter is complete and apparently spontaneous, not curable by addition of some lacking nutrient, it may be classed with variegations. Other forms of albinism, yellowing or chlorosis are brought about by lack of iron, excess of lime, carbonic acid, lack of light, etc., and will be further discussed when these factors are

considered in relation to disease. The cure and prevention of diseases of this class must be based on securing and maintaining a correctly balanced nutrition for the young cells — protecting them from shocks, especially those due to temperature variations. Peach yellows and rosette, California vine disease, die back of the orange, and diseases of this type can be controlled only by rooting out the diseased individuals upon the appearance of the first symptoms. At the present time we know no cure for these particular diseases. In many respects they behave like variegation or mosaic diseases

DISEASES CAUSED BY THE NON-LIVING ENVIRONMENT.

From what has been said in previous paragraphs, it is evident that unfavorable physical and chemical conditions of the soil, excessive dryness or moisture of the soil or atmosphere, unfavorable conditions of temperature, light, etc., may cause derangements resulting in temporary or chronic disease. Plants which have become adapted by natural or artificial selection to a certain range and sequence of soil, moisture, temperature, and light conditions usually suffer some sort of derangement if exposed to a set of conditions materially different in any particular factor, group of factors, or in the relation of these to each other. It is absolutely necessary, therefore, in studying the ætiology of diseases to know the natural or constitutional requirements of the plants and their powers of adaptation. This knowledge can be obtained only by long and intimate acquaintance with the kind of plants in question under varying conditions.

Soil.— In natural conditions it is a matter of general observation that certain varieties of plants thrive best on particular kinds of soil, the same as in particular conditions of light, temperature, and moisture. The storage and movement of water in soils and its availability to plants, the solution of soil foods, nitrification, temperature, and aëration depend largely upon the structure or physical composition of the soils. Water, food, air, and temperature are among the fundamental requirements of vegetation. It is the varying amounts and relations of these factors maintained by a given soil that largely determine whether or not it is *naturolly* suited in a given region to a particular class of plants. Where all these conditions are under easy control the kind of soil is a matter of less importance. The work of furnishing and maintaining proper conditions is done by the gardener instead of by the soil in the latter case. It is not profitable, however, to employ soils that require close and constant attention, even where conditions are largely under control. It is the aim of economical production to select a soil for a given crop that, with a minimum of labor expended on the part of the cultivator, produces the desired results. It is evident from these considerations that the conditions of the soil must be considered in connection with all of the other factors of environment, as no one of them ever acts independently and alone in the production of disease. The plant, too, has to be considered. It may be adapted to withstand the variations that take place in a sandy soil in a locality characterized by particular meteorological conditions, while it could not thrive in a clay soil in the same locality. On the other hand, with changed meteorological conditions the same plant might do best in the clay soil.

Root Suffocation.— This is one of the most usual diseased conditions caused by physical conditions of the soil preventing the ready access of atmospheric oxygen or the ventilation of the soil. A very fine sand closely packed, or a clay soil with a crust excludes the air, unless the sand is stirred or the crust broken. Carbon-dioxide accumulates and the oxygen is reduced. The root hairs and feeding roots die for lack of sufficient oxygen for respiration. Growth is checked by starvation due to reduced root action. The tissues become hard and woody. The plant may then die in dry, hot weather by desiccation, or it may simply starve to death. Plants injured in this way, even slightly, often become the prey of insects and fungi, especially of those that attack the roots. This form of suffocation is also often found where the roots of plants have to grow under close pavements or hard packed ground or heavy sod. Another form of root suffocation results from poor drainage or excess of moisture in a soil, thus excluding the oxygen and preventing soil ventilation. The feeding roots die and ferment, not only cutting off the proper absorption of soil food elements but resulting in poisoning the plant by products of fermentation. The leaves rapidly turn yellow and drop, and unless the soil is dried out and aërated the plant soon dies. This latter form of root suffocation is very common among plants grown in pots or tubs. When the natural drainage is stopped up or the plant is over-watered, the soil becomes sour.

The best thing to do in such cases is to repot the plant into fresh soil containing a little lime or wood ashes, first washing off the old soil and trimming off the diseased roots. Good drainage must be furnished and over-watering avoided. It must be clearly understood that the roots of all plants require an abundant supply of oxygen, and that they will suffocate and die if they do not get it.

Poisonous materials in the soil are also often the cause of serious root injury. Illuminating gas leaking from gas mains or pipes and diffusing through the soil in the minutest quantity kills and poisons the roots of all kinds of vegetation. The only thing to do in such cases is to stop the leak and air the soil.

The decomposition of organic matter, especially manures rich in nitrogen, in soils not well supplied with oxygen, results in the formation of products injurious to the roots of plants. Injurious acids are often set free from their combinations in the soil by the action of plant roots, bacteria, and fungi, and by chemical changes brought about by the use of certain fertilizers, like the acid of superphosphates. In all those cases a liberal addition of lime to the soil acts as a cure to the injured plant and corrects the acid condition.

Alkali Soils.— In some cases, on the other hand, there is too much lime or other alkaline material such as carbonate of soda, etc., in the soil. The root hairs and feeding roots are killed by a sudden rise of a soluble alkali, or they may die a slow death if there is too much lime. It is a curious fact that a liberal addition of gypsum tends greatly to reduce the injury in both these cases and to raise the limit of endurance

of most crops to alkali. Where alkalies can not be washed out of soils through proper drainage, much can be done by breeding and selecting varieties of plants better adapted to such conditions. Great progress has already been made in this direction with alfalfa, sugar beets, cereals, date palms, etc.

Soil Nutrients.— Every green plant requires for its healthy development, besides water, oxygen, and the CO_2 of the air, a certain proportion of nitrogen in the form of nitrates or ammonia, a salt of potassium and of phosphoric acid, available calcium and magnesium in about equal proportion, sulphur, and a trace of iron and chlorine. If these are not available to the plant in the right form or ratio, or if any of them is too greatly in excess or lacking, a diseased condition of the plants in such soils quickly develops.

Nitrogen.— Lack of nitrogen in available form causes a proportionately diminished vegetative growth, light green or yellowish leaves, even where there is abundant moisture and other nutrient materials. An excess of nitrogenous fertilizer, on the other hand, causes various pathological derangements. Abnormal vegetative growth at the expense of flowers and fruit thus inducing temporary sterility is one of the commonest results of a food containing too much nitrogen in comparison with potassium and phosphoric acid. The tissues in such cases are likely to be soft and watery, easily injured by unfavorable temperature or moisture conditions as well as by insect and fungous parasites.

Tissue degeneration is in many cases the result of over-feeding with nitrogenous fertilizer. This appears to be one of the commonest causes of "die back" or gummy degeneration of the orange. Peaches and plums also suffer from a similar malady from the same cause. Large gum pockets develop in the wood as a result of the degeneration of the cells. The movement of water and food materials in the plant is greatly interfered with. The wood does not mature properly and as a result winter kills, or is destroyed by insect and fungous parasites.

Phosphoric acid is an important constituent of every living cell, entering largely into the composition of the nucleus. Its reduction below the cell requirements is followed by a cessation of cell division and growth and in green cells by disorganization of the chlorophyll which first becomes reddish, then yellow. These latter changes take place first in the maturer leaves, then in the younger parts. An application of phosphates or superphosphates usually promptly corrects these pathological conditions.

Potassium also is required in considerable quantity by all plants. One of the first signs in a plant of a lack of available potassium is a decided cessation of growth without other apparent cause of trouble. During the early stages of potash starvation the plants often retain their normal green color. In later stages very little starch or sugar is made and almost no protein or nitrogenous matter. Unless the missing element is supplied the plants finally become yellow and slowly die. Potassium hastens and perfects the maturing of plants, especially the ripening of the wood of perennial plants, making them less liable to winter injury.

Calcium.— Lack of this element in plant nutrition is first indicated by a more or less marked yellowing of the young leaves due to a reduction in number and size of the chloroplasts though the chlorophyll itself may be normal. The starch made by the chloroplasts is converted with difficulty into sugar. This retardation is probably due to the fact that in calcium starvation the production of the starch transforming enzyme (diastase) is greatly reduced.

Magnesium.— While this element does not appear to be of such fundamental importance to the vegetable cell it is nevertheless absolutely required, especially during the periods of flowering and fruiting. A very small amount may often suffice to meet the requirements of growth up to the flowering period, but at this time a decided lack of magnesium results in the failure to set fruit or its failure to mature. With a more decided lack normal vegetation soon ceases, proleptic shoots develop with shortened stems, small, distorted, yellowish leaves crowded together in rosettes somewhat resembling potash starvation except in color.

It appears to be necessary that magnesium and calcium always be associated in plant cells except in some of the lower classes of plants. The ratio of one part of magnesium to three of calcium is the most favorable in many cases though this is quite variable for different species. In a large number of cases an excess of magnesium over calcium results in greatly retarded growth and an early death of the cells.

Both magnesium and calcium oxides (lime) play a secondary part in the soil by combining with the acids set free by root action, fermentations, and other biological and chemical processes. If these were not at once combined the root hairs and feeding roots would be injured or killed and the plant would suffer from general starvation if not actual poisoning.

Sulphur.— This element usually absorbed by plants in the form of sulphates is one of the absolute requirements of all organisms. It enters into the structure of protoplasm and the more highly organized nitrogenous foods, proteids, required as the direct food of growing cells. Its abnormal reduction results in the cessation of proteid manufacture and consequently causes proteid starvation. Growth ceases and death follows unless the element in some available form is supplied.

Other elements and compounds are often important to the plant though not required. Silica for example is found very commonly deposited in the cell walls of plants, especially in the epidermal cells of cereals and grasses. Its presence stiffens the stems and leaves and in a measure protects them from biting and sucking insects and other small animals. Aside from decreased resistance to such attack a plant grows as well without silica as with it.

Chlorine.— This element in very small quantity appears to be necessary to the vigorous growth of plants, especially during the formation of flowers and fruit. In excess it is usually injurious except to plants adapted to soils rich in chlorides, such as sugar beets, asparagus, celery, etc. It is an interesting fact that sugar beets and celery are rendered much more resistant to spot diseases caused by Cercospora when well supplied with sodium chloride, than without it. Why this is so has not been determined.

Iron.— A small amount of this element is necessary to the formation of chlorophyll. An insufficient amount of iron is indicated very quickly by the formation of chlorotic or white leaves which become green on the addition to the soil of a soluble iron salt, such as iron sulphate. Often the failure of a plant to obtain iron is due to the death of the root hairs and feeding roots from various causes, alkali or acid, excessive moisture or dryness, insect or fungous attack, etc. In such cases, however, there are indications of general starvation as well as of lack of iron, and the diseased condition can be cured only by removing the cause of the death of the roots.

Atmospheric Conditions.— The close co-ordination between the conditions affecting the plant in the soil and atmosphere is at once apparent. In most of our ordinary plants water, with various materials in solution, is absorbed by the roots from the soil and passes up through the stem to the leaves and other parts above ground. From these there is a continual loss of moisture, regulated in part by the plant, but depending largely upon whether or not conditions of the atmosphere, light, etc., favor evaporation, or transpiration as it is more correctly termed where living plants are under consideration.

Moisture Variation.— Plants growing in soil and air uniformly moist have smaller root systems and a larger total leaf surface than they would have if grown under constantly varying conditions of soil and atmospheric moisture. A plant reared in a moist greenhouse will gradually shed its older leaves if the air is allowed to become too dry or the plant is removed to an ordinary dwelling room. The new leaves that develop under such circumstances are adapted to the drier air and are better able to retain the water furnished by the roots. If, however, the change from moist to dry is too sudden, the defoliation will be excessive and the new growth may develop very slowly and be poorly nourished. In the case of house plants there is almost a universal tendency to over-water the plant at such times. This brings on suffocation

and death of the root hairs and feeding roots, and ends in death of the plant. Instead of watering under such conditions the soil should be allowed to become comparatively dry until renewed growth of leaves creates a demand for water from the roots.

Plants which have been growing for a considerable period with a comparatively small water supply develop a large number of root hairs, and firmer and smaller leaves adapted to reduce transpiration to its lowest terms. If a cloudy, wet period suddenly follows, or the plants are over-watered, they become gorged with water. The more plastic tissues start into growth, with the result that the leaves often become distorted, wrinkled, curled, or twisted. If there is a continued excess of moisture many of the root hairs and finer roots may die, and symptoms of root suffocation develop, the leaves become spotted with yellow and finally drop off.

Œdema is a pathological condition characterized by the formation of water blisters or warts on the stems or along the vascular bundles of leaves over-gorged with water. This diseased condition often develops in plants growing in moist situations, especially under conditions where the soil is likely to be warmer than the air, thus favoring absorption of water by the roots but not favoring transpiration through the leaves. The disease often develops, also, in extended periods of moist, warm, cloudy weather.

Burning or Scalding.—The growth that plants make under cloudy, moist conditions is often watery and soft, an easy prey for parasitic fungi, and likely to dry out, wilt, and die easily if suddenly exposed to clear, hot weather. Such "burning" or "scalding" of the edges and tips of leaves is very common in the spring, when moist, cloudy periods are suddenly followed by clear, hot days.

Wind often causes injury by whipping and tearing the leaves or breaking limbs. In the latter case injuries are produced which predispose the plant (especially trees and shrubs) to attack by insects or fungi. Wherever possible all such injured parts should be cut out to uninjured tissue, and protected by antiseptic washes or grafting wax. Dry, hot winds coming early in the summer often cause the death of tender foliage by desiccation.

Injurious Gases.— Slight traces of illuminating gas escaping in rooms or greenhouses, or the slightest trace of sulphurous fumes from burning coal from furnaces or stoves, is extremely injurious to vegetation. The presence of these gases in the atmosphere causes the gradual yellowing, browning, and finally the death of leaves, especially the tips and edges. Although the soil, temperature, and light conditions may be the most favorable, the plants gradually die where they are more or less constantly exposed to a trace of these gases. In the neighborhood of factories or large cities vegetation is often injured, as described, by these and other poisonous gases. In some cases the amount of poisonous gas thrown into the air with the smoke from certain factories is so great that vegetation of all kinds is unable to thrive in the neighborhood. The injury extends often several miles from the factory in the direction of the prevailing wind.

Temperature.— Many predispositions to disease, as well as specific pathological conditions, are produced in plants as the result of unfavorable temperature conditions. As a rule, when growth is taking place and the cells contain much water, vegetation is most sensitive to heat and cold. When growth has ceased and the tissues are mature or in a resting or dormant condition and contain much less water, they are least sensitive to heat and cold. The temperature range for any individual during growth, and even in the dormant or resting condition, varies for different individuals, varieties, and species. These temperature ranges have become more or less fixed within certain limits for different individuals and species through the influence of the temperature factor in the environment under which the species or individuals have developed. Thus, plants adapted to long growing seasons of the South will not thrive in the shorter, colder season of the North. On the other hand, many plants adapted to northern conditions do not thrive in the South. When an individual or a species becomes adjusted or accustomed to the conditions and changes of a particular environment it may be unable wholly or in part to adjust its life processes to an unusual change in any factor or group of factors or the relation of these to each other. The orange, lemon, lime, and numerous other subtropical fruits, for example, do not have a well-defined resting or dormant period like the apple, pear, peach, etc., in the North. They would therefore be quickly killed if exposed to severe frosts.

Certain varieties of peaches and plums which survive Northern winters without injury, when planted in the South often winter-kill. Extended warm spells in the latter part of winter, and the warming effects of the sun on the south and southwest sides of the trunk start the activity of the cambium, which is subsequently injured or killed by freezing, the same as are young buds pushing out too early in the spring under the influence of warm days and then caught by the late frosts.

Varieties that start into growth readily under such conditions may be completely winter-killed if the conditions are such as to stimulate a general premature activity. If only the tissues warmed by the direct action of the sun are involved, patches of various size may be killed. These usually start near the surface of the ground on the southwest side of the tree, and extend up the trunk to the limbs, varying in width from a few inches to the whole south and southwest side.

Winter Sun Scald.— This term is usually applied to cases like those just described where smaller areas on the south or southwest side of trees are illed during winter by the successive warming and freezing of the tissues. This form of injury is common in the North and West. Considerable protection may be afforded in all such cases by coating the tree with whitewash or protecting it from the direct action of the sun in some way.

Winter Desiccation.— Evergreen trees and shrubs are often killed or greatly injured during periods of bright, warm weather in the winter by rapid evaporation of water from the leaves while the ground and roots are frozen and unable to replace what is lost.

Another form of winter desiccation is through the direct action of freezing, where, by intense

cold, the water is drawn so completely from the protoplasm into the cell walls or intercellular spaces in the formation of ice crystals that the cells are unable to re-absorb water on thawing. This effect of freezing is similar in many respects to that of drouth. Water is withdrawn from the protoplasm to a greater or less extent, according to the duration and severity of the cold and the retaining power of the protoplasm. If the withdrawal has not been too great, and thawing process is slow so that the cells can gradually re-absorb what was given up in freezing, the plant may suffer no harm. If on the other hand, the tissues are thawed rapidly, the air is driven out of the intercellular spaces and the cells may die for want of oxygen or the water may be lost by evaporation before it can be reabsorbed. Frozen plants should therefore be thawed slowly and protected from evaporation by sprinkling with cold water or shading. While most cases of injury from freezing are due to the conditions just described, there is another class of cases where the injury is apparently due to structural and chemical changes in the protoplasm induced by the cold.

Cold Rigor.— As already pointed out, the sensitiveness of protoplasm of various plants and at various stages of growth differs remarkably, but in all cases during vegetative activity there is a point either a little above or below the freezing point of water where protoplasmic movement and growth cease without the cells being necessarily frozen or killed. This condition is known as cold rigor, and is often taken advantage of by florists and gardeners in holding their flowers or fruits temporarily in some particular stage of development for a particular market period. Usually when the temperature is raised the growth continues normally, but occasionally, if the temperature is a little too low and long continued, the plant fails to respond again to a higher temperature and is found to be in a state of permanent rigor or paralysis; though the plant does not die, it makes little or no growth.

Mechanical Separation of Cells.— In many parenchymatous tissues, leaves, bark, parenchyma, fruits, etc., which can stand considerable freezing without injury to the protoplasm, there is more or less rupture of the cells from each other by the formation of ice in the cell walls or intercellular spaces. In some cases the epidermal cells are almost completely separated from the rest of the tissue. In other cases, as in apples and bark parenchyma, the individual cells may, in extreme cases, be separated and form a powdery mass. If the separation is complete the cells die after a time. In any case, even a partial separation and breaking of the protoplasmic connections between the cells interferes with normal development, and may cause the premature death of the whole or parts of the plant by interfering with the movement of food materials, etc.

Frost-cracks.— These usually occur as the result of rapid freezing and shrinking of the outer tissues of trees, especially while the inner tissues are relatively warm. After the cold period is over and warmer weather comes such cracks close up.

Frost Canker.— This name is applied to wounds that are prevented from healing through the action of late frost in killing the callus rings as they develop. The killing of roots and the lifting of plants from the soil by freezing are familiar phenomena to all gardeners, but further consideration of this subject can not be undertaken here.

Scorching or Burning.— Sometimes in hot, dry weather smooth-barked trees and shrubs may have portions of their tissue exposed to strong sunlight actually killed by the high temperature. In light-colored, sandy soils the reflection of heat from the sand often kills the lower leaves of low-growing trees, shrubs, and especially of herbaceous plants. The reflection of sun heat from the south or west side of buildings, etc., may also cause similar injury. The direct injury in such cases is often, however, confused with the effects of excessive transpiration. The burning effect of hot, dry winds is largely due to the excessive transpiration they induce. The burning is especially severe when there is an insufficiency of soil moisture as the result of drouth or lack of proper cultivation.

Sudden Variations of Temperature.— As already indicated, the injury resulting from changes of temperature above the maximum or below the minimum for a species or individual depends in large measure upon the rapidity of the change. If the change is slow, even the individual plant may adjust its vital processes to temperatures which would have resulted in death had they been sudden. Some of the algæ, for example, live in hot springs at a temperature of 93° C., while the original stock from which these forms were derived lives in water rarely exceeding 40° C. A transfer of individuals from 40° to 93° would result in almost instant death, while by slow, gradual change they could be accustomed to this extreme temperature. For flowering plants (Phanerogams) the possible maximum is much lower, 50° being the extreme limit, while the average limit is from 37° to 46°.

Sudden variations well within the fatal limits, however, are productive of pathological changes. A rose, tomato, violet, or almost any other plant grown at a cool temperature (8° to 15° C.), all other conditions remaining the same and then suddenly exposed to 24° to 27° C., will turn yellowish, become weak and spindling and very sensitive to insects and parasitic diseases. The same plants, started at 24° to 27° and growing normally at that temperature, if suddenly dropped to 15° or 8° become yellowish and weak and very sensitive to parasite enemies. In either case the change from one temperature to the other could be made without serious injury if made gradually and slowly. For a general discussion of this subject with references to literature, consult Davenport's 'Experimental Morphology.'

Resting or Dormant Period.— A resting or dormant period is more or less well defined in many perennial plants. In northern and temperate latitudes this period coincides with cold weather and has developed in response to this constantly recurring seasonal change. In other cases in hot climates a partial rest may occur during the dry season. In many cases this period of rest has come to be a necessity to the normal and healthy development of the plant. Detmer and Müller-Thurgau have shown in the case of potato tubers and many dormant buds that in the fall and early winter the tissues contain only enough sugar to meet the demands of

respiration of the dormant cells, not enough to stimulate growth. Müller-Thurgau has demonstrated that exposure of tubers dug in August to 0° C. for a few weeks causes an accumulation of sugar sufficient to start normal germination when the cooled tubers are placed under favorable conditions. The cold reduces the amount of sugar used in respiration and probably also causes an increase of diastase, the enzyme that converts starch into sugar. The same has been shown to be true also in the case of the dormant buds of many trees and shrubs. Exposure of dormant buds, bulbs, tubers, etc., to sulphuric ether for several days has a similar effect to that produced by exposure to cold. In the case of plants that have their dormant or resting period in dry weather there is an accumulation and modification of reserve foods preparatory to the next season of growth. Buds, bulbs and tubers may often be forced to grow before they have accumulated sufficient reserve food in the proper form, but the result is usually a weak plant very subject to disease. A good example of this may be seen in the attempt that is often made to force bulbs that are immature and that have not had their normal period of rest or have been forced the previous season. Variegation or mosaic disease is also often produced in this way.

Light.— Practically all the chlorophyllaceous plants are dependent upon sunlight for normal development and activity. Every individual and every species is adapted or attuned to a particular range of light intensity, and suffers injury if the intensity becomes too great or too small, or if the change from one intensity to another is too sudden.

Injury from Strong Light.— Many bacteria and fungi, for example, *Bacillus anthracis* and *Botrytis cinerea*, grow best in darkness or very weak light, but are killed in a short time by exposure to sunlight or to artificial light strong in the blue-violet rays. It is this portion of the spectrum that causes the chemical disorganization of the protoplasm, or rather its destruction by oxidation as in the absence of oxygen during exposure no change takes place. The same is true of the more highly developed chlorophyllaceous algæ and shade plants — too strong light not only destroys the chlorophyll by oxidation induced by the blue-violet rays, but the protoplasm itself may finally be thus killed or chemically disorganized. This is also well shown in the injurious effect of the ultra-violet rays in the naked electric arc light. A glass globe which cuts off these rays prevents the injury. This pathological condition in varying degrees of intensity is produced not only in shade plants when exposed to direct sunlight, but also in other plants when grown in the shade and suddenly exposed to strong light. It is also common when an extended period of cloudy or foggy weather in the spring is suddenly followed by bright, clear days. Under such conditions there is not only a partial destruction of the chlorophyll, but an excessive loss of water from the poorly cuticularized leaves. Such leaves are also unable to close their stomata quickly, which is another reason for their suffering from excessive loss of water. The action of light in promoting evaporation or transpiration is mainly by raising the temperature of the tissues above that of the surrounding air. When the air temperature is very high the increased temperature of the tissues of plants exposed to strong sunlight is often sufficient in itself to cause injury or death.

Injury from Weak Light.— While too strong light can not be endured by any plant, lack of light is injurious only to chlorophyllaceous plants. When the light intensity is reduced below the minimum for any of these plants the synthesis of carbon and nitrogen compounds is reduced accordingly until in very weak light or darkness the plant can make no use whatever of the carbondioxide of the air. That the plant will starve in proportion to the reduction in photosynthetic activity is evident.

Electricity.— That electrical conditions of the earth and atmosphere and of the plant have an important relation to the physiological condition of the latter has been demonstrated in many cases, but the full significance of this relation is not yet understood. Plants vary in sensitiveness to electric currents in much the same way that they do to light or heat. A current above the maximum for a plant causes the disorganization and death of the protoplasm. This is often accomplished by a comparatively weak direct or alternating current, but is perhaps most familiar in cases of injury or death from currents of high intensity, as from electric light wires or lightning stroke.

Mechanical Injury.— Finally, among the causes of disease in the non-living environment, we have to mention mechanical injuries, such as those produced by hail, wind, falling trees, etc. Hail stones often severely cut and tear the foliage of trees and herbaceous plants, and may also produce more or less serious wounds in the more resistant tissues. Wind may injure the foliage, break limbs, etc., as may also falling trees. In all these cases, except in the most severe forms, the greatest danger comes from the entrance into the tissues of the wounded plant of parasitic insects and fungi. Large mechanical wounds, however produced, should have antiseptic treatment where practicable, especially in large and valuable trees. The injured parts should be trimmed to healthy tissue in such a manner as to favor rapid formation of callus. After a wash of some disinfectant, such as copper sulphate 1 per cent solution in water, the wound should be protected by shellac or grafting wax, or white lead paint.

DISEASES CAUSED BY THE LIVING ENVIRONMENT.

Struggle for Room.— The results of crowding are so familiar and apparent that discussion of the subject is scarcely required. The strong plants occupy the soil with their roots and the air space with their leaves and branches, crowding out the more backward or weaker individuals or species. Some are thus starved to death, others are reduced in size and vigor according as they lack the proper space in which to grow.

Plant Associations.—Plant associations spring up controlled by certain dominant species. Each individual of such a community has its influence on the others. The shade of a tree keeps back some sun-loving species and makes it possible for shade-loving species to grow, and so, with countless inter-relationships, plant communities develop, often of great complexity. If the tree or other dominant factor is removed the changed conditions are followed by a breaking-up and readjustment according to the new conditions. Many of the former occupants of

the area will be starved or crowded out in the struggle. Others may suffer from excess of light or too high temperature. Disregard of the natural requirements of plants and their interrelations in communities often leads to disastrous results in clearing or planting in landscape gardening.

Symbiosis.— This term was first used by De Bary to designate plant partnerships such as those represented by the co-operation of fungi and algæ in the formation of organisms known as lichens. The fungous hyphæ surround the algæ cells and furnish them with water and dissolved salts from the substratum, and the algæ in return supply to the fungus hyphæ the required organic nutrient materials. The community forms in itself a specific vegetable organism, though under favorable conditions of nutrition both the fungus and the alga forming the lichen may live independently of each other. Another type of symbiotic relationship is found in the so called *Mycorhiza*, or fungus roots. These are specially common on plants growing in humus. Two types are distinguished, one where the fungus is in close external union with the roots, covering them with its filaments and preventing the formation of root hairs, actually taking their place by supplying the plant not only with water and mineral food but also with organic nutriment from the humus. These external associations are usually termed ectotrophic mycorhiza.

Monotropa hypopitys is a good example of a non-chlorophyllaceous plant dependent upon ectotrophic mycorhiza for its food. Among forest trees the phenomenon is very common, especially in the *Cupuliferæ* and *Abietineæ*. That the fungus mantle in these cases supplies the host with food materials from the humus has been amply demonstrated. Ordinarily the host plant in these cases furnishes little or nothing to the fungus, which is able to obtain all its nutriment from the humus. In some cases, however, the Mycorhiza fungus has been observed to penetrate the root sheath and become parasitic. It is a short step from this condition to the cases where the fungus is normally internal, forming the so-called endotrophic mycorhiza, as in many of the *Orchideæ, Ericaceæ, Epacrideæ, Empetraceæ*, and representatives of other groups living in humus soils. In many of these cases, while the plants are not in any way apparently injured by the fungus, they can thrive as well without as with it, and the relation of the fungus to the host has not as yet been fully investigated. Among the *Leguminosæ*, however, the case is different. All legumes in their native soils have their roots covered with "tubercles." These develop as the result of stimulation produced by certain bacteria which enter the young roots through the root hairs and grow symbiotically within the cells. The bacteria draw their organic nourishment from the stores in the root, and in return secure nitrogen directly from the atmosphere which afterward becomes available to the legume. Legumes with these tubercle bacteria can thrive in a soil absolutely devoid of nitrogen, whereas, without the bacteria, they could not live at all in such a soil. The failure of legumes to thrive in certain soils is often due to the absence of these tubercle organisms. On the other hand, the tubercle organism often degenerates into a mere parasite. Similar organisms are also found in symbiotic relation in the alder and in several other groups of plants.

Vegetable Parasites. The true vegetable parasites (obligate parasites) are those which can not, in any phase of existence or stage of development live independent of the host plant. There are many true parasites both among the higher and lower orders of plant life. Many organisms, however, are parasitic during certain stages of their development, and saprophytic in other stages; where the parasitic nature is predominant they are called hemi-parasites; if the saprophytic phase predominates they are classified as hemisaprophytes. All of these classes are responsible for the production of diseases of various types. The true saprophytes, which live entirely on dead organic matter, are seldom the cause of diseases. The diseases of plants due to vegetable and animal parasites constitute by far the larger number of diseases and are those of greatest economic importance. In some cases, as previously suggested, it is difficult to determine whether we are dealing with a harmless symbiotic relationship or one where the host is more or less injured. In this doubtful category, for example, are to be placed the mistletoes (*Loranthaceæ*). These plants possess leaves containing chlorophyll, and are related to their host the same as a scion to a stock. The true mistletoe of Europe (*Viscum album*) and its relatives in America (*Phoradendron flavescens*) are parasitic on a great variety of deciduous trees, and sometimes do considerable damage. Here also must be placed those endotrophic mycorhiza of many plants growing in humus where neither benefit nor injury has been shown as a result of the presence of the fungus in the roots. Among the phanerogams, however, there are many true parasites, for example, the *Orobanchaceæ*, which are devoid of chlorophyll and derive all their nourishment from the roots of the host plants to which they are attached. These parasites often do considerable damage to tobacco, hemp, lucerne, clover, and other crops. The Dodders (*Cuscuta*) are also true phanerogamic parasites, deriving all their nourishment from their host plants, which they overrun and penetrate with their sucker roots (haustoria). The most dangerous and prolific disease-producers, however, are the pathogenic fungi and bacteria.

Pathogenic Fungi.— The consideration of diseases caused by pathogenic fungi is usually based upon the fungus, and the genetic relationships of the fungi usually determine the order in which the diseases are discussed.

While this practice is undoubtedly the best one to follow in a systematic treatise, it is probably the cause of the erroneous impression sometimes encountered that the fungus is the disease. The disease is the functional or cell derangement of the plant or part of the plant. The same functional or cell derangement, and therefore strictly the same disease, may in some cases be produced by a great variety of totally unrelated causes. More attention should be given in plant pathology to the study of the disease itself, though not less attention should be paid to the determination and study of the cause. This latter course is especially necessary in the case of the pathogenic fungi, bacteria, or insects. A complete and accurate knowledge of the life history and nutritive requirements of pathogenic organisms furnishes

the best foundation on which to base the procedure for preventing or controlling the diseases caused by them. As already suggested, there is every possible gradation among the pathogenic fungi, between the strict saprophyte (such as sooty molds), causing disease only by chance association, and the strict parasite (such as rusts and smuts), unable to exist independently of their living hosts.

Among the diseases caused by strict saprophytes may be mentioned the starved and chlorotic condition of many leaves and fruits due to the presence of sooty molds on their surface. These black, mold-like fungi grow in sugary excretions, especially the "honey dew" excreted by insects, aphides, scales, leafhoppers, etc. This black growth, where it covers the surface of leaves, occasionally cuts off so much light that the chloroplasts lose their green color, and the formation of starch and sugar is so greatly reduced as to cause partial starvation and general retardation of growth of the whole plant. This is intensified by the injury produced and the food removed by the insects.

Many of the saprophytic yeast fungi, molds, and bacteria cause fermentive decomposition in the weakened and dead cells of the wounded tissues, especially those rich in sugar or other reserve materials. Toxic products are thus produced which weaken or kill all the cells absorbing them. Such fermentations are especially common following mechanical injury to ripening fruits and to the sapwood of trees, in the latter case particularly following the work of borers. Fungi of this class grade imperceptibly into the hemisaprophytes or facultative parasites which start their vegetative development in dead or weakened tissues like the heartwood of a tree or the dead tissue of a wound, and then gradually spread into the living tissues, killing them. The best examples of this class are the wood-destroying *Polyporeæ* (bracket fungi), *Agaricineæ* (toad stools), and related fungi. When these get into the heart-wood through a wound, or into an area of dead cambium bark or sapwood, they first fill the dead area with their mycelium and gradually spread into surrounding living tissue, in some cases by secondary action through decomposition products, or by cutting off the water or food supply from the living tissues, or by primary action, where the mycelium spreads from its saprophytic vantage ground directly into the neighboring living tissue.

In order to prevent wound infection of woody plants it is necessary either to keep the surface of the wound dry, preventing the exudation of sap and the entrance of water by searing with a hot iron, or by treating the injured surface with an antiseptic or protective coating, paint, or wash, such as coal tar, white lead, copper sulphate, etc.

Besides the hemisaprophytic wood-destroying fungi which gain entrance through wounds and are not able otherwise to infect a sound plant, there are others of the same class, such as *Agaricus mellcus*, whose mycelial strands or rhizomorphs are able to work their way through the sound bark of numerous conifers, underneath the bark and in the wood of which the fungus produces dense white, felt-like mycelial membranes. These kill the bark and wood and stimulate an excessive flow of resin into the injured parts, finally resulting in the death of the tree. This same fungus also attacks deciduous broad-leaved trees, but here it is more particularly a wound parasite.

Botrytis, Pythium, Sclerotinia, and many other fungi, though able to pass the whole of their existence as saprophytes, are also able under favorable conditions to infect the living tissues of plants and destroy them. It is a short step from these fungi to those of a slightly more decided parasitic nature, the *hemiparasites,* organisms which can not in nature complete their life history as saprophytes. The *Ustilagineæ* (smuts) are among the most familiar examples of this class. These grade imperceptibly into the strict parasites such as the *Uredineæ* (rusts), which can not live at all as saprophytes.

Among the strict parasites there is often a high degree of specialization, a given species of fungus being restricted in many cases to a particular genus or even species of plant. In some of the rusts there is a peculiar phenomenon of this nature known as heteroecism. Many species of rusts go through their whole life history producing all their various forms of spores on the same host. In other cases, however, spermatia and æcidiospores are produced on one host and the uredospores and teleutospores of the same fungus are produced on an entirely unrelated host.

Injury Caused by Parasitic Fungi.— It is extremely difficult to classify the various reactions of plants to parasitic attack. Every case has to be considered in a large measure individually. There are, however, certain general types of reaction and injury that may be noted. There are many parasitic fungi, for example, that attack the leaves of plants; some of these, like the powdery mildews, grow only on the surface of the leaves and younger stems, forming powdery, whitish spots or coatings and drawing nourishment from the surface cells by sending down into them short, root-like growths, *haustoria.* When these surface parasites attack the young growing leaves, stems, or fruits, the areas occupied by the fungus are greatly retarded in development, often causing more or less distortion of the leaves, and in severe cases often killing them and causing early defoliation. The flowers and fruit may thus also be destroyed. The proper ripening and maturation of the wood of perennials is often so much retarded by these direct and indirect effects that it winter-kills. When these fungi, however, attack only a few leaves on a plant, or where they attack the leaves after they are full grown, the injury is comparatively slight. Prompt burning of the fallen leaves in autumn is one of the best preventive measures. Sulphuring, so widely practised in the case of vine mildew, helps to rid plants of the fungus, and spraying with Bordeaux mixture is a good preventive as well as curative treatment.

Besides these external parasites there are a large number which penetrate and vegetate directly in the cells or in the intercellular spaces of the host. Some of these after a time kill the tissues in which they are growing, producing a dead area. If these dead areas are in the leaves and are numerous or large, the value and working power of the leaf may be seriously impaired or destroyed altogether. The destruction of the first crop of leaves often results from the attack of leaf-spot fungi early in the summer, and the plants are obliged to put out a

second crop of foliage. This must be done at the expense of reserve food stores. In such crops as sugar beet, Irish potato, etc., this use of reserve food becomes evident in the reduction of yield of tubers and sugar. In crops like beets and potatoes, where there is a continual succession of new growth, a second attack is not so serious as in the case of trees and shrubs where two successive defoliations either kill the plant outright or so weaken it that it winter-kills or dies of starvation. The weakening effects of premature defoliation are often not fully realized. Where one premature defoliation has occurred from any cause, great effort should be made to protect the second crop of leaves and to stimulate the plant with nitrogenous fertilizers. If the plant is a perennial, some protection, if possible, should be furnished during winter, as the wood is likely to be poorly ripened. Practically all the leaf-spot diseases are easily controlled by spraying the foliage with Bordeaux mixture or other good fungicide. Immediate removal, if possible, and burning of the diseased leaves also serve to hold these diseases in check.

If prompt action of this kind is taken when the trouble first appears it may often be checked without other treatment. It is safest, however, to spray other plants with a fungicide whenever practicable.

Many fungi which may start by attacking the leaves are not limited to them, but spread to or even directly attack the stems. The *Peronosporeæ*, or downy mildews, are good examples of this class. Plants which have developed in moist, cloudy weather are particularly sensitive, and the parasite starting in leaves or stems may in a few days invade all the tissues of the plant, causing a rapid soft rot. The well-known "potato rot," often causing the complete destruction of the crop in a few days, is caused by one of this group of fungi. Many other crops are similarly affected by fungi of this group. Like the leaf-spot fungi, these are easily prevented from gaining entrance to the tissues of plants by keeping them well sprayed with Bordeaux mixture or other good fungicide.

The root rot and damp-off fungi — *Rhizoctonia, Ozonium, Agaricus mellcus, Botrytis, Pythium, Fusarium,* etc., usually attack the plant through the roots or base of the stem, and cause a more or less rapid decay of the invaded tissues, followed by the starvation and death of the whole plant.

The cultivation of resistant individuals or the use of uninfected or sterilized soil and attention to general cultural conditions, especially rotation of crops, drainage, and aeration of soil, are the best preventive measures for diseases of this type.

In other cases stems and leaves may be invaded by fungi (rusts or smuts), but rotting or sudden death of the tissues does not occur. The plants may, however, be so reduced in vigor that they fail to mature. The cereal rusts, for example, often greatly reduce the yield of grain. In case of the smuts the grain is replaced by the spores of the fungus, but the plant is apparently not otherwise injured.

Hypertrophy.— In some cases the tissues attacked by fungi are stimulated to excessive growth. Finger and toe disease of turnip roots caused by *Plasmodiophora*, plum pocket and "leaf curl," "witches' brooms," etc., caused by *Exoascus*, the large galls on *Vaccinium* and *Rhododendron* caused by *Exobasidium*, the large swellings produced on conifers by *Peridermium*, etc., are good examples.

Pathogenic Bacteria.— The casual relation of bacteria to numerous animal diseases has been the subject of much careful study, but until recently there were only a very few plant diseases known to be caused by these organisms.

Among the best known examples may be mentioned the "fire blight" of pomaceous trees, especially pear and apple. The tops of the trees are killed back as if burned by fire. The bacillus causing the trouble is carried from tree to tree by bees and other insects. The principal infection is through the nectaries of the flowers, and possibly, also, through the glands or water pores of the young leaves. The twigs are usually killed back for a few feet, then as the wood begins to mature the bacteria usually die, except where they have invaded a large limb or the body of the tree. To prevent the disease being carried over from season to season it is necessary only to find and remove all these latter sources of infection.

A bacterial disease of the English walnut on the Pacific coast is a serious menace to the culture of these trees. A bacterial gall or tumor of olive trees is serious in Europe, and has appeared in some of the olive groves of California. Among the bacterial diseases of vegetables may be mentioned the bacterial rot of the tomato, egg plant, and Irish potato, carried by biting insects, the brown rot of cabbages, and a bacterial disease of sweet corn entering the tissues through water pores in the edges of the leaves. Numerous other plant diseases have been shown to be due to bacteria, and the number will probably be greatly increased as the field is more carefully worked.

Diseases Caused by Animals.— Next to diseases of vegetable origin, those caused by animals, especially insects, are the most numerous and destructive. Many fungus and bacterial diseases are carried from plant to plant by insects; for example, pear blight by bees, potato rot by potato beetles, ferment and wood-rot fungi by boring beetles, etc. In the case of pear blight the bees, though they are carriers of the disease, are beneficial to the trees in aiding pollination. In other cases the injury caused by the insects may in itself be serious. The biting insects may in some cases cause more or less complete defoliation, or the sucking insects and mites may so reduce the stores of plant food as to seriously interfere with growth. Among the best known and most injurious of these are the scale insects, mealy bugs, plant lice (*Aphidæ*), leaf hoppers, and the "plant bugs" (*Capsidæ*). All of these feed on the sap of the plant by sucking it out of the tissues, but causing little or no mechanical injury to the cells. In many cases there is simply a general or local retardation of growth due to the removal of sugars and proteids; in other cases irritations are set up, possibly by some material injected into the tissues by the insect, resulting in gall-like swellings or various hypertrophied developments of the parts attacked, for example, *Phylloxera* on the leaves and roots of grape; woolly apple louse (*Schizoneura*) on roots of apple; *Colopha*, cockscomb gall on elm, etc. In other cases the growth of the tissue is checked, as where tis-

sues are attacked by scale insects such as San José scale, and by many of the plant lice and leaf hoppers. In other cases growth is neither checked nor accelerated, but definite spots are produced which continue to enlarge, resembling a fungus or bacterial infection (*Stigmonose*) or puncture diseases, etc.

Borers may more or less completely ring a tree, cutting off the connection between root and leaves and thus resulting, in many cases, in death. Hypertrophy of tissues is also often the result of insect attack. Many insect larvæ developing from eggs laid in young tissues cause, by the irritations they set up, growths known as galls. Nematode worms attacking the roots of plants also cause gall-like swellings.

As in the case of the fungi, the complete life history and habits of any particular injurious insect must, as a rule, be determined before the greatest success in controlling it can be attained. Many insects have their natural enemies, which, if favored, may hold a serious pest in check. The development of natural resistance in plants by selection is also an important means of preventing injury in certain cases. And finally, the use of insecticides must be resorted to, as arsenic, etc., for biting and eating insects, and contact poisons for sucking insects.

ALBERT F. WOODS,
Chief Pathologist and Physiologist, Bureau of Plant Industry, Department of Agriculture.

Disentis, Switzerland, a village in the canton Grisons, situated on the Hither Rhine. It is about 31½ miles southwest of Reichenau, and 3,600 feet above sea-level. The monk Sigisbert, a disciple of Saint Columba, is supposed to have founded a large Benedictine monastery here in 614. Pop. (1900) 1,400.

Disestab'lishment, specifically the depriving a Church of its rights, position, or privileges as an established Church; withdrawing a Church from its connection with the State. A bill for the disestablishment of the Irish Church was introduced into the British House of Commons by Gladstone 1 March 1869. It was passed by Parliament within a few months of its introduction but did not take effect till 1 Jan. 1871.

Disfran'chisement, the act of depriving a person of any privilege, liberty, franchise, or immunity, such as depriving a member of a corporation of his corporate rights. It is distinguished in this case from "amotion," which refers to the removal of an officer of the corporation from office, without affecting his membership. Another instance is the act of depriving a person of the rights and privileges of citizenship. This term is often applied to the act of depriving a citizen of the right to vote, and in Great Britain to the Act which deprives a constituency of the right to return a member to Parliament.

Dishonor, the refusal or omission of the drawee of a bill to accept, or of the acceptor of a bill, or of the maker of a promissory note to liquidate the obligation, on its maturity. There are generally three parties in a bill or note transaction, the holder, the drawer, and the person by whom the bill or note is payable, whether he be the maker or acceptor of it. In case the bill or note is dishonored, the holder must at once notify the endorser and the drawer, if the paper be a draft or bill. Then the drawer, if there be funds of his in the hands of the drawee, will have an opportunity of withdrawing them. If a banker refuses to pay a customer's check, while holding an account of that customer sufficient to meet such check, he makes himself liable for damages.

Disinfec'tants, agents used for destroying or rendering inert the germs of infectious diseases. It has been amply proven that a large number of diseases are of microbic origin, and when these low forms of microorganisms are introduced into the body of susceptible individuals they multiply and thereby become capable of producing certain diseases, which are called infectious. Any agent capable of destroying these organisms is a disinfectant or germicide, and through disinfection we have a powerful and effective means of controlling these diseases and checking the spread of them.

In order to disinfect thoroughly, we must first trace the source of infection. In the eruptive fevers, such as measles, scarlet fever, smallpox, etc., the infectious agent comes directly from the body, attaching itself to the clothing, bedclothes, etc., and to objects handled by the infected person. The same is true of infectious skin-diseases, such as barbers' itch, ringworm, etc. In pneumonia, tuberculosis, diphtheria, and whooping-cough, the sputum and the breath take the germ of infection; in cholera, the alvine discharges, and possibly vomitus; in typhoid fever infection is largely due to the specific germ found in the discharges from the bowels; in malaria, anthrax, and elephantiasis, the germ is found in the blood; in hydrophobia it occurs in the saliva, spinal cord, and brain; in gonorrhœa, in the urethral discharges, etc. Some of the infecting agents do not multiply outside of the body, while others under favorable conditions are very procreative; therefore the object of disinfection is to destroy all infected material and, where this is not admissible, to subject it to a process of disinfection inimical to the life of the infecting germ. This must be complete and thorough. The selection of an appropriate disinfectant for each germ is the result of laboratory research. A culture of a germ is made in a medium best adapted to its propagation, and by experimenting with various agents one (or more) is found which proves most destructive to the germ, in the shortest possible time. The best and cheapest disinfectants known are supplied by nature, namely, sunlight and air.

Fire and heat are the most powerful disinfectants known. In the use of heat various kinds of mechanical apparatus for both dry and moist (superheated steam) heating are used. Boiling infected clothes, with or without the addition of a chemical disinfectant, is a popular means of disinfection. Where it is impossible to use either of these agents, gaseous elements are introduced. Cold (freezing) is a natural disinfectant, but fails in the case of typhoid germs, which have been known to resist freezing after 103 days; and the same is true of the tuberculosis germ. Camphor, medicated papers, or the burning of incense, may clear an odorous atmosphere impregnated with sewer-gas or fumes of decomposing animal or vegetable matter: but these are not disinfectants.

Of late the utility of disinfection has been forcibly demonstrated, and most cities and quarantine stations have established plants for steam disinfection. Clothing, bedding, etc, known or believed to be infected are placed in chambers or cylinders and subjected to a pressure of superheated steam (220° to 230° F.) for 20 or 30 minutes. This thoroughly disinfects all infected material. Dry heat is not so effective. The ideal disinfectant for all practical and domestic purposes, both inexpensive and easy of application, is chloride of lime in the proportion of six ounces to a gallon of water. All typhoid or cholera stools, likewise the sputum of pneumonia or tuberculosis patients, are rendered innocuous by it in less than 30 minutes. Carbolic acid in the proportion of four ounces to a gallon of water will destroy most bacilli, but not their spores. It is highly poisonous, and very destructive to the skin, therefore to be used with caution. Corrosive sublimate, in proportion of one part to 1,000 parts water, is not only an efficient disinfectant, but a powerful insecticide as well. It can be applied to woodwork, walls, floors, etc., but its corrosive action on metal renders its uses limited on sewers, drains, and the like. Milk of lime or common whitewash, so highly recommended by the German government in the cholera epidemic of 1892, is a ready and efficient means of disinfection. This may be prepared by sprinkling a quart of quicklime in a suitable vessel and, when the lime is reduced to a powder, adding three or more quarts of water, allowing the mixture to stand. It may then be applied with a brush to walls, floors, etc. Drains are flushed, and all excreta from infected cases treated with equal parts of lime solution.

The use of chlorine and sulphurous gases is objectionable because of their irritating qualities. Sulphur fumes are falling into disuse, in consequence of the foul odor and failure to accomplish the end sought. A more modern disinfectant is made by subjecting methyl-alcohol to oxidation, and is commonly known as formalin. It is readily soluble in water, does not destroy clothing or furniture, and is virtually non-poisonous. It is used in the preservation of meat and food, for disinfecting surgical instruments, for the washing out of sinuses and of indolent and foul ulcers, and for the disinfection of dwelling-rooms. Solid formaldehyde being introduced into a generator and burned, the resulting gas quickly penetrates all cracks and crevices, and renders the air clean and pure, besides destroying all infectious germs.

Most of the metallic and acid disinfectants are more or less objectionable on account of their destructive action to the skin and tissues. Permanganate of potash, osmic acid, bromine, and iodine are useful in their respective places. In all cases of infectious or contagious diseases disinfection should be complete; articles infected should be burned, boiled, or disinfected, and not buried or thrown into sewers before being treated with a proper disinfecting agent, for infecting germs have been known to lie dormant for years.

Disinfection, popularly speaking, the process of destroying infectious organisms. Various modes of general disinfection have been in use for a number of years, most of which are extremely crude and inefficient. It is becoming recognized more and more that a general mode of procedure for dealing with infectious organisms is of very little value, and it is becoming more and more evident that individual disinfection for each and every type of disease-producing organism is necessary. Thus the old-fashioned mode of disinfection in yellow fever, by means of steam, heat, chlorine gas, sulphur, etc., are shown to be absurd in the light of modern knowledge, as yellow fever is conveyed by means of mosquitoes, and as the knowledge concerning the cause of infectious diseases is becoming more and more definite, the means of preventing the spread of such diseases by proper disinfectants is taking on a more individual character. In any application of the principle of disinfection the first question necessary to ask is, by what agents and through what channels is a given disease propagated? Thus in diphtheria, it may be vastly more important to cleanse the throats of all persons who have come in contact with a diseased patient, than it would be to burn barrels of sulphur in a room where a sick child had lived. In typhoid fever it is now well recognized that the bacillus of the disease is eliminated in the fæces and in the urine, and that flies and small animals are capable of carrying about on their feet the micro-organisms. Therefore if one would properly disinfect a typhoid fever patient, it is necessary to take great care with the fæces and urine and other excreta, and, as far as possible, exclude all insects from the room. Of the value of general disinfectants, such as the burning of sulphur in a room, or the use of formaldehyde gas, or the cleaning out of ships and railway cars by aërial disinfectants, the writer believes them to be generally inefficient* In this encyclopedia individual prophylaxis against contagion is described under each infectious disease, and can best be consulted in its proper place. See ANTISEPTICS; BACTERIA; DISEASE; GERMICIDES; INFECTIOUS DISEASE.

*The best disinfectants are fresh air and sunlight. Steam, boiling water, and burning are the best means of cleansing clothing. Formaldehyde gas is one of the best means of ridding a large room from noxious insects, and as a general disinfectant.

Disintegra'tor, a machine in which various substances are pulverized or crushed by beaters projecting from the faces of parallel metallic disks revolving in contrary directions. There are disintegrators for ore and for grain, and one form is used for mixing mortar.

Dislocation, the displacement of one bone from another with which it forms a joint. Thus by dislocation a limb is said to be put out of joint. Dislocations are the result of either disease, accident, or congenital malformation. The displacement may be either partial or complete, and cases are classified as simple, when the skin remains unbroken, and compound where a wound lays bare the bone; when a fracture of the bones, and injury to important blood vessels aggravates the case, the dislocation is said to be complicated.

The general treatment of dislocations consists in reduction, that is, drawing back the displaced joint into its socket. The contracted muscles oppose this reduction, and sometimes their spasmodic action has to be overcome by the administration of chloroform or ether. Up to the year 1870 or thereabouts the reduc-

tion was generally effected by extension, that is, by pulling out the displaced limb, and stretching the restraining muscles until they are exhausted, when the bone would generally slip back into its place with an audible snap.

Of late years, however, reduction by extension has been to a very large extent given up in consequence of the general adoption of reduction by manipulation. This method, known it seems from ancient times, but curiously neglected, consists in executing certain complex movements of the dislocated limb which effect the return of the displaced bone to its socket by ingeniously utilizing its unruptured attachments and evading the opposition of the muscles, by fraud rather than by force. It is particularly applicable to the hip, which, as it is commanded by the strongest mass of muscles in the body, always presented the most formidable obstacles to the old method. The first paper on this subject which attracted general attention was by Dr. Reid of Rochester, N. Y. (1851); and in 1869 Prof. Bigelow of Boston published a careful and exhaustive discussion of injuries to the hip, with such full and clear directions for the manipulation method, as to secure its general adoption in the case of this joint by surgeons in Great Britain as well as in America. The method, however, had been described and used in France and elsewhere, though with less care and precision, in the earlier half of the 19th century.

In cases of congenital dislocation of the hip bone and other congenital misplacements of the bones, manipulation, intensified into powerful massage, has been developed practically to a wonderful extent by Dr. Adolf Lorenz, an Austrian surgeon who has lately visited this country. See Lorenz, Adolf.

Dislocation (in Geology). See Fault.

D'Isly, Duke. See Bugeaud, Thomas Robert.

Dismal Swamp, Great, a tract of marshy land, beginning a little south of Norfolk, Va., and extending into North Carolina; containing 150,000 acres; 30 miles long, from north to south, and 10 miles broad. This tract was entirely covered with trees, with almost impervious brushwood between them, but it has now in part been cleared and drained and is devoted to agriculture. In the midst of the swamp is Drummond's Lake, seven miles in length, the scene of Thomas Moore's 'Lake of the Dismal Swamp.' In 1899, the Dismal Swamp canal, connecting Chesapeake Bay with Albemarle Sound, which from about the beginning of the 19th century to the close of the Civil War was a famous historic waterway, was reopened for navigation. It extends from the village of Deep Creek, Va., to South Mills, N. C., a distance of 22 miles; and is one of the most important links in the chain of inland waterways extending along the coast from New York to Florida. A marked advantage of the restored canal is that it enables shipping to avoid the dangers of Cape Hatteras; another is that it will furnish the means of inland and protected navigation for the smaller vessels of the navy and the revenue service. Although only 22 miles long it opens up 2,500 miles of inland navigation. The improvement of this canal cost the United States government nearly $1,000,000. Little Dismal and several smaller swamps are along the coast of North Carolina; area, about 2,000,000 acres.

Dismas, Saint, according to ancient legends, based on doubtful authority, the name of the penitent thief who died on the cross beside Jesus Christ.

Dispart', the difference between the semidiameter of the base ring at the breech of a gun and that of the ring at the swell of the muzzle. On account of the dispart the line of aim makes a small angle with the axis, so that the elevation of the latter above the horizon is greater than that of the line of aim. In modern guns the dispart is of little practical consequence on account of the present placing of the sights.

Dispen'sary is literally a place where medicine or food is weighed out for distribution; in our own day the term is applied to a charitable institution where medical and surgical aid are given without charge to those who desire or need them. Such dispensaries are found in most large towns of the United States and Europe. In the Old World they originated in the monasteries. The Royal General Dispensary, Bartholomew Close, London, is the oldest dispensary in England and was founded in 1770. The oldest in the United States was opened in New York in 1795.

Dispensa'tion, in canon law, is the relaxation of a law in a particular case: it is an act for which the lawgiver is competent as regards laws enacted by himself or by his predecessors to whose powers he succeeds. It is claimed for the Supreme Pontiff that he can dispense in matters where the *jus divinum* springs from a human act of will, as in vows and promissory oaths (Liguori): in such case casuists hold that the Pope does not do away with the *jus divinum* but removes the ground of the obligation of oath or vow: in the words of Aquinas, "He determines what is pleasing to God." The claim of power in the Pope to do this rests on the power granted to St. Peter, of loosing and binding. Bishops by their ordinary power can dispense from the laws and statutes of their own diocese, and from general laws of the Church by virtue of powers delegated by the Pope, as in most vows and in the laws relating to fasts, abstinences, observance of holidays, etc.

Dispen'satory, a work of reference, concerning itself more particularly with the subject of materia medica and therapeutics. Dispensatories are not official volumes, such as pharmacopœias. They represent solely the opinions of scholars who are hired by publishers to issue at more or less regular intervals such works of reference. They are usually encyclopædic in character. At the present time there are two recognized dispensatories widely in use in the United States, the 'National Dispensatory' and the 'United States Dispensatory.'

Dispenser, dĕ-spĕn'sẽr, **Hugh le,** English jurist: b. about 1210; d. Evesham 4 Aug. 1265. He was justiciar of England in 1261 and during the war of the barons with Henry III. joined the former. He was killed at the battle of Evesham.

Disper'sion, an optical term applied to the angular separation experienced by the component rays of a pencil of light on emerging from a refracting medium, whose surfaces are not

parallel to each other, as in the case of the common prism. The refractive index of a transparent medium is different for different kinds of light. Thus, when white light passes through a given prism, the rays of different refrangibility of which it is composed are bent by different amounts from their original common direction. They are said to be dispersed. The dispersion for the given prism depends upon the difference of the refractive indices of the extreme rays of the visible spectrum. It varies with the substance and the angle of the prism. The relative breadth of any two parts of the spectrum varies with the substance of the prism. This constitutes the so-called irrationality of dispersion. In general, rays of short wave-length are more refracted than rays of long wave-length, but in some refracting media this law breaks down in part. This is known as anomalous dispersion. The term false dispersion is applied to the scattering of light by reflection from motes suspended in a transparent medium. See LIGHT.

Displayed, a heraldic term used to describe the position of an eagle or other bird with its wings expanded.

Dispossess, in law, to put out of possession, to dislodge and evict; to deprive of actual occupancy, particularly of real property. Dispossess *proceedings* are begun against a tenant who is then served with a dispossess *warrant*, and ejectment from the premises follows. See EJECTMENT AND EVICTION.

Disraeli, dĭz-rā'lĭ, **Benjamin.** See BEACONSFIELD.

D'Israeli, Isaac, English author: b. Enfield, Middlesex, May 1766; d. Buckinghamshire 19 Jan. 1848. His father, Benjamin D'Israeli, was the descendant of a family of Spanish Jews which had settled at Venice in the 15th century to escape the persecutions of the Inquisition. In 1791–3 appeared his 'Curiosities of Literature,' the most entertaining of his works, and that by which he is best known at the present day. Its success was such as to determine D'Israeli to pursue the same path through the literary field, the collection of instructive and amusing gossip relative to literary men and their writings. From this period up to 1812 he appears to have been principally engaged in the collection and preparation of literary materials, the results of his labors appearing in the following works, published between that year and 1822: 'Calamities of Authors'; 'Quarrels of Authors, or Memoirs of Literary Controversy'; and 'Inquiry into the Literary and Political Character of James I.' These were afterward published collectively under the title of 'Miscellanies of Literature.' In 1828 appeared the commencement of his 'Life and Reign of Charles I.,' a work completed in 1831. In 1841 appeared his 'Amenities of Literature.' D'Israeli was a man of a pensive and solitary turn of mind, and his life was quite that of a literary recluse, spending the greater part of his time in his library. A memoir of him, prefixed to a new edition of his 'Curiosities of Literature,' was published by his son, Benjamin Disraeli, afterward Earl of Beaconsfield (q.v.).

Disruption, the name commonly applied in Scotland to the act by which, in 1843, about 400 ministers gave up their livings to vindicate principles which they held to be essential to the purity of the Church, and in harmony with its earlier history. They held themselves at liberty to return when the Church which they had left had abandoned the opinions on civil and ecclesiastical government which had caused the rupture. See FREE CHURCH.

Dissection, the process of studying the parts or organs of animals or plants by cutting or tearing operations. Practically, no complete knowledge of the structure of organized bodies can be obtained in any other way than by complete dissection, and in human anatomy its place in the curriculum is most important. The dissection of human bodies in the study of anatomy has probably taken place as long as we know the history of civilization; although, in certain countries and at certain ages, the practice of human dissection has been forbidden by certain ruling classes, — at one time the Church, another time the state, another time the aristocrat, at another time public opinion. At the present time, however, dissection of the dead body is recognized to be a prime essential to the study of medicine, and throughout all civilized countries it is widely practised.

Dissection Wounds, wounds made by cutting instruments, during the process of dissection, which differ from ordinary wounds of accidental origin, largely in their greater liability to become infected by pus-producing bacteria. The human body after death makes an excellent host for a number of these septic organisms, notably the staphylococci and streptococci. It is by the entrance of these usually present organisms into the wounds that this ready infection takes place. Often dissection wounds prove fatal by the extension of the infection, with resulting blood poisoning. Great care should be taken by all students of anatomy as well as by undertakers and their assistants in order to avoid accidents of this kind. See BLOOD POISONING; PYÆMIA.

Disseizin, dĭs-sē'zĭn, or **Disseisin** (Fr. *dessaisir*, to disseize, deprive of), is the dispossessing one of a freehold estate, or interrupting his seizin. Under the feudal law, when a vassal was admitted to an estate by the ceremony of investiture, he was said to be seized of it. The disseizing of him was the turning him out of his fee. This term is synonymous, in modern law, with «adverse possession.» There is also what is called in law disseizin by election, when a property holder chooses to consider himself disseized of certain real estate, in order to avail himself of remedies at law applicable only to a disseizee.

Dissenters, the common name by which in Great Britain all Christian denominations, excepting that of the Established Churches, are usually designated, though in acts of Parliament it generally includes only Protestant dissenters, Roman Catholics being referred to under their specific name. The most important bodies of English dissenters are the different bodies of Methodists, the Congregationalists, and the Baptists; and of Scotch dissenters, the United Free Church. The term nonconformists is often used as synonymous with dissenters. For its historical significance, see NONCONFORMISTS.

Dissep'iment, a division of the ovary; a true dissepiment is formed when the carpels are

so united that the edges of each of the contiguous ones by their union form a septum. Each dissepiment is formed by a double wall of two laminæ: when the carpels are placed side by side, true dissepiments must be vertical and not horizontal. A spurious or false dissepiment is formed when the divisions are not joined by the union of the edges of contiguous carpels. They are often horizontal, and are then called phragmata. In the Cruciferæ they are vertical.

Dissociation, in chemistry, is the resolution of a substance into other substances, whose molecules have a simpler constitution; but the word is usually applied only to those reversible resolutions in which the secondary products are capable of recombining to form the primitive substance, when the conditions that led to the dissociation are removed or reversed. Dissociation is therefore to be contrasted with "decomposition," for the latter word is used without any implication as to the subsequent behavior of the products into which the primitive substance is resolved. Dissociation, in the usual sense of the word, is induced directly by the application of heat, and many cases of it have been exhaustively studied. Calcium carbonate may be taken as an example. When this substance is heated in a closed vessel it parts with a portion of its carbon dioxide and becomes reduced to a mixture of calcium oxide, calcium carbonate, and free carbon dioxide gas. The decomposition proceeds only up to a certain limit, however, and if (as in "burning" limestone for the production of quicklime) it is desired to reduce the carbonate of calcium entirely to the form of the oxide, it is necessary to provide for the removal of the carbon dioxide gas. If the operation be carried out in a strong closed vessel which contains nothing but calcium carbonate, calcium oxide, and carbon dioxide, the decomposition proceeds only until the liberated carbon dioxide attains a definite pressure called the pressure of dissociation, which is always the same for the same temperature, and bears no relation to the quantity of calcium carbonate that is present, provided some quantity of it (no matter how little) still remains. Sir James Hall showed, many years ago, that when calcium carbonate is confined in this way it may even be fused without undergoing decomposition to any considerable extent. The explanation of these curious facts is, that the carbon dioxide is continually combining with the calcium oxide in certain parts of the vessel with the production of calcium carbonate, while in other parts of the vessel the calcium carbonate is simultaneously dissociating into free calcium oxide and free carbon dioxide. The recombination proceeds with a velocity that is proportional to the density of the free gas, while the dissociation proceeds with a velocity which, for the purpose of illustration at all events, may be regarded as constant. It follows that at low densities of the gas the dissociation will proceed faster than the recombination, the result being that the density of the free gas will increase. But this will also cause the recombination to proceed faster, and finally, when the density of the gas reaches a certain critical value, the recombination and dissociation will proceed with equal velocity, and a state of apparent equilibrium will be attained. No further visible decomposition of the carbonate will take place, unless the equilibrium is disturbed by the removal of some of the carbon dioxide (in which case the dissociation will again proceed until the same critical density of the free gas is restored), or by a further increase of temperature (in which case the dissociation will proceed until the density of the gas attains to a new critical value, higher than the first one, and whose value depends upon nothing but the new temperature to which the system has been raised). Reactions such as the one here described thoroughly refute the old doctrines of chemical affinity, which taught that two substances either will or will not combine under given circumstances, according as the chemical "affinities" of the constituent elements would be more or less thoroughly "satisfied" in the possible new compound than they are in the separate substances that might combine to produce that compound. In the case considered above, combination and decomposition go on simultaneously, and the only question is, which of the two will proceed the faster under given conditions. (See EQUILIBRIUM, CHEMICAL.) The quantitative study of the phenomena of dissociation is beset with difficulties, for the extent of the dissociation cannot be ascertained with satisfactory precision in all cases. The products into which the primitive substance is resolved are (by the definition of dissociation) capable of recombining when the conditions that lead to the dissociation are removed. Hence it is by no means easy to determine what proportion of a compound is dissociated under given circumstances. When (as in the case of calcium carbonate) the primitive substance and one dissociation product are solid, and the other dissociation product is gaseous, the extent of the dissociation may be inferred by computing the mass of the free gas, from observations of its volume, pressure, and temperature. When the original substance and the products of dissociation are all gaseous, the problem becomes exceedingly difficult, and special means must be devised to fit each special case. In the case of nitrogen tetroxide, N_2O_4, which dissociates into the oxide NO_2, the degree of dissociation may be inferred optically, since N_2O_4 is nearly colorless, while NO_2 has a pronounced brownish-red color. In other cases, the extent of the dissociation may be inferred from observations of the vapor density of the mixture. This method has been used quite successfully in the case of iodine, the vapor density of this element indicating a molecular formula of I_2 at temperatures below 700° C., and I at temperatures above 1,500° C.; while at intermediate temperatures the vapor is a mixture of I and I_2. The dissociation of acetic acid vapor has been studied by the vapor density method, and also by observing the specific heat of the mixture at different temperatures, the specific heat being assumed to be greater (on account of the work done in separating the molecules) as the dissociation proceeds than it is before the dissociation begins, or after it is complete.

Certain compounds (such as sodium chloride) appear to be more or less completely dissociated when they are dissolved in water; but the constituents into which they are resolved possess certain distinctive properties that are not manifested by the resolved parts of substances that are dissociated by the action of heat. For this reason it is now usual to dis-

tinguish this particular phenomenon by a special name, and the dissociation that occurs in such cases is called "ionization." See ELECTROLYSIS; SOLUTION.

Dissolution, the resolution of any body into its smallest parts by chemical agency. In English politics, the act of dissolving or putting an end to the existence of a Parliament. It differs from a prorogation, which is the continuance of a Parliament from one session to another, and from an adjournment, which is its continuance from one day to another. A dissolution is the civil death of a Parliament; and this may be effected in three ways: (1) By the will of the sovereign. (2) By the demise of the crown. This dissolution formerly happened immediately upon the death of the reigning sovereign, but it being found inconvenient to call together a new Parliament immediately on the inauguration of the successor, and dangers being apprehended from having no Parliament in being in cases of a disputed succession, it is provided by several statutes that the Parliament in being shall continue for six months after the death of any sovereign, unless sooner prorogued or dissolved by the successor. (3) A Parliament may be dissolved or expire by length of time. As the constitution now stands the Parliament must expire, or die a natural death, at the end of every seventh year, if not sooner dissolved by the royal prerogative.

Dissolving Views, paintings upon glass magnified and thrown with great distinctness upon a screen by means of one or two magic lanterns with strong lenses, and illuminated by the oxyhydrogen light. If one lantern is used the picture is drawn out of focus gradually, and a second substituted, which is brought gradually into focus, thus producing the haze and brilliancy which have gained this sort of exhibition its name. If two lanterns are used, they are placed side by side with their lens tubes slightly convergent, so that the images may be superposed on the screen. An opaque rectangular shutter, capable of revolving vertically upon a pivot fixed midway between the lanterns, is placed before the lenses in such a position that, when horizontal, it cuts off one half of the pencil of light from each lens. When this shutter is made to revolve through a small arc, it shuts off the whole of the pencil of light from lantern No. 1, allowing that from No. 2 to pass unhindered. When the shutter is in this position the image from No. 2 falls on the screen in full distinctness; but when the shutter is made to revolve in the opposite direction, the image from No. 1 will be gradually disclosed, as that of No. 2 becomes concealed.

Dis'sonance (Lat. *dissonantia* — *dissonare*, to sound harshly). A word in music wrongly supposed by the general public to mean the same as discord (q.v.). Technically, it is a sound of two or more tones struck together which are at variance with the formation of a common major or minor chord. Thus it is an interval, one or both of whose members must move in a certain way to satisfy the ear — demanding resolution into consonance (q.v.). If the dissonance is minor or major one member only is compelled to move. If augmented or diminished both members must move, toward each other if the interval is diminished, and contrary if augmented. All augmented and diminished intervals, seconds, sevenths, and ninths are dissonances. Dissonance, however, disregards all limitations, and it is next to impossible to form rules to govern it. In recent years especially, it seems to have become a law unto itself, and appears reaching out for a new science of sound outside of natural harmony. As witnessed in the work of the new school of composers, with such men as Richard Strauss and Edward Elgar for leading exponents, it wields a new and strange power which may revolutionize the tonal world. To demonstrate the progress of dissonance in modern music it is only necessary to cite the very important part the "fifth" plays to-day even in compositions of conservative musicians. Thirty years ago this interval ("fifth") was abhorred by theorists and looked upon as an abomination. See ACOUSTICS; CHORD.

Dis'taff, the earliest instrument of spinning, a staff, on one end of which the wool or flax was rolled. The spinner held it in the left hand, and drew out the fibres with the right, at the same time twisting them. A spindle was attached to the thread, the weight of which carried down the thread as it was spun. When the spindle reached the ground the thread which was wound round it was then again fastened near the beginning of the new thread. The 7th of January is called St. Distaff's Day, because it marks the return of the women to their usual household duties, after the revels of Twelfth Day.

Distem'per, a disease of the dog commonly considered as of a catarrhal nature. In most cases a running from the nose and eyes is one of the first and chief symptoms. This defluxion becomes after some time mucous and purulent, loading the eyes and obstructing the nostrils; and whenever the animal is subjected to a draught of air, or excitement of any kind, it has violent fits of coughing combined with vomiting, it soon begins to lose appetite, its flesh begins to waste, and it becomes listless and irritable. If the disease be virulent, symptoms of affection of the brain manifest themselves, accompanied by fits, which come on especially at the sight of another dog, or by convulsive twitchings, resembling St. Vitus' dance. In such cases the dog is often supposed to be mad, and frequently destroyed in consequence. Inflammation of the lungs is not an infrequent consequence of the disorder, and the bowels are more or less affected by diarrhœa and dysenteric discharges. Protracted cases are attended by eruptions on the chest and abdomen, and the surface of the body becomes of a yellow hue. These are always fatal symptoms. In the first stage of the disease laxatives, emetics, and occasional bleeding are the principal remedies; diarrhœa should be checked by astringents, and to reduce the violence of the fits warm bathing and antispasmodics should be resorted to.

Distemper (from O. Fr. *destemprer*, Mod. Fr. *détrempe*, Ital. *tempera*), in painting, a preparation of opaque color mixed in a watery glue, such as size, white of egg, or glue. It is used now chiefly in scene painting and in paper for walls, but was employed in the higher departments of art before the establishment of oil or varnish painting in the 15th century.

Distich, dĭs'tĭk, a couple of verses making complete sense; a couplet composed of different kinds of verse, repeated in the same order.

Distillation is a technical process which results in the separation of a volatile from non- or less volatile components contained in a closed vessel (still, pot or retort), and their conversion, by the application of heat, into vapors, and subsequent condensation to the liquid state. The liquid obtained by distillation is called the distillate, and the remainder is the so-called distillation residue. When water is heated to 100° C. (212° F.), at ordinary atmospheric pressure, it boils and is converted into steam. If this generated steam is conducted through a pipe, around which cold water flows, it will again be transformed to a liquid. In the distillatory apparatus this appliance is called the condenser. The obtained liquid is collected drop by drop in a receiver. The entire process is called distillation, from the Latin word *destillare*, meaning "to drop." Accordingly the essential features in a simple distillatory apparatus are:

1. The still, pot, or retort, that is, the receptacle for the material to be distilled. In accordance with its nature, this material is heated to that temperature at which the products are volatilized.

2. The condenser, by means of which the distillates are condensed.

3. The receiver, which collects the products of distillation in a liquid state.

When distillation is properly conducted, many liquids, as for instance, water, can be purified.

Distillation of Water.— Pure water is never found in nature, as it generally contains salts and other mineral substances, organic matter, and decomposition products, partly volatile, and partly non-volatile. The non-volatile components are readily separated by distillation. Inasmuch as the former are mostly very volatile, they are received in the very first distillate of the water, so that it is customary to reject this first portion. Experience has taught that pure water is obtained by distilling three fifths of the entire amount, and rejecting the first one fifth. In some special cases, where a water has many volatile impurities which can be detected by its appearance, odor, and taste, the distillation might be rendered more difficult, as it becomes necessary to add certain chemicals to the water in order to combine the volatile components and to transform them into non-volatile bodies. The purifying of water by means of distillation, or, in other words, the preparation of distilled water, is of much practical value. In the pharmacy, in the chemical laboratory, and in many chemical industries, distilled water is an indispensable article. The transformation of the salt water of the ocean into a potable water, by means of distillation, is also of inestimable value. Pure distilled water, however, has an empyreumatic odor, and a repulsive flat taste. According to the most recent medical investigations, pure distilled water, when constantly used, is, on account of its very purity, deleterious to health. It is claimed that this water possesses high solvent properties and also absterges the mucous membrane of the stomach too much. For this reason, the odor of the water is improved by thorough aëration or carbonization, and it is made potable by the addition of pure salt or sugar, or any other desired substance. The large ocean steamers have an equipment for producing a potable water from the sea water. The fundamental elements in this apparatus are a steam generator or evaporator, in which the sea water is vaporized by means of superheated steam, which is obtained either from a special boiler or directly from the engine boilers; a condenser combined with an aërator; and a refrigerator, with which, in many cases, a filter is combined. Special constructions of this style are those of Chaplin, Rocher, Dr. Normandy, Gallé, Mazeline, Perroy, and Hocking, in which simplicity of construction and the economy of coal are the main essentials. In recent times many ships supply themselves with an especially good well water for drinking purposes, while for cooking, washing, and boiler feeding, they distil the sea water as it is required. For these latter purposes carbonating and aërating are of course unnecessary. In most cases the evaporator is directly connected with the ship's engine. The sea water which is to be evaporated is taken from the water cooling the condenser, while the steam is obtained from the steam-jacket, or an intermediate compartment of the engine. In this way, the cylinder is constantly drained and supplied with fresh steam. The most common of these constructions are those of Yarian, Pape & Henneberg, Howe & Beckwith, Pamphlet & Ferguson. The distil constructed by Jones utilizes the escaping gases for heating the water, so that the entire apparatus is situated in the chimney. In general, the distillation of water is very simple, because it is a liquid which has a constant boiling point. More heat in the distillation process simply occasions more rapid evaporation. The departing steam, unless it is heated in a special apparatus, as is done in the case of superheated steam, retains the boiling point temperature until it is cooled.

However, it is different with a mixture of various vaporizable liquids, each of which has a definite boiling point. According to the predominance of one or the other liquid, the mixture will have a varying boiling point. When the vapors passing over at different intervals are separately condensed, it is possible to obtain single components from the mixture, provided, of course, that the various components of the mixture radically differ in their boiling points. This special method of distillation is called fractional distillation.

The best-known distillation process is the separation of water and alcohol, or, in other words, the concentration or rectifying of alcoholic solutions, by means of distillation. This is a special branch of modern industry and is also a valuable source of revenue to the State.

Distillation of Spirits.— The boiling points of water and alcohol differ considerably. At normal pressure water boils at 100° C. (212° F.), while alcohol boils at 78.4° C. (173.5° F.). Consequently, it is evident that the boiling point of a mixture of water and alcohol will range between 173.5° F. and 212° F. In proportion to the predominance of alcohol, the boiling point will be lower, and as the alcohol vaporizes, the boiling point will rise until, finally, pure water is distilled at 212° F. If a dilute mixture of water and alcohol [the mash in the American distillery usually contains 5 to 10 per cent alcohol by volume (10 to 20 proof)] is distilled in a simple distilling apparatus consisting of a pot,

or still, and a worm, dilute alcohol is always obtained, and the smaller the quantity of alcohol contained in the mixture, the greater proportionately will be the amount of alcohol contained in the distillate, as is shown in the following table of Groening:

Percentage of alcohol in the boiling mixture		Boiling point		Percentage of alcohol in the vapor	
Volume	proof	Centigrade	Fahrenheit	Volume	proof
1	2	98.75	209.7	13	26
3	6	96.25	205.2	36	72
5	10	95.0	203.0	42	84
7	14	93.75	200.7	50	100
10	20	92.50	198.5	55	110
20	40	87.5	189.5	71	142
30	60	85.0	185.0	78	156
40	80	83.75	182.7	82	164
50	100	82.5	180.5	85	170
60	120	81.25	178.2	87	174
70	140	80.00	176.0	89	178
80	160	79.38	175.2	90.5	181
90	180	78.75	173.7	92	184

If the distillate obtained from a dilute mixture of water and alcohol is redistilled, a distillate containing more alcohol is obtained. Thus in four distillations of a mash having 10 per cent alcohol by volume (20 proof), a raw spirit 80 per cent alcohol by volume (160 proof) is obtained, in which the

first distillate contains 28 per cent alcohol by volume, 56 proof
second distillate contains 50 per cent alcohol by volume, 100 proof.
third distillate contains 70 per cent alcohol by volume 140 proof.
fourth distillate contains 80 per cent alcohol by volume, 160 proof.

Of course, we assume that each time the distillation is carried out completely.

Formerly, it was necessary to repeat the distillation several times, in order to obtain a highly concentrated alcohol. The first weak distillate with less than 20 per cent alcohol by volume was called Lutter. It was used for the further concentration of the alcohol. This method of concentrating alcohol was called doubling or rectification, but as this repetition was tedious and consumed much time and fuel, a shortening of the distillation process was eagerly sought for, and with the aid of suitable appliances it has now become possible to introduce a complex, separatory distillation in one operation.

The following principle is standard for the construction of distillatory apparatus. If the concentrated alcoholic vapors developed at the boiling of the alcohol-water mixture are not cooled directly to the temperature of condensation, but only a few degrees, then a greater part of the less volatile liquid, that is, water, is condensed than of the more volatile alcohol. Through this partial cooling, the remaining vapor accumulates more alcohol. This process is called dephlegmation and denotes a draining of the alcohol, as the older chemists designated the water as a component of spirit by the word "phlegma." Accordingly, the more recent apparatus in larger distilleries, in which highly concentrated alcohols are manufactured, are equipped with a dephlegmation and rectification appliance, in direct connection with the still, so that it has become possible in the column apparatus of to-day, with continual operation, to produce, from the fermented mash, a high wine free from fusel, containing 90 to 95 per cent alcohol by volume (180–190 proof).

According to the capacity of the plant, and, especially according to the kind of product, various apparatus are used in the distillery; but an enumeration here of these would lead too far, while their description properly belongs under special heads. Therefore only the main types of various distillatory apparatus are mentioned here:

1. Simple stills, with worm condenser heated by direct firing.

2. Simple stills, with closed washwarmers, in which the mash is previously heated by the latent heat of vaporization.

3. Double pot-stills, generally consisting of two superimposed stills. While the mash in the lower still is being deprived of its alcohol, the mash in the upper still is enriched with alcohol and heated by the vapors of the lower mash, until the latter after sufficient concentration is heated to the boiling point. From this time on alcoholic vapors develop in the upper pot which are cooled in a dephlegmator and absorb still more alcohol. The concentrated vapors pass over into the condenser, while the condensed liquid flows back into the upper still. Such apparatus are either heated by direct firing below the lower still, or by means of steam, which is introduced into the lower still.

4. Two, three, or more chamber charge-stills, with or without charging chamber in one apparatus, in which the single compartments are placed one over the other, and the heat from the lower serves to enrich the one above. Steam is used for heating.

All these apparatus, when heated by direct firing, are made either of copper or iron, when heated with steam are made of copper, but oftentimes made of wood, such as heavy cypress or white oak. These are more suitable for intermittent working, and are mostly used in distilleries which distil rye, whiskey, etc.

5. Continuous pure still apparatus (on account of their form called column apparatus), which are mainly used in larger distilleries, can be regarded as a combination of a larger number of small stills, in which the mash, continuously flowing from the upper compartments to the lower, constantly comes in contact with steam flowing in the opposite direction. Through this countercurrent, the rising vapors become more rich in alcohol, through the dephlegmation and rectification taking place in each of the compartments, while the mash flowing downward is constantly deprived of its alcohol until it flows from the lowest chamber as slop, free

from alcohol. The concentrated alcoholic vapors, escaping from the uppermost chamber of the column, are then liquefied in a condenser when alcohols of only moderate strength (125 to 150 proof) are to be produced; but, if very pure highly concentrated alcohols are to be manufactured, these vapors pass over into a similarly constructed rectification column, where they meet with the liquids (lutter or phlegma), returning from the dephlegmator or condenser. The vapors take up alcohol from the liquids and pass from the upper chamber of the rectifier into the dephlegmator, in which a continual countercurrent between the condensed liquids constantly takes place.

These continual apparatus are improvements of the apparatus of Coffey, which are much used in England and Scotland; Savalle, an improvement of which is used in France; of Pistorius, Ilges, Siemens, Bohm, and others. The advantages of the continual column apparatus in comparison with the simple pot-stills, are, that the mash is more quickly vaporized, that the expense for fuel is diminished and that, as a rule, a more highly concentrated product is obtained. But, on the other hand, they also require more care and attention and skilled operators. They are also more difficult to construct (therefore it is advisable to place an order with a first-class reliable firm). Besides there is a possibility that alcohol might sometimes pass off with the slop. In the simple stills this possibility is considerably reduced, so that it is still advisable for small distilleries to erect good pot-stills, because they mostly manufacture alcoholic liquors with about 50 per cent alcohol by volume (100 proof).

The alcoholic liquid obtained in the distillery with the best modern apparatus contains, besides the highly concentrated alcohol (96 per cent by volume, 192 proof), more or less fusel oil, by which the admixture of various substances besides water is meant. Up to the present time, the following impurities contained in 50 to 95 per cent alcohol by volume have been determined; acetic aldehyde, propylic alcohol, isopropylic alcohol, butylic alcohol, acetic ether, butylic ether, acetal, secondary amylic alcohol, isoamylic alcohol, isobutylic alcohol, furfurol, and various amines. In the corn and potato spirits amylic alcohol is in predominance, and therefore it is briefly called fusel oil. Technically, fusel oil is not a uniform substance, but the higher boiling part of the impurities accompanying the alcohol distillation.

Very little is known about the origin of these substances. Their presence might be due to secondary fermentations which are produced by fission fungi, schizomycetes, but the yeast itself may also have a certain influence, as certain yeast species are capable of producing fermentation products of a definite aroma and taste. For example: *Saccharomyces ellipsoideus* produces a peculiar fruit bouquet. It is well known that aging or decaying yeast furnishes a more impure product than a sound and vigorous yeast. The raw material used in the distillery must also be considered. The corn, rye, and potato fusel oil differ in composition, so that through experience one is enabled to detect the materials used, by the odor of the raw spirit. The fusel oil of the rye spirit contains, besides amylic alcohol, aromatic œnanthic ether; the molasses spirit contains the ethers of caproic acid, capric acid, caprilic acid, etc., which are very similar to the so-called oil of wine. Finally, the construction of the distillatory apparatus also influences the quality of the product. High pressure and too long a sojourn of the alcoholic vapors in the rectificator or dephlegmator are also said to be detrimental.

As it is necessary for some industries to use pure alcohol, these impurities are generally removed by either of two processes: (1) Filtration of the raw spirit through charcoal; (2) refining, by fractional distillation, or, in some cases, a combination of both.

In the manufacture of brandies, the former method is generally and successfully used, as a trace of impurity gives the brandy its characteristic aroma and taste. Finely powdered charcoal made from soft wood or bark served as the filtering medium. It is well known that charcoal, by virtue of its absorbing capacity, serves as a decolorizer and deodorant, and in order to effect thorough absorption, the spirit must be diluted to about 40 per cent by volume (80 proof). In smaller plants the filter consists of a vat packed with charcoal. The larger distilleries and refineries use a battery of iron cylinders packed with granular or powdered charcoal. Steam is conducted into the battery until the charcoal is thoroughly saturated; then the spirits flow in, displacing the steam and filling the pores of the charcoal. The larger part of the impurities is absorbed in the lower cylinder, while the remaining impurities are removed during the passage through the remaining cylinders. If a filter is ineffective, it is cut out, the spirit is drawn off, steam is introduced, which forces the distillate into the condenser. This distillate constitutes the so-called "feints." The feints is a dilute spirit, which is milky in appearance on account of the presence of fusel oil. After standing, the fusel separates and can then be utilized, while the alcoholic liquid is worked up anew. The emptied filtering cylinder is repacked with charcoal and used as the last filter. The used charcoal is either ignited in a special furnace, or else purified by means of superheated steam.

Refining of Spirits.— In order to produce an entirely fusel-free and highly concentrated alcohol, which is used for blending wine, cognac, etc., as well as for scientific and certain technical purposes, the filtered alcohol must undergo a fractional distillation. It is essential that the alcohol, whether filtered or not, be diluted to about 40 to 50 per cent by volume (50 to 100 proof).

The rectificator for refining in general is the same as the distilling apparatus, but, inasmuch as the operation is a fractional one, it is an intermittent one. The columns are equipped with caps, bells, or sieves.

Through distillation we receive:

1. The first runnings or fore-shot. This is the first distillate which contains those impurities of the alcohol which vaporize below the boiling point of the latter. Among these impurities acetic aldehyde is especially predominant.

2. Rectified fine spirit, which is divided into several distinct products, of which the first still contains some substances vaporizable at a low temperature, and the intermediate products are pure alcohol, while the last portions already contain substances which volatilize at temperatures above the boiling point of alcohol. All

of these products are separately collected at different intervals and furnish

(*a*) Wine spirit, commercially known as Cologne spirit. It contains 96 per cent of alcohol by volume (192 proof).

(*b*) Prime spirit, which is technically absolute alcohol. For medicinal purposes it meets the requirements of the alcohol deodoratum of the United States Pharmacopeia. It contains 94 to 95 per cent alcohol by volume (188 to 190 proof).

(*c*) Common spirit or high wine, commercially called "rectified spirit." It is used for blending wine and cognac, for medicinal and all other purposes when a pure, fusel-free, less concentrated alcohol than the foregoing is necessary. It contains about 90 per cent by volume (180 proof).

(*d*) Alcohol of about 88 per cent by volume (176 proof), which can be used for blending brandies as well as for preparing dilute alcohol (97 to 100 proof).

(*e*) Weaker alcohols, which are usually redistilled with the raw spirit.

(*f*) The so-called last runnings or feints, which usually contain amylic alcohol, are used in various industries, as for example, in the textile industries, on account of their solvent power over fats and oils; in the manufacture of ethereal oil and also in the chemical laboratory.

By means of filtration and fractional distillation, about 85 to 90 per cent of the raw spirit are obtained as rectified spirit, therefore it has been the object of many experiments to improve this yield.

The attempt was made to remove the fusel, by using, in place of charcoal, either soap, oil, or fatty substances. It was believed that these substances would retain the fusel. Besides these, chemical agents as soda, lime, sulphuric acid, acetic acid, nitric acid, chloride of lime (bleaching powder), the peroxides of hydrogen, lead, manganese, etc., which were to destroy the fusel, were used. Most of these agents either act only upon certain components of the fusel, while the higher alcohols remain unchanged, or else the ethyl-alcohol was more energetically attacked than the impurities.

According to "Eisenmann's patent," the fusel could be removed by means of ozonated air, but no more practical results were achieved by this process than by that patented by Bang & Rufin. At one time this latter method received much attention, as it was claimed that if the raw spirit was treated with kerosene, it would give off all its impurities to the latter.

The only successful defuselizing process is that of Traube, by which a sufficiently concentrated potash solution is mixed with the spirit in accordance with its strength, and heated to 60 to 70° C. (140 to 148° F.). Two layers are formed, the upper, which is dark-colored and foul-smelling, contains the impurities, and in the lower we find the purified alcohol with the salt solution. After removing the former, the latter is distilled in a rectificator and concentrated; 97 to 98 per cent of the raw spirit are secured by this process.

But after all, filtration through charcoal is the best practical refining process for brandies, while filtration and fractional distillation are best employed for Cologne spirits. In large distilleries the manufacture of Cologne spirit and rectified alcohol directly from the mash is both practically and technically the most advantageous when manufactured in apparatus based on Ilges' system. American coppersmiths manufacture an excellently constructed apparatus of this type. In ordinary distillation and refining, a deterioration of the material takes place, as the fermentation products of the normal mash are purer than those of the raw spirit. The presence of atmospheric air in the condenser induces the formation of aldehydes, and, in the raw spirit, foul-smelling substances. By means of slow evaporization in the rectifier fusel oil is decomposed, while in the new automatic spirit apparatus, it is obtained as fusel oil. These apparatus are equipped with very effective dephlegmators and rectificators, so that it is an easy matter to precipitate the fusel from the alcoholic vapors and to receive only the purest alcoholic vapor in the condenser. In order to prevent an accumulation of fusel in the ever-returning phlegma temperature regulators and fusel separators are attached in the latter, so that the phlegma constantly has a uniform temperature and fusel can never be in excess. The advantages of this process are not only the dispensing with rectification and filtration, but also the production of a pure valuable spirit of about 95 per cent alcohol by volume (190 proof), while the valuable and untaxed fusel is obtained as a by-product. In addition, the yield is greater, as the loss caused by rectification is avoided.

Absolute anhydrous pure alcohol cannot be made in this way, nor can it be prepared by repeated distillation, as alcohol is in itself hygroscopic and tenaciously holds on to the last traces (3 to 4 per cent) of water. This last remnant of water can only be removed by very effective dehydrating agents; as for example, freshly burned lime, anhydrous carbonate of potash, anhydrous white copper sulphate, fused calcium chloride, and especially metallic sodium. By distillation over any of these substances the water is absorbed and an absolutely anhydrous pure alcohol is produced. This process is, however, only carried out in chemical laboratories, and as a precautionary measure this alcohol is stored in small bottles with any of the above substances. This precaution is taken in order to prevent the absorption of moisture by the alcohol.

The distillation of alcohol, as in many other distillatory operations, is merely a mechanical process of purification, as no chemical change takes place, because the distillates have the same chemical composition as the original substance. Distillation is only a mechanical separation of the secondary ingredients from the principal one. Some substances, as for instance, glycerine, when distilled in presence of atmospheric air, will decompose. In such cases the distillation is done in a partial vacuum. By means of an air-pump air is withdrawn, until the boiling point is lowered to that degree at which the distillation can take place without decomposition. It is well known that matter will boil at a lower temperature, when the pressure is decreased; and that decomposition is less liable to occur. Again, other substances cannot be distilled in the presence of much oxygen, so that carbonic acid, hydrogen, or other gases are forced into the still. These gases pass over with the vapors of distillation. This process is called the distillation in an atmosphere of an indifferent gas.

Another important distillation is the so-called dry distillation, in which organic substances are decomposed into solid, fluid, and gaseous products by means of high temperatures and with the exclusion of air. As a rule these products, called empyreumatical, are formed simultaneously, but are separately collected and treated. An example of dry distillation, which is also called destructive distillation, as it is accompanied by chemical changes, is the distillation of coal for the manufacture of illuminating gas, ammonia-water (in the raw condition, tar-water, which contains cyanides and sulphocyanides in connection with ammonia), semi-fluid, viscous, oily, and very valuable products, as, for example, tar-oil, which is extensively used in the manufacture of aniline colors, antiseptica, and medicinal preparations, are obtained as by-products, while coke is the residue of the coal distillation.

Besides these above-mentioned industries, many others are also based on the distillatory process. Among these are the distillation of wood by which acetic acid, wood alcohol, and wood tar are obtained; the distillation of resins through which turpentine, resin-oils, colophony are obtained; the petroleum industry and many others.

A special branch of distillation is that in which a solid is vaporized and by condensation directly passes from the gaseous to the original solid usually in a crystalline form. This process is called sublimation, and is mostly used to purify volatile solids, as for example, sal-ammonia (chloride of ammonia), benzoic acid, camphor, and indigo. The most interesting part in sublimation is that the solid does not pass through a liquid state, but at once to the gaseous form. The reverse process also takes place in like manner, namely, the condensation from the gaseous state back to the solid condition.

ERNST HANTKE,
Industrial Chemical Institute of Milwaukee.

Distilled Liquors, all the liquids obtained by distillation. It is often customary to consider, in contradistinction to the fermented liquors, wine, beer, cider, vinegar, only those distilled alcoholic liquids which contain about 30 to 50 per cent alcohol by volume (60 to 100 proof), and are consumed as alcoholic beverages or distilled liquors (whiskey, brandy, cognac, rum, arrack, gin, etc.). All the other more highly concentrated alcoholic liquids used in technics, medicine, pharmacy, etc., are called alcoholic spirits. In the distilled liquor beverage, alcohol is always the main ingredient, and the varying aroma and taste, due to the origin and the method of procedure, influence its commercial value. On the other hand, spirits are judged according to their concentration, so that secondary ingredients and aromatic substances deteriorate their value. Hence in the manufacture of spirits everything that is not alcohol is eliminated.

In the United States the concentration of alcohol is determined according to proof-degrees. The regulations of the United States Internal Revenue Office say that "proof spirit shall be held to be that alcoholic liquor which contains one half its volume of alcohol of a specific gravity of 0.7939 at 60° F." Therefore each proof-degree is equivalent to 0.5 volume per cent.

If 100 gallons of liquor contain 48 gallons of absolute, pure alcohol, it is 2 x 48 or 96 proof, and a spirit containing 92 gallons of alcohol per 100 gallons, is one with 92 x 2 or 184 proof. The revenue standard is a liquor with 50 volume per cent (100 proof) of alcohol. "Over" and "under" proof are not officially recognized in the United States, although we find these distinctions given in older books.

The raw materials used in the preparation of alcoholic liquors and spirits are:

1. *Alcoholic liquids*, as wine and its waste and by-products (wine-yeast, grape-cakes), the waste and by-products of the brewing industry, in which the spirit is obtained solely by distillation. The product of the wine distillation is used almost exclusively for cognac and brandy, which are especially manufactured in California and Ohio.

2. *Sugary substances*, as the extracts of the sugar-beet, sugarcane, mainly molasses, and also of sweet fruits (cherries, plums, sweet potato, Jerusalem artichoke, melons, etc.). The sugar must be converted into alcohol prior to distillation.

3. *Starchy substances*, among which we can enumerate the various cereals (barley, barley-malt, corn, rye, wheat, oats, rice, buckwheat, etc.), and also potatoes. Corn, barley, barley-malt, rye, oats, and wheat are mostly used in the United States. Before the alcohol can be obtained, the starch must be transformed into fermentable sugar, which in turn is fermented, previous to distillation.

4. *Fibrous substances*, in which the cellulose is converted into fermentable sugar. The further treatment is the same as above (No. 3). Concentrated mineral acids acting under pressure on cellulose, will cause the formation of fermentable sugar, and since such fibrous substances (peat, sawdust, etc.) are inexpensive, many experiments have been made to obtain a practical method for producing alcohol from such materials. Many such methods have been patented. During the International Chemists' Congress at Berlin, 2–8 June 1903, Simonson, from Christiania, Norway, reported on a process of manufacturing spirit from sawdust and also presented a calculation of the prospective profits, which, however, still lacks the confirmation of actual trial. The manufacture of alcohol from fibre stuff is as yet of theoretical interest, and is therefore merely mentioned here. Likewise is the preparation of

5. *Mineral spirit* of theoretical interest, although it can be prepared in the chemical laboratory. If ethylene (C_2H_4) is conducted into sulphuric acid, ethylsulphuric acid ($C_2H_5HSO_4$) is formed, which if diluted with water will split up into sulphuric acid and alcohol. Ethylene is a gas and is an ingredient of illuminating gas made from coal. It is also easily produced from acetylene (C_2H_2) by nascent hydrogen, according to the formula $C_2H_2 + H_2 = C_2H_4$. Acetylene is cheap, and is most readily obtained by the action of water upon calcium carbide (CaC_2). It is extensively manufactured and copiously used, but undoubtedly these experiments will be perfected in the future.

In accordance with the importance of these various kinds of raw material consumed in the large United States distilleries, we will first

of all discuss the manufactures of liquors and spirits from starchy substances.

These raw materials are treated, as in the brewing industry, with malt (mostly barley malt, sometimes also rye and wheat malt) in such a way that the diastase of the malt converts the starch into dextrin and sugar. But a distiller's malt differs in its properties from a brewer's malt. While the latter must impart its aroma and taste to the beer and only exert its diastatic power in a moderate degree, the former must be characterized by a maximum of diastatic power. Consequently the distiller prefers a malt from a small-kerneled barley, which has been kilned at low temperatures. The diastatic power is weakened by high temperatures. Consequently some distillers, who operate a malting plant in connection with their distillery, use only green malt, or at most, air-dried malt. The German distillers universally use green malt. In contradistinction to the brewer, the distiller prefers a malt made from a barley rich in nitrogenous matter, as this latter furnishes material for the formation of diastase and for the nourishment of the yeast. It is entirely wrong to suppose that a good brewer's malt is also a good malt for distillers. In mashing, the largest possible amount of starch must be converted into fermentable sugar (maltose) in order to obtain as high a yield of alcohol in the distillation as possible. Under the most favorable conditions 96 per cent of the starch in the mash material can be converted into maltose (the remaining 4 per cent are changed into dextrin), while in practice only about 80 to 81 per cent maltose are obtained, and the remainder is dextrin. After the maltose is decomposed into carbonic acid and alcohol, the dextrin is gradually converted by the diastase into maltose and then fermented. This can only be accomplished with vigorous yeast and proper treatment in the fermenting rooms. On account of this "after-effect" the diastase must be carefully guarded, especially by avoiding high mashing-off temperatures, and the formation of lactic acid and particularly butyric acid, produced by certain bacteria at a temperature of 40 to 50° C. (104 to 122° F.).

The mashing process varies according to the kind of product desired, the capacity of equipment (large, or small, or very small, the latter requiring hand power for mashing in place of machinery), the amount and quality of the raw material, and, oftentimes, on the fancy of the customers. Inasmuch as whiskey is the main product of United States distilleries, we will discuss its preparation first of all.

The word "whiskey" is of Celtic origin, for it apparently is an abbreviation of the word "usquebaugh" or "uisgebeatha," which corresponds to the Latin *aqua vitæ* (water of life). According to historical research the word *aqua vitæ* is a corruption, because the original wording for distilled spirit was *aqua de vite* (water from the grape vine). In mediæval times the monks changed this latter form to the one now in general use.

Although the same word is used in America, Ireland, and Scotland, the product is very different. The Irish and Scotch distilleries use almost exclusively kilned malt (only rarely, other cereals), while the American distilleries have an entirely different equipment and also their own characteristic development.

For the manufacture of whiskey, especially corn and rye, sometimes also bran, wheat, and kilned malt (0 to 15 per cent) are used. The best-known brands are:

Bourbon whiskey, in the manufacture of which corn is the main ingredient. According to the quality of the Bourbon, the materials vary as follows:

Brand	Malt	Rye	Corn
	Per cent	Per cent	Per cent
Ordinary Bourbons	10	10	80
Medium Bourbons	12	18-22	66-70
Good Bourbons	15	35	50

Rye whiskey when manufactured as a first-class article is made from 10 to 15 per cent kilned malt, 70 per cent rye, and the remainder rye-malt. Some distilleries replace a part of the rye by oats or barley.

Half rye whiskey similarly made as the above, except that for one half of the rye, corn is substituted.

Malt whiskey, in which malt predominates.

Wheat whiskey and

Oat whiskey are made in the same way as rye and half rye whiskey, except that wheat or oats is used in place of rye.

We must remark here, that the above appellations are only correct for the distiller, and that in commerce similar names are given to so-called compound whiskeys. Under this term are meant those products which are obtained from pure whiskey, either by dilution with water and rectified spirits, or by a mixture of several kinds, or by still further blending and mixing. In some cases, other liquors, as, for example, cognac, or rum, or even essences, are added to the pure whiskeys. This compounding is done in accordance with the requirements of local trade, or the special tastes and desires of the customers. The character of the natural product is dependent upon the materials and the methods of mashing and distilling. It is interesting to note that the taste of the public varies as the years pass by. In the United States during the fiscal year 1892–3, 40,835,783 gallons of Bourbon whiskey and 16,702,336 gallons of rye whiskey were made, while in the fiscal year just closed, the production of Bourbon whiskey was only 20,336,250 gallons, while that of rye whiskey was 21,587,221 gallons.

According to the mashing method we distinguish a "sweet mash" and a "sour mash" whiskey. The latter is characterized by a delicate, slightly sour taste and a fine ethereal aroma.

Mashing for Whiskey.— The material is ground separately, weighed in hoppers, and placed under a revenue-lock. In the smaller distilleries the corn is cooked with hot water, and kept boiling by means of steam until the starch is gelatinized. In larger distilleries the corn is gelatinized in high pressure cookers, under a pressure of 60 to 80 pounds. In either case the cooked corn is cooled down to about 164 to 166° F. In the high pressure cookers this reduction in the temperature is accomplished by a vacuum pump. In the smaller plants, malt, rye, or other cereals are added to the corn mash cooled to 164 to 166° F., so that the entire mash has a temperature of about 156 to 160° F. In the larger distilleries the specially prepared rye or malt mash is drawn into the

cooker by means of a vacuum pump. Here it is thoroughly mixed so that the final temperature is about 154 to 156° F. In order to obtain complete saccharification, mashing is done at this temperature for about 20 minutes, then the mash together with the grains are run into a collecting tub, from which it is pumped through a cooling system into the fermenters. The cooling system usually consists of a worm of a half inch copper pipe, which is encased in an iron water pipe. The mash flows through the copper pipe in one direction, while the current of water flows around the pipe in the opposite direction. It is always desirable to cool the mash to 64° F., but on account of the higher temperature of the cooling water, it is usually possible to cool the mash only to 66 to 68° F. At any rate its temperature should never be above 70° F. The concentration of the mash varies proportionately with the amount of material, and is usually about 18 to 25 per cent (seldom more), according to Balling.

While the mash is pumped into the fermenters, as much water or slop of the same temperature as the mash is added to the latter until its concentration is about 11 to 13 per cent, according to Balling.

The above-described method is used for sweet mash whiskey, while for sour mash slop is always used for mashing in place of water. The slop has not only acquired a definite acidity through the fermentation process, and certain peculiar and flavoring substances from the yeast, but also has obtained certain conversion products, formed by heating the grains in the distiller. Hence by the use of this slop, the whiskey receives those characteristics which have made it popular. In smaller distilleries, oak vats, so-called bushel tubs are used, into which boiling slop is poured, and corn in grits-form is doughed in under constant agitation with the hand (hence the name, hand-made sour mash). The malt and rye are added at 165° F. In medium-sized plants a large quantity of corn is doughed in in a similar manner in special mash tuns, and after the mash becomes somewhat thinner, due to the saccharification, it is pumped into hopper-like copper vessels. After the mashing off, the mash remains in the bushel tubs of the smaller distillery or in the vats of the larger plants for 20 to 24 hours for acidification. After this time, the mash is still of a somewhat solid consistency, so that it is separated in drums by means of a disintegrator. After cooling to the pitching temperature (64 to 68° F.), the mash is diluted with slop, to about 17 to 19 per cent, according to Balling. In some distilleries the concentration is lower.

The mashing process is different in very large distilleries, which have commodious mechanical appliances, and are prepared to mash vast amounts of material. It is customary to bring the corn mashed with water, to the boiling point by means of steam, and then to heat the corn to 300 to 310° F. (60 to 80 pounds pressure). The corn is kept at this temperature for 10 minutes in order to gelatinize the starch. The surplus steam is blown off, and the corn mash is cooled to about 164° F. At the same time, malt, rye, oats, or barley is mashed in with water in a special mash tank, which is supplied with a simple agitator and a double copper attemperator coil. After both mashes are united, the temperature is about 140 to 142° F., which is the temperature at which the largest possible amount of sugar is formed.

This mashing method is used in the large factories both for the manufacture of whiskeys, high wines, and spirits. The various brands of whiskey are then made by the use of different materials in varying properties. These large distilleries also use slop in place of water when making a sour mash whiskey. In order to obtain a higher degree of acidification, more lactic acid is allowed to form in the malt mash. In comparing the large distilleries with the smaller ones, we find that while the latter can pay more attention to the characteristic properties of the whiskeys, especially sour mash and fancy goods, the former does its practical work more technically and also obtains much higher yields. The manufacture of concentrated alcoholic spirits is only profitable when all the modern mechanical appliances are at hand, so that, owing to the constant decrease in the price of alcoholic spirits, the number of smaller plants is becoming less.

Fermentation of the Mash.— The sugary mash is fermented in the fermenters by means of yeast. In England, common ale yeast is usually added; in France and Belgium either top-fermenting or compressed yeast, which is also used by bakers, is generally added. In the scientifically operated German distilleries, the inventions and discoveries of modern times are successfully used, as for instance, a pure yeast culture of a distiller's yeast is made according to Hansen's method, just as a pure beer yeast is cultivated in many United States breweries according to the same method. (For a description of this process see under BREWING and YEAST and YEAST CULTURE.) In the United States distilleries a yeast obtained by spontaneous fermentation is generally used. Here Delbrueck's teachings in regard to natural pure culture are of importance. Experience teaches that when several yeast species are present, a certain one can be developed under certain conditions of nourishment, because a mash of definite concentration and proportion of fermentable to non-fermentable substances, made from definite materials, consequently containing definite percentages of albuminous and mineral substances, will vigorously develop at a definite temperature and acidity only one species of yeast and will suppress the rest. By maintaining the same conditions on a larger scale, that is, by using a greater amount of mash, the yeast thus developed can be further propagated. But in spite of the utmost care, natural pure culture is oftentimes defective, because the standard requirements are not rigorously observed. It may also happen that among the air yeasts which are developed for spontaneous fermentation, there is no species which will flourish under these requirements. Consequently, it would be advisable also to introduce in this country pure cultures, made from one individual cell, according to Hansen's method. Then the distiller would not be dependent on chance; and, of course, a pure yeast developed according to Hansen's method, would have to be cared for according to the principles of natural pure culture, as, otherwise, an infection with undesirable yeasts, mycoderma or fission fungi would gradually destroy the pure yeast.

In the United States distilleries the yeast is developed as follows:

A clear malt mash is made from ground

malt and pure water, generally condensed water. The water is boiled with hops, 1 oz. of hops per gallon of water, cooled to 170° F. and added to the ground malt, whereupon saccharification will take place. As soon as the conversion is completed, a clear mash is drawn either by filtration or extraction, which is then concentrated to 18 to 30 per cent according to Balling and cooled to 70° to 72° F. Air is forced into the mash in small copper vessels, so that after 24 to 48 hours the yeasts of the air will cause fermentation. This mash in the copper jugs is the so-called stock-yeast and is cultivated as needed. In case the yeast thus obtained is not satisfactory, the process is repeated. Most distillers constantly have a supply of this jug-yeast on hand and regenerate it by adding a portion of it to the above described, hopped, clear malt mash. This original yeast is poured into sterilized copper jugs and stored in an ice box or other suitably cool place.

This yeast is propagated for use in this way: Rye and malt are saccharified in water of 148 to 150° F. Acidification takes place during 24 hours, during which a temperature of 150° F. is maintained by means of a copper coil attemperator. After this period cold water is run through the attemperator, and the mash, having 18 to 20 per cent (Balling), is cooled to 66° F. and pitched with jug-yeast. After 12 hours this mash has sufficiently fermented, so that it can be used in pitching the large mashes.

The pitching temperature of the principal whiskey or spirit mash is usually 60 to 68° F. and in many cases of defective cooling is somewhat higher. The yeast mash is allowed to run to the main mash. The fermentation usually commences rapidly and shows an increase in temperature. After 24 hours the fermentation is most vigorous. The duration of fermentation is sometimes only 48 hours, for spirits and sweet mash whiskeys it is 72 hours, while for sour mash whiskey it requires 76 hours.

Sometimes abnormal conditions arise, among which is the so-called "foaming fermentation" that is an exceptionally stormy fermentation, in which losses of alcohol occur, due to the flowing over of the mash over the edge or rim of the fermenter. This is a result of various defects, and is either partly due to the materials, or the yeast, or may be occasioned by irregularities in the operation, or even by other causes. It would lead too far to enumerate them here, but much has been written on this subject by experts.

The fermented mash, called the sour mash, is now pumped into the distilling apparatus, where it is distilled as is fully described in the article DISTILLATION. It is customary to distil the whiskeys to 102–105 proof and spirits to 188–190 proof. In small distilleries an ordinary pot-still is used for whiskeys and a liquor of about 70 proof is obtained, which is concentrated to 101-102 proof in a doubler. A doubler consists of a copper cylinder having a wide outlet pipe, from which the vapors enter the condenser. In the small distilleries, the heating is accomplished by direct firing, by which a peculiar, characteristic taste, which is appreciated by the consumers, is engendered. Such whiskey is called "Fire Copper Bourbon Whiskey."

When oats, barley, or wheat are used in the manufacture of certain whiskeys, they are worked up in the same manner as rye in the above-described mash.

Potatoes are not mashed in the United States, although they are commonly used in Germany. They contain only 18 to 20 per cent of starch, while the cereals contain 60 and more per cent of starch. Instead of mashing the ground, rasped or chipped potatoes in open mash-tubs, as was formerly done and is even done to-day in small plants, they are now first steamed under a pressure of 2 to 3 atmospheres, whereby the starch is put in condition to be easily acted upon by the diastase. After the steaming the potato mass is cooled to 55 to 60° C. (131 to 140° F.), which is the best saccharification temperature. Then this mass is mixed with malt, generally green malt, either in the cooker or in the mash-tub, and saccharified. It is customary in Germany to make a thick mash of 22 per cent (Balling), sometimes even of 26 to 28 per cent. The fermentation is accomplished by the addition of a cultivated pure culture yeast. The distilling process is similar to our method. In Germany less brandy but more highly concentrated alcohol for industrial purposes is made.

A special liquor obtained from starchy substances is arrack, which is made in the East Indies, partly from rice and partly from the juice of the cocoa-trees, called toddy, from which "Arrack de Goa" is distilled. The rice is germinated and treated about the same as barley malt. Good arrack is said to be made from 30 to 35 per cent rice, 3 to 5 per cent toddy, 60 to 65 per cent molasses from the sugarcane.

In all those cases, in which a mealy substance is utilized, the thin slop remains after the distillation, which contains all the ingredients of the corn and yeast mash. Besides the skins and husks, we find albumen, unfermented sugar, lactic acid, acetic acid, glycerine, mineral substances, etc. This wet slop was mainly used as feed for cattle, so that formerly every distiller also had a herd of cattle. It is claimed that an animal's health will suffer if slops are copiously fed, so that on this account, and especially in order to dispense with some of the labor caused by the maintenance of the cattle, the slop was dried. By thorough drying, which can be done immediately after the distillation, spoiling is prevented and a constantly durable and valuable article of commerce, which need never be given away below its full value, is obtained. The drying of slop is accomplished in several operations: (1) Settling of the insoluble substances; (2) Pressing out; (3) Drying in cylindrical driers.

There are also some apparatus in which the slop is concentrated by means of steam, pressed and finally dried.

The feeding value of wet and dry slop can readily be seen from these analytical data, ob-

ANALYSIS OF THE SLOP.

Condition	Water	Proteids	Nitrogen-free carbohydrates	Fat	Cellulose	Ash
	Per cent	Per cent	Per cent	Per cent	Per cent	Per cent
Wet	91.2	2.34	3.63	1.22	0.88	0.74
Dry	11.94	23.43	36.35	12.22	8.78	7.28

tained by the Industrial Chemical Institute of Milwaukee in an analysis of slop in either condition. The mash material was composed of 80 per cent corn, 10 per cent rye, and 10 per cent malt.

Preparation of Alcohol from Koji, according to Takamine's patent.— This process, which is used in Japan in the manufacture of saké, was changed for other cereals by Takamine, a Japanese, and was introduced by him in 1893-4 in the Manhattan Distillery in Peoria, Ill. But this process has not been extensively used, so that now, after 10 years, it is almost forgotten, although it aroused considerable interest at one time. In this process the spores of a certain fungus, as for instance aspergillus oryzæ are exposed in hothouse-like compartments to uniformly moist air of 77° F. on steamed, coarse wheat bran. The spores rapidly develop to an exuberant white mold whose mycelium forms numerous spore-bearing threads which grow into the nutrient medium. A considerable portion of the nutrient medium is consumed and a decided rise in temperature is noticeable. According to the temperature, the formation of mold is finished in about 36 to 48 hours, whereupon the mass with the fungi is mixed with an equal amount of wheat bran and extracted in water, whereby the Koji-extract is obtained. This is added at 140° F. to corn, cooked in the customary manner, whereupon complete conversion is effected as with diastase. The mash thus obtained, which has a concentration of about 15 per cent according to Balling, is fermented in four days by means of a fungus, called takamoto, propagated in a similar manner to the Koji fungus. It is claimed that the yield in this process is 11 to 12 per cent higher than in the process now in vogue, so that it is really surprising that this process is not adopted.

In the Belgian distilleries Effront's system is successfully used to prevent disturbances in the operation of the plant caused by infection. The main principle in this system is that the highly antiseptic hydrofluoric acid or mono- or bifluoride of ammonia is added to the mash, through which the formation of lactic acid becomes unnecessary; the work is also much more accurate. Yet this process has not yet been introduced in the United States.

The Control of the Distillery.— It is self-evident that the control in the distillery is of prime importance in a rationally operated plant, for which reason also, the large distilleries which have well-equipped laboratories, work advantageously, while on the other hand, the small distillers constantly suffer large losses. The control is properly carried out when regular analyses are made of the raw materials of the supplementary articles, namely the yeast, the mash before and after fermentation, the slop, the water and also the air in the mashing and fermentation cellar. (The Kentucky distilleries use a pure, hard water, rich in lime.) It happens in too many cases that the control is not properly carried out, which is, of course, a loss to the distiller, although at present the small distiller is enabled to have the control carried out by a special laboratory (Industrial Chemical Institute of Milwaukee). When the control is properly exercised, the yield will be increased. Inasmuch as theoretically one pound of starch produces 0.5678 lb. of alcohol, then, according to Hantke, the highest possible yield of a distiller's bushel (which is always figured at 56 lbs. whether the material actually weighs that much or not) with

60 per cent starch in the material will be 5.76 gal. Proof alcohol.
61 per cent starch in the material will be 5.86 gal. Proof alcohol.
62 per cent starch in the material will be 5.95 gal. Proof alcohol.
63 per cent starch in the material will be 6.05 gal. Proof alcohol.

But actually the following yields are obtained from one bushel of grain (56 lbs.):

90 per cent corn + 10 per cent malt, about 4.7 gal. Proof, seldom 4.9 gal. Proof.
55 per cent corn + 35 per cent rye + 10 per cent malt, about 4.25 gal. Proof.
65 per cent rye + 15 per cent malt + 20 per cent of rye malt or oats, or barley — about 4.0 gal. Proof.

Among the sugary materials used in distilling, the molasses, both of the beet and cane sugar refinery, is used, and the production of liquor from molasses is continually increasing. Molasses contains about 70 to 80 per cent extract, of which about 50 per cent is sugar. On account of its concentration the molasses must be diluted and because of its alkalinity it must be neutralized. Hydrochloric acid is generally used for the neutralization. Molasses thus prepared is pitched with yeast and fermented just like a sweet mash, but in many cases it is difficult to ferment the molasses, probably because of the presence of butyric and other fatty acids, which are largely present and are known to retard and stop fermentation. Also very abnormal and undesirable fermentation phenomena, as, for instance, saltpetre fermentation, can be traced to the characteristic properties of the molasses. Lately a liquor is obtained from molasses in the United States which acquires a definite aroma and taste, according to character of yeast mash, so that it resembles certain standard brands, such as Bourbon, etc.

In the West Indies, especially in Jamaica, the molasses of the sugarcane, which is merely extracted to obtain the sugar, so that the molasses contains no admixtures as it does in our sugar refineries, is fermented and distilled. This product is called rum, in which the peculiar aroma is due to butyric ether. An inferior grade of rum is made from the sugar scum. Many brands of rum acquire their bouquet through the addition of clover leaves, Botany-bark, etc. Artificial rum, made by mixing spirit with rum essence and adding a little coloring matter, can readily be distinguished from genuine rum.

Sweet fruits, the juice of which is rich in sugar, also serve as raw materials for the spirit industry. The so-called Kirschwasser is obtained from cherries. Besides the juice, the extract also contains components of the cherry stones, which are crushed and added to the liquid.

Sliwowitz is obtained from prunes, and in like manner a liquor is obtained from peaches (peach brandy). In the East Indies a liquor is distilled from the fermented juice of the date palm, while in the West Indies the same is done with the fermented juice of the plantain. Pineapples, oranges, apricots and other fruits can also be made to furnish a liquor.

An important industry in the United States as well as elsewhere is the production of brandy in its purest form called cognac. It is the direct

product of the wine distillation. Its quality depends entirely upon the quality of the raw materials. The distillates of the wine distillation are characterized by being free from fusel oil. The aroma is due to œnanthic ether, which is also prepared artificially and is used in imitation cognacs. Cognac receives its brown color from being stored in oak casks.

The by-products of the wine distillation are also utilized, but, of course, furnish an inferior article. A fairly pure brandy can be made from the grape cakes, while the wine yeast furnishes a spirit of a very medium quality.

Gin, kummel, peppermint, etc., are common grain spirit distilled and flavored with juniper berries, caraway, peppermint, etc., mostly when the low wines are doubled. Above the pot-still there is a bell-shaped vessel, containing the flavoring material, and the vapors leaving the still pass over this flavoring material before they enter the dephlegmator or doubler.

The innumerable class of various sweet liqueurs, cordials, and ratafias are mostly only mixtures of good, almost fusel-free spirit with syrup and an aromatic substance, which produces the flavor. Most of them are obtained by steeping fruit or aromatic herbs in pure spirit and submitting the liquid to distillation. They are then colored and sweetened with sugar. The best known are absinthe, anisette, curaçoa, benedectine, boonecamp, crême de menthe, anise, and others.

Recipes for their preparation will be found in special works.

ERNST HANTKE,
Industrial Chemical Institute of Milwaukee.

Distilled Water. See DISTILLATION.

Distilling Industry. There can be no question but that alcohol is one of the most important substances produced by the art of man, for, outside of the extraordinary consumption of alcoholic liquors, it is more extensively applied, and to a greater number of purposes than almost any other manufactured liquid. In spite of the great demand, however, there is but one source from which alcohol can be obtained. It is produced from the fermentation of sugar or other saccharine matter that has been obtained from plants which contain either free sugar, or a starch convertible into sugar, and can be procured in no other way. Commercially, when such alcohol is made from grain, it is called grain-alcohol; when it is made from reindeer and Iceland moss, it is called moss-alcohol; when made from potatoes, or beets, root-alcohol, and, if from grapes, wine-alcohol.

Although the first historic mention of alcoholic liquors dates from the 11th century the art of distillation was known for centuries prior to that time. The Chinese had practiced it for hundreds of years before it was introduced into Europe, and tradition attributes its discovery to the Arabian alchemists. This art of distillation consists in the process of converting liquid into vapor in a closed vessel by the application of heat and reconverting it into liquid by conveying the vapor into a cooler vessel; thus, while spirits are not actually produced by distillation as much as by the prior act of fermentation, the distilling process separates the spirits from the mixture in which they have previously existed. Brandy, one of the first distilled liquors, was originally known as the "water of life," and one of the early alchemists was so enthusiastic over the discovery of this liquid that he declared that "this admirable essence is an emanation from the Divinity; an element newly revealed to man, but hid from antiquity because the human race was then too young to need this beverage, destined to revive the energies of modern decrepitude."

While brandy and several other distilled liquors had previously been made, the first product of the distillery to reach the dignity of a commercial position was called "rectified whiskey." This was a crude high-wine which had been prepared for sale by being passed through a layer of charcoal, a process which tended to extract the fusel oil. Later, this product was made more saleable by the addition of flavoring extracts, and by being put into heavily charred barrels, with a little sugar coloring to eradicate some of the rankness and fieriness that distinguished most of such liquors. This method of manufacture was followed until the process of redistilling was invented, when an apparatus was provided by means of which the fusel oil could be more thoroughly extracted from the spirits than had ever before been possible, while, to make the liquor more palatable, a certain proportion of old-fashioned Bourbon from Kentucky, or rye from Maryland, or Pennsylvania, was added to give the bouquet, flavor, and appearance of genuine whiskey. In fact, the sale of the goods known as "redistilled whiskey" became so general that the proportion as compared to the quantity of genuine Kentucky and other whiskeys sold was not less than 15 to 1.

Although the name "Bourbon whiskey" now has a wide significance, it was originally used to distinguish the particular kind of liquor that was distilled from Indian corn, or rye, in Bourbon county, Kentucky. At that time the yield of Bourbon whiskey was about in proportion to three gallons to the bushel, and it was so heavy in body and flavor that it was considered as of great value in the work of compounding, in spite of the fact that it required many years of maturing to neutralize the fusel, and other essential oils which it contained by the action of the atmosphere. Popular as this whiskey was from the days of its inception, its fame spread so rapidly that it was not long before other distilleries sprang into existence, in Kentucky and elsewhere, and as all of these manufacturers produced an imitation of "Bourbon," the best method of defining that liquor to-day is to say that it is a whiskey distilled from corn or rye, after the method which was originated in Bourbon county.

Great as the demand for this whiskey was, and, despite the fact that the trade was compelled to admit that such goods could not attain to full maturity, the only condition in which they were ready for consumption, within less than the specified three years, the improvements in the process of manufacture were slow. It was at about this time that some important changes were made in the science of mashing, and as these not only increased the yield, but lessened the cost of production, the Bourbon whiskeys, which had formerly been used so extensively for compounding purposes, began to attain wider popularity as a beverage. It was also quickly discovered that this increase in yield had not injured the quality of the whiskey,

but that, on the other hand, such goods were of finer grade, the proportion of fusel oil, the eradication of which required so much time, becoming less as the quantity of whiskey increased.

The whiskey upon which the reputation of Kentucky so largely depends is that kind of liquor that is known as sour-mash, but, unfortunately for the commercial integrity of the distillers, it must be admitted that there are comparatively few establishments that are so careful as to the preservation of their reputations that they will distil nothing but genuine sour-mash goods. At the present time the consumption of whiskeys of all grades made in Kentucky is estimated as being in excess of 25,000,000 gallons per annum, while the principal States in which ordinary spirits are produced are Illinois, Ohio, and Indiana.

Owing to its greater availability and cheapness, grain is the material which is most generally used in the distillation of liquors. Fruits, which are very good for this purpose when they can be obtained, are not only of a perishable nature, but they are not available during the greater portion of the year; thus, while apples, peaches, and grapes are used in the manufacture of distilled liquors in California, New Jersey, and Ohio, the output is necessarily limited. In the case of fruit brandys, the State of California manufactures a great deal more than half the total product of the country.

Rum, which was once one of the most popular of liquors, is now very little used in this country, being mainly manufactured for export purposes. Made of molasses as the chief material, its distillation is confined almost exclusively to New England, where its production is constantly decreasing, owing partly to the fact that grain-alcohols are cheaper to manufacture, and partly to the steadily increasing popularity of whiskey as a beverage. During the past few years several attempts have been made to distill pure spirits from molasses, but none of these experiments have been entirely successful, owing to the difficulty of eliminating the odor, which is always suggestive of rum. In the making of pure spirits, no aging is required. Such products of the still are ready for manufacturing purposes, or for compounding, the day they are produced, for, no matter how long they are kept, they cannot be improved. It is such a product that is doctored up by the use of coloring and flavoring to the appearance of genuineness in which it is possible to dispose of it as "genuine" whiskey, and some are even made to produce a fairly passable imitation of the real sour-mash.

In reviewing the products of the American distilleries it is necessary to give a little more than passing attention to the use of distilled spirits in the arts, manufactures, and medicines of this country. Among these alcohol and cologne spirits are the most important, although such products as high-wines, whiskey, brandy, gin, and rum, are also used for these purposes. Pure alcohol is a substance that cannot be obtained by the process of distillation alone. The alcohol, or rectified spirits of the pharmacopœias contain, in the United States, 9 per cent by weight of water, and, in Great Britain, 16 per cent; while the proof-spirits, or diluted alcohol, has 54½ per cent by weight of water in the United States, and 51 per cent in Great Britain. In spite of its general undesirability, there can be no doubt but that great quantities of alcohol are used as a beverage, and while it is impossible to collect anything like reliable data upon this subject, it has been estimated that no less than 15 barrels of alcohol are thus consumed in New York city alone every day of the year, and that fully one half of the alcohol which finds its way to the Northwest is used as a beverage by the Poles, Norwegians, Swedes, Hungarians, Finns, and Russians, who abound in that part of the country. It is also a well-established fact that the foreigners who are employed in the coal mines of Pennsylvania are great consumers of alcohol.

In the making of pharmaceutical preparations a large proportion of the cost is due to the use of distilled spirits in their composition. In many cases in which alcohol would be unsuitable, cologne spirits are used, while such liquors as whiskey, brandy, rum, and gin, furnish the basis upon which many proprietary medicines, tinctures, and medicinal wines depend, not only for their preservative qualities, but for their effect upon the human system. In fact, it has been estimated that no less than 15 per cent of all the distilled spirits consumed in the United States, are used in the arts, the manufactures, and in the making of medicines.

The entire production of distilled spirits in the United States for the year 1904 was 139,505,214 gallons, of which 20,274,089 gallons were bourbon whiskey, 18,371,343 gallons rye whiskey, 2,110,216 gallons gin, 1,801,179 gallons rum, 5,193,262 gallons fruit brandy, including apple, peach, and grape, 11,846,082 gallons alcohol, and the balance, 57,997,506 gallons, pure neutral spirits. The total consumption in the United States of domestic distilled spirits during the year 1904 amounted to 118,446,281 gallons, while the consumption of imported distilled liquors in that year was 2,655,716 gallons. The exports of distilled spirits for the year 1904–05 amounted to 3,514,529 gallons, the value of which was in excess of $2,500,000. The average quantity of grain used by the distillers of spirits during the past 10 years has exceeded 22,000,000 bushels, more than half of which has been corn, while the use of this grain has been the means of suggesting a collateral industry which has now become a factor of considerable importance, that of fattening cattle and hogs on the slops from the distillery.

In addition to the enormous production of liquors of which we have record, however, there is no doubt but that there are a large number of illicit stills throughout the country that are annually producing a great amount of distilled spirits that succeed in evading the government's tax. These illicit distilleries, which owe their existence to the inherent repugnance of a certain class of grain growers to pay the heavy tax which the government imposes upon the maker of distilled liquors, abound throughout the mountainous regions of the country, more especially, perhaps, in the Southern States. In such sections these small distillers make and sell their product, irrespective of any claim that the government may have in the matter, and as a large proportion of the liquors that are made are consumed in the same neighborhood, it is next to impossible to obtain any record of them.

Although it is true that the government has succeeded in making the distilling industry one of the most trustworthy sources of national in-

cure by the imposition of heavy taxes upon its production, those who are financially interested in the manufacture of liquors are advocating several reforms in legislation, all of which, they believe, will tend to aid the producer in furnishing a wholesome, and thoroughly matured beverage at a minimum cost. They hold that the present legislation fails in its primary object — the promotion of the public health and welfare — by enforcing a tax that is so high that its collection naturally tends to bring none but inferior grades of goods within reach of the masses, for the simple and very natural reason that the manufacturer, in order to meet the demands of so great an impost, will sometimes be almost compelled to consent to lower the standard of his goods, that he may save in quality the amount which he must pay in meeting the expenses of the tax. It is held that this factor is one of the direct reasons for the production of cheap imitation liquors, which are not only made out of common spirits to be sold practically the same day that they are made, whereas the honest maker of genuine whiskeys must hold his goods for several years while they are attaining that maturity that will enable him to place them on the market.

The history of the various combinations in which the American distillers have participated during the past 15 years is too long and too complicated a story to be told in so brief a space. Combinations have been formed and have failed, only to be superseded by others, none of which were without some influence in the progress and development of this great American industry. See BREWING AND MALTING; BREWING INDUSTRY; DISTILLATION, ETC.

Distinguished Service Order, an order instituted by Queen Victoria 6 Sept. 1886 for the purpose of rewarding the naval and military officers mentioned in despatches for their distinguished service. Foreign officers who have been associated with British forces in naval and military operations are eligible as honorary members, and the order ranks next to the order of the Indian empire. The original badge was a gold cross, enameled white, edged gold, with the imperial crown on one side and the cipher V.R.I. on the other, each enclosed in a laurel wreath.

Disto'ma, a trematode, or fluke worm, which is a form of parasite frequently present in cattle and occasionally, in the form of the *Distoma hepaticum*, affecting man. At least eight or nine different species of distoma are known. The commonest ones, however, are the liver flukes of sheep and cattle. The *D. hepaticum*, or the large liver fluke, and the *D. lanceolatum* are the commonest forms. In sheep, the worm gives rise to the disease known as "rot," which is frequently fatal. In man, the affection known as distomiasis results when the gall-bladder and liver passages become infected. The liver is usually enlarged, there is very frequently hepatic pain, jaundice, diarrhœa, vomiting, and ascites. Infection takes place largely through eating plants in which the egg or embryo are found. The domestic cat has a distoma, and in India, Japan, China, and Egypt other forms of fluke are known. A *D. hæmotobium*, or *Bilharzia*, is a special form that generally attacks the organs of the genito-urinary system and although rare, it is becoming sufficiently common in this country, as a result of intercourse with the inhabitants of our Oriental possessions, to cause a certain amount of apprehension that its distribution may become more general.

Disto'mea. See TREMATODA.

Distress, or Distrain (from the Latin *distringo*, to bind fast), is the taking of a personal chattel of a wrong-doer or a tenant, in order to obtain satisfaction for the wrong done, or for rent, taxes, or service due. The thing taken is also called a distress.

Distribution, in political economy, the apportioning of the products of industry among the people concerned. The methods of distribution have varied and do vary in accordance with the state of social development. They depend on legal as well as on economic conditions. They depend mainly on the ideas and institutions which prevail with reference to property in the three requisites of production — namely, land, labor, and capital. In countries where slavery prevailed, the slaveholder, as the owner alike of land, labor, and capital, disposed at his pleasure of the entire product of industry. Under the feudal system, the cultivator who was attached to the soil and had a fixed interest in it, was to render to his superiors dues in labor, in kind, and latterly in money, which were fixed by custom or authority. Where the system prevails of cultivators owning the soil, as in America, and among the peasant proprietors of the European continent, the owner, inasmuch as he unites in his own person land, labor, and capital, disposes of the entire product, except such portion as may be claimed by the money-lender. In cases where the state owns the land, the cultivator pays a rent or tax to the government, and retains the remainder. The *metayer* system still exists in Italy, the owner advancing the land and stock (in whole or in part), and receiving from the cultivator a fixed share of the produce, generally one half.

In Great Britain, and to a large extent in other countries with a highly developed industry, land, labor, and capital are supplied respectively by three different classes of persons, and their share in the produce is determined by free competition. The classical political economy of England may be defined as a description and analysis of such an economic condition of society. It claims to be a science only in so far as the competitive system prevails. The landlord's share in the produce thus determined is called rent; that of the capitalist and employer is designated as interest, profit, earnings of management, etc.; the laborer's share is wages. It should be pointed out that under such a system, the central function in distribution, as well as in production, rests with the employer. As he originates and controls the productive process, so in the distributive process he settles with landlord and laborer, and then disposes of the produce. If the employer operates in whole or in part with borrowed capital, interest on that capital must also be deducted from his share of the produce. All these claims satisfied, the amount of his share will depend on his success in disposing of the product.

Whatever the arrangements regarding property and the distribution of the fruits of industry may be, account must be taken of the share claimed by the government in the form of taxes, for the maintenance of the army and navy and

other means of defense, for justice and police, and for education, etc.

It is now admitted that economists have bestowed excessive attention on production, to the neglect of the problem of distribution. But the reproach has a much wider application than to economists merely, for it may generally be said that while modern communities have enormously increased their productive forces, they have not yet solved the problem of distribution. The enormous inequalities of distribution are a danger felt by all thinking men. It is a question which is more and more challenging the attention of statesmen and economists. An economic system can be satisfactory only when a high standard of production finds its complement in a reasonable and equitable distribution, supplying to the mass of the citizens the means for their due physical, intellectual, and moral development. For a special method of seeking to secure the equitable distribution of profits among those who earn them, see CO-OPERATION.

Distribution of Animals. See ZOÖGEOGRAPHY.

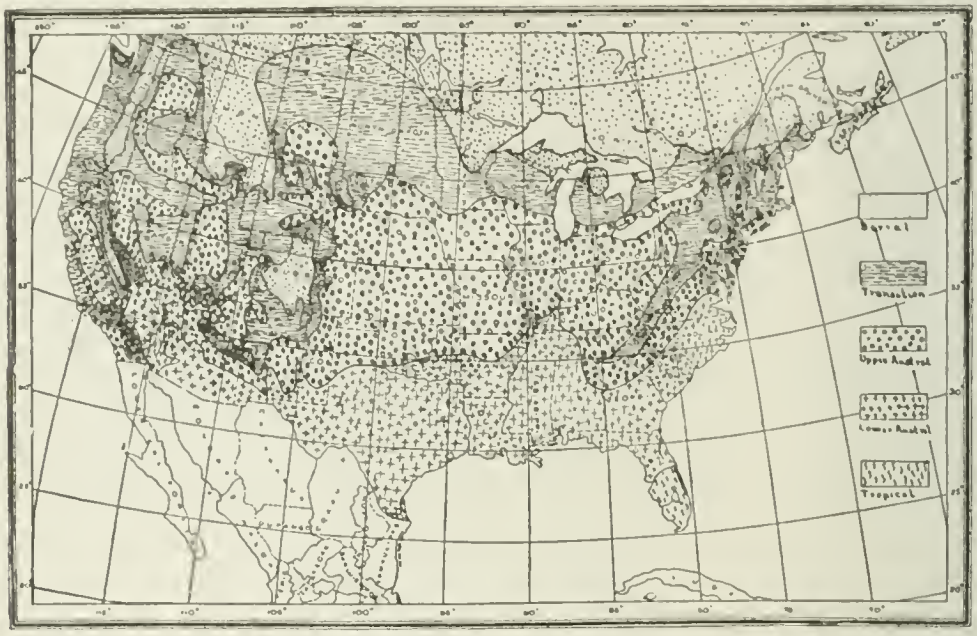
Distribution of Animals in North America. Knowledge upon this subject is deemed of such importance to the public that for several years the Department of Agriculture at Washington has been making scientific investigations, and publishing full reports of its observations and experiments.

When the boundaries of the life zones and areas are accurately mapped, the agriculturist, knowing the faunal area, and the beneficial or harmful animals, birds, and insects, can prepare in advance for the protection of crops. If no means have yet been found of exterminating an animal injurious to a certain crop, the first thing will be to ascertain the exact localities in when such animals exist, and those in which they do not. Mr. L. O. Howard, writing of the San José orange scale-insect, says: "It may prove to be a significant fact that, although nursery stock affected by this scale has for six or seven years back been sent to all the fruit-growing regions of the eastern States, according to our present information the scale has established itself only in regions contained within the so-called Austral life zone. Mapping the points of establishment, it is very interesting to see how accurately this distribution has been followed. This fact will relieve New England fruit-growers north of southern Connecticut; those inhabiting the greater portion of Pennsylvania, except in the southeastern one fifth and a western strip; those in New York, except for the strip up the Hudson River, and the loop which comes in from the northwest and includes the counties bordering Lake Ontario on the south, as well as those inhabiting the northern portion of the lower peninsula of Michigan and all of northern Wisconsin, from any fear of this insect. Such a condition of affairs would seem almost too good to be true, but the possibility of its truth is suggested by what we know up to the present time."

Agriculturists living within the area likely to be invaded by certain animals, large or small, can escape by planting crops not affected, while those living outside may largely increase their revenues by giving special attention to the cultivation of the crops that are affected in the adjacent life zone. A knowledge of the natural life areas and of their distinctive species and crops will enable farmers and fruit-growers to select the products best adapted to their localities, will help them in their battle with harmful species, and will thus put an end to the present indiscriminate experimentation by which hundreds of thousands, if not millions, of dollars are needlessly expended each year.

Previous to the beginning of the scientific work by the Department of Agriculture, the faunal areas east of the Mississippi valley had been recognized and in a general way defined, and attempts had been made to divide the country as a whole into areas of higher grade. Most zoological writers had agreed in apportioning the United States into three primary provinces or regions — an eastern, reaching from the Atlantic to the plains; a central, from the eastern edge of the plains to the Sierra Nevada and Cascade Range; and a western, or Pacific, from the latter to the Pacific Ocean. It soon became apparent, however, that in order to gain a clear conception of the facts and phenomena of distribution a careful study of the subject must be made in the field, where the actual range of mammals, birds, reptiles, and insects could be ascertained and the distinctive areas contrasted. With this object in view, and with the sanction and approval of the Hon. J. M. Rusk, secretary of agriculture, and the Hon. Edwin Willits, assistant secretary, an experimental biological survey was made in the summer of 1889. The area selected was the San Francisco Mountain region in Arizona, which, because of its isolation, altitude, southern position, and proximity to an arid desert, was believed to offer unusual facilities for a successful study of the problems involved. The area of which a careful survey was made comprises about 5,000 square miles, and enough additional territory was examined to make in all nearly 12,000 square miles. One result of this first survey was the complete overthrow of the main faunal areas previously recognized in the United States, and a radical change in the conception of the principles involved. In ascending the mountain a succession of climatic belts were traversed, similar to those encountered in journeying northward from the southern States to the polar sea, and each belt was found to be inhabited by a distinctive set of animals. The more important results of the survey may be briefly summarized as follows: (1) It was demonstrated that mammals, birds, reptiles, and insects are distributed by association of species; (2) that between the desert of the Little Colorado and the summit of San Francisco Mountain there are seven distinct zones or belts of animal life; and (3) on comparing the principal facts of distribution on this mountain with corresponding facts over the country at large, three important truths became apparent: (*a*) That the several life zones of the mountain could be correlated with corresponding zones long recognized in the eastern United States; (*b*) that these same zones are really of transcontinental extent, though never before recognized in the West; and (*c*) that the fauna of North America as a whole is properly divisible into but two primary life regions, a northern, or Boreal, and a southern, or Austral, both stretching across the continent from ocean to ocean.

The results of this experimental biological survey were so important and far-reaching as completely to revolutionize current notions of distribution. It was perceived that the Austral



as well as the Boreal elements in the fauna are distributed in transcontinental belts; hence the arbitrary and irrational division of the United States into Eastern, Central, and Western "provinces" gave way before a rational system, based on a knowledge of the actual facts of distribution, which were found to conform to the general principle of temperature control early recognized by Humboldt and others.

In 1890 a biological reconnaissance was made of south-central Idaho, the area covered comprising about 20,000 square miles. The zones recognized were the same as in the San Francisco Mountain survey, except that the lowermost was absent. In the report on this expedition the courses of the several zones were described and the characteristic species of animals enumerated. In 1891 the most comprehensive and thorough biological survey ever undertaken was made by the division. An area embracing 100,000 square miles, stretching from the Pacific coast to the 113th meridian and from lat. 34° to lat. 38°, was chosen as the field of operations. This area comprises the greater part of southern California and Nevada, southwestern Utah, and the northwestern corner of Arizona, thus including all of the torrid desert valleys and ranges between the Sierra Nevada and the Colorado Plateau. It embraces also the highest and lowest lands within the United States — from Death Valley, nearly 500 feet below the level of the sea, to the lofty snow-capped peaks of the high Sierra, culminating in Mount Whitney at an altitude of nearly 15,000 feet. The region was selected because of the exceptional advantages it offered for studying the distribution of animals in relation to the effects of temperature and humidity at different altitudes. The close proximity of desert valleys and lofty mountains brings near together species which in a more level country are characteristic of widely remote regions. Thus, in one place on the east side of the Sierra all of the life zones of North America, from the tableland of Mexico to the polar sea, may be crossed in a distance of only 10 miles.

This expedition, which came to be known as the Death Valley expedition, determined the distinctive species of each zone, traced the courses of the several zones from California to the Colorado Plateau, and made large collections of the mammals, birds, reptiles, and insects, which collections are now deposited in the United States National Museum. The zones were segregated into the two great transcontinental regions — Boreal and Austral (see map).

In 1892 the northern boundary of the lower Austral zone was traced from New Mexico eastward across Texas, Indian Territory, and Arkansas to the Mississippi River. In 1893 a study was made, in the interest of biology, of Wyoming, a large part of which State was found to be from 1,000 to 3,000 feet lower than represented on current maps, and consequently the climate is warmer than was supposed by those not residents of the State. The Wind River and Big Horn basins and the plains east of the Big Horn Mountains were found to be upper Austral. Work was done also on the Great Plains in Kansas, Nebraska, the Dakotas, Utah, and on the tableland of Mexico. During the year 1894 a study was made of the greater part of Montana, and the work was continued in South Dakota and in the plateau region of Arizona. In Arizona two sections were run from the plateau south to the lower Austral.

In the annual report of the Department of Agriculture for this division for 1893, the seven life zones of North America, including the tropical, were characterized with special reference to eastern North America. Beginning at the north, these zones may be described as follows:

Map showing life zones of the United States.

1. The Arctic or Arctic-Alpine zone lies above the limit of tree-growth, and is characterized by such animals as the snow-bunting, snowy owl, white ptarmigan, polar bear, arctic fox, and barren-ground caribou or reindeer.

2. The Hudsonian zone comprises the northern or higher parts of the great transcontinental coniferous forest, and is inhabited by the wolverene, woodland caribou, moose, great northern shrike, pine bullfinch, white-wing crossbill, white-crowned sparrow, and fox sparrow.

3. The Canadian zone comprises the southern or lower part of the great transcontinental coniferous forest. Among the characteristic mammals and birds are the porcupine, varying hare, red squirrel, white-throated sparrow, and yellow-rumped warbler.

4. The Transition zone is the belt in which Boreal and Austral elements overlap. It covers the greater part of New England, New York, Pennsylvania, Wisconsin, and southern Michigan, and pushes south along the Alleghanies to the extreme northern part of Georgia. Here are the southern mole and cottontail rabbit, the oriole, bluebird, catbird, thrasher, chewink, and wood-thrush, the hermit and Wilson's thrushes, solitary vireo, boblolink, red squirrel, jumping mouse, chipmunk, and starnosed mole.

5. The Carolinian zone covers the larger part of the Middle States except the mountains; on the Atlantic coast it reaches from near the mouth of Chesapeake Bay to southern Connecticut, and pushes still farther north in the valleys of the Hudson and Connecticut rivers. It is the region in which is found the gray fox, fox squirrel, cardinal bird, Carolina wren, tufted tit, gnat-catcher, and yellow-breasted chat.

6. The Austroriparian zone covers the greater part of the South Atlantic and Gulf States, beginning at the mouth of Chesapeake Bay. Here the mocking-bird, painted bunting, red-cockaded woodpecker, and chuck-will's-widow are characteristic birds, and the cotton-rats, rice-field rats, wood-rats, little spotted skunks, and free-tailed bats are common mammals.

7. The Tropical region within the United States is restricted to southern Florida, extreme southeast Texas (along the lower Rio Grande and Gulf coast), and the valley of the lower Colorado River in Arizona and California. Among the birds may be mentioned the white-crowned pigeon, zenaida dove, quail doves, a Bahaman vireo, a Bahaman honey-creeper, and caracara eagle.

Since the time of Humboldt, at least, the fact has been recognized that animals are not universally distributed over the earth, but disappear along more or less definite lines which prominently indicate changes in temperature uncongenial to certain species; but exactly what temperatures exert the controlling influence, and how they can be measured, have only recently been discovered. Until recently the mistake was made of assembling all the temperature data in accordance with a single hypothetical law. Then a radically different plan was tried: the temperature data were platted in accordance with two widely different principles — one with reference to the northern, the other to the southern, boundaries of the zones. This departure was suggested by a somewhat tardy recognition of the fundamental facts of the distribution discovered in 1889; namely, that animals are themselves distributed from two directions — Boreal species from the north, and Austral species from the south. It seemed reasonable to infer, therefore, that northward distribution should be governed by one set of temperatures, and southward distribution by another. When the sums of the positive temperatures for a large number of localities in the United States were platted on a large-scale map it was found that isotherms could be drawn that correspond almost exactly with the northern boundaries of the several zones. In the case of the southern boundaries a greater difficulty was encountered, for no data had been published bearing on the temperature control of southward distribution. At the same time it seemed evident, from data previously collected by the division, that species are limited in their southward distribution by the mean temperature of a brief period during the hottest part of the summer. For experimental purposes the mean normal temperature of the hottest six consecutive weeks of summer was assumed to be the factor desired, and this temperature was platted for a large number of localities. Isotherms were then drawn which marked the southern boundaries of the several zones along the Atlantic coast, and it was found that in ranging westward these isotherms conformed throughout to the tortuous boundaries of the Boreal, Transition, and Upper Austral zones, previously mapped from a study of the actual distribution of animals.

The most zealous upholder of the laws of distribution of animals does not claim that the subject has been disposed of in all its details; but it is believed that the general principles controlling the geographical distribution of animals have been discovered, and that they may be expressed as follows:

1. In northward distribution animals are restricted by the sum of the positive temperatures for the entire season of growth and reproduction. 2. In southward distribution they are restricted by the mean temperature of a brief period during the hottest part of the year. It is believed that these two principles cover the fundamental facts of distribution. The modifications of land and water are always to be considered. Consult: Reports of United States Department of Agriculture; especially, 'North American Fauna' (No. 3, 1890); 'Insect Life' (VII. No. 4, 1895); 'North American Fauna' (No. 5, 1891); 'North American Fauna' (No. 7, 1893); also Allen, 'Geological Distribution of the Mammalia' (Bulletin U. S. Geological Survey No. 4, Vol. IV.); Baird, 'Distribution and Migration of North American Birds' (Series 2, Vol. XII. of 'American Journal of Science and Arts'); and Coues, 'Fur-bearing Animals,' etc.

Chief Div. Ornith. and Mam., U. S. Dept. Agr.

Distribution of Plants. See Plant Geography.

District, in the United States. The term has been used historically and currently in five legal senses, besides the vague one of "section of country." (1) Organized bodies of territory administered by the Federal government, not populous or compact enough for Territorial institutions, or for other reasons withdrawn from that system. The District of Columbia, first district, then Territory, then district again; Alaska before its Territorial organization; and from 1804 to 1812 that portion of the Louisiana

Purchase north of the present boundaries of the State of Louisiana, are instances. (2) The counties in South Carolina were called districts till late in their history. (3) A State or portion of a State in its function as the seat of jurisdiction of a United States court. (See DISTRICT COURT.) Judicial districts never cross State lines. (4) Politically, a section of a State or municipality fixed by law for purposes of legislative or congressional representation. Where the former is based on counties, it is always a defined part of a county, never crossing the lines; if on towns, usually the State senate is chosen from districts made up of certain towns or parts of cities, equally, never confounding two. The Congressional districts are marked off by the State legislature after the new apportionment of a census; sometimes in such a way as to give the party then in control of the legislature a greater number of congressmen than its share of the popular vote entitles it to. (See GERRYMANDER.) (5) A taxing district, by decision of the Supreme Court, is any section of a State described in a statute or order as to be assessed, without respect to political divisions. A remarkable instance was the abandonment of its city charter by Memphis, Tenn., when plundered into ruin by a political ring, and constituting itself the Taxing District of Shelby County, to escape suits against the city as a corporation.

District of Columbia, the national capital and its adjoining territory, owned and administered directly by the United States government, to prevent its actions being hampered by conflicts with local jurisdictions. It consists of 60 square miles of land and 10 of water on the eastern side of the Potomac, at the head of deep-water navigation; an enclave in Maryland, with three rectangular sides and the fourth following the lines of the river, besides the islands in the tidal river. Near the southern side of the district, forming the eastern and southern boundary of the city of Washington, is the large tidal estuary of Anacostia River or the eastern branch of the Potomac; the northwest boundary is formed by Rock Creek, separating Washington proper from Georgetown. There are several brooks. The district is flat and marshy for some distance back, then rises into gentle hills and swells; there is pleasing scenery along Rock Creek. The geological formation is Cretaceous, overlaid with drift; in the latter has been found the conglomerate called breccia, from which handsome columns have been carved, used in the capitol. The soil is light, and especially suitable for market-gardening, to which with dairying and the pasturage for the cows it is chiefly devoted, outside the built-up sections. The nature of the capital as a "court city" gives flower-gardening a great importance, and over $500,000 worth are sold annually. The farms are very small — about 35 acres for white and 18 for colored occupants. But little over a fifth of the surface is in farms, however; the city and its suburban villages, the great National Park, and reserved grounds of various kinds, taking up most of it. The climate is excessively variable, but generally humid and warm. The rainfall averages 50 inches a year.

The District originated in the politics of the Confederation time. Until the adoption of the Constitution, the Continental Congress assembled on 10 occasions at 8 different places in succession, at Philadelphia, Baltimore, Philadelphia, Lancaster, Pa., York, Pa., Philadelphia, Princeton, N. J., Annapolis, Md., Trenton, N. J., New York. The first five were during the Revolution. On 21 June 1783 a band of unpaid militia broke up the session in Philadelphia by hooting the members and pointing muskets in at the windows. This emphasized the need of a district guarded by federal troops, and on 7 October Congress resolved to erect a building near the falls of the Delaware (Trenton). The jealousy of the South, however, demanded one also near the falls of the Potomac, and alternate meetings in the two. Finally a majority abolished the second proposition, and a committee was appointed to lay out a town as first voted. There was no money under the Confederation, however, to build or do anything else, and no action was taken on the committee's report. It had been voted to meet in New York till the Federal town was ready; but this was disliked from fear of the "money power" corrupting or overbearing Congress. Philadelphia was proposed, but objected to by the southerners because the Quakers favored abolition. The first Congress under the Constitution revived the government-district plan, but on the banks of the Susquehanna. Finally Jefferson gave a dinner and arranged a "log-roll": two anti-Federalists from the Potomac region, who had voted against the assumption of the State debts by the national government, changed their votes on condition of the Federalists voting to fix the new capital on the Potomac, after remaining 10 years at Philadelphia. The act was passed as agreed 28 June 1790, for establishing the seat of government "at some place between the mouths of the Eastern Branch and the Connogocheague." The first session of Congress was to be held in the new place the first Monday in November 1800. Maryland in 1788 ceded Washington County, and Virginia in 1789 Alexandria County, forming a district 10 miles square; Washington in person laid it out under the Act of 30 March 1791 (having previously sold all his lands in the vicinity). The territory selected included the site of Powhatan's village, Anacostan or Nacochtank; also the existent village of Georgetown, laid out in 1751 and incorporated in 1789,—both on the Maryland side; and on the Virginia side, Alexandria, formerly Belhaven. The site of the new capital itself had been the plantation of one Pope, classically inclined, who by a curious prevision called his hill the Capitol and a brook near by the Tiber. Until 9 September the site was called "The Federal City"; then, by order of three commissioners appointed by President Washington, the district was named "The Territory of Columbia," and the city "The City of Washington." For the latter, see that title; also CAPITOL, where is noted the project, after its burning by the British, of removing the capital north, which was carried by the speaker's casting vote, but buried in committee. In 1846 no Federal buildings having been erected on the Virginia side, nor likely to be, Alexandria County was retroceded to that State. In 1871 the business men of the District, fretting under their political nullity, it was constituted a Territory with a governor and legislature, and delegates in Congress; but was at once seized upon by a ring of speculators who obtained control of its government and plundered it into bankruptcy. In 1874 the territorial government was

1. Soldiers' Home.

2. Falls of the Potomac.

abolished and direct government by Congress restored, through three commissioners appointed by the President and confirmed by the senate.

The commission of 1874 was a temporary government; in co-operation with Congress and the citizens of the District, it framed as a permanent system the Act of June 1878, which the Supreme Court has pronounced "the constitution of the District of Columbia." Under this Act half the expenses of the District, previously laid entirely upon the residents, are paid by the national government, as the owner of more than half the real estate. There is no popular suffrage, the entire executive government being in the hands of commissioners appointed by Congress; they recommend legislation and appropriations to the latter, which in turn consults them in the same matters. The government, though not appointed by popular vote, is nevertheless swayed by public opinion; and so excellent that agitations for restoration of suffrage meet no support. The judiciary of the District dates from 1801.

Population. — 1800: Washington, 8,144; Alexandria, 5,949. 1810: Washington, 15,471; Alexandria, 8,552. 1820: Washington, 23,336; Alexandria, 9,703. 1830: Washington, 30,261; Alexandria, 9,573. 1840: Washington, 33,745; Alexandria, 9,967. 1850: Washington, 51,687; 1860 (same) 75,080; 1870 (same) 131,700; 1880 (District of Columbia), 177,624; 1890 (same), 230,392; 1900 (same), 278,718, of whom 218,196 were in Washington proper and 14,549 in Georgetown. Of these, 20,119 only were foreign born; but 87,186 were colored; (1905) 322,445.

District of Columbia, Courts of. See COURT.

District Courts. See COURT.

Ditch, a trench or fosse on the outside of a fortification or earthwork, serving as an obstacle to the assailant and furnishing earth (déblai) for the parapet (remblai). It is from 90 feet to 150 feet broad, in regular fortifications, and 10 to 12 feet deep below the natural level of the ground. The fosse around a Roman encampment was usually 9 feet broad and 7 feet deep; but if an attack was apprehended it was made 13 feet wide and 12 feet deep. The agger, or parapet, of the encampment was raised from the earth to the fosse, and was crowned with a row of sharp stakes.

Ditchfield, Peter Hampson, English author and clergyman: b. Westhaughton, Lancashire, 20 April 1854. He was educated at Oriel College, Oxford, entered the Anglican priesthood, and has been rector of Barkham, Berkshire, from 1886. He has published: 'An Ecclesiastical History of Reading' (1883); 'The Romance of Mathematics' (1886); 'Our English Villages' (1890); 'Old English Sports and Customs' (1891); 'The National Churches Series — Germany, Spain, Ireland, Netherlands, Italy, France, Scotland, America, England' (1891–7); 'Guide to Berkshire' (1892); 'Sigund,' a cantata (1893); 'Books Fatal to Their Authors' (1895); 'Old English Customs Extant at the Present Time' (1896); 'Bygone Berkshire' (1896); 'The Sorceress of Paris' (1896); 'The Story of Our English Towns' (1897); 'Memorials of Old Buckinghamshire' (1902).

Dithyram'bus, or **Dith'yramb,** in Greek literature, a form of lyric or poem sung in honor of the god Bacchus, at his festivals. Since these festivals were celebrated with all the extravagance which would please the god of wine, the dithyrambus employed in his worship naturally breathed the same frenzy. The character of the dithyrambus therefore requires bold images and lofty periods. The more apparent disorder it contains, the more it partakes of the fire of intoxication, the better it sustains the true dithyrambic character. In the wild Phrygian music it was sung in choirs. Arion of Methymne, in the island of Lesbos, was the first to give a regular choral form to it, about 625 B.C. Lasos of Hermione is said to have been the first who introduced dithyrambic contests into the public games. The expression *dithyrambic poem* denotes, also, any lyric poem filled with a wild and impetuous enthusiasm, as is the case with many odes of Pindar.

Dit'marsh, or **Ditmarshes** (Ger. *Dithmarschen,* "the German marshes"), a district of Holstein in Germany, along the German Ocean, between the mouths of the Elbe and the Eider, so little raised above the sea as to require the protection of strong embankments. Area, 500 square miles. Pop. over 80,000.

Dit'tany (*Dictamnus*), a genus of plants belonging to the rue family (*Rutaceæ*). The members of this genus are beautiful plants, with alternate compound imparipinnate leaves. Their flowers are large, and white or purplish in color. They are arranged in racemes, the peduncles and pedicels of which secrete in numerous more or less prominent glands the essential oil which gives these plants their odor. Their roots were formerly used in medicine; their flowers furnish the perfumer with a fragrant distilled water. The most common species is the *Dictamnus fraxinella,* the leaves of which greatly resemble those of the ash (whence its specific name, from the Latin *fraxinus,* an ash-tree). It is said that in hot weather the odoriferous particles thrown off from this plant form an inflammable atmosphere around it; and if a lighted candle be brought near the plant, especially in a time of drought, there is a burst of flame around the plant. The dittany of the United States (*Cunila origanoides*) belongs to the mint family (*Labiatæ*), and is the only one of the 15 species of the genus native in America. It is an exceedingly aromatic herb, with purple-pink flowers arrayed in loose clusters. It is found from New York to Florida, and west to western Georgia and Ohio. The dittany of Crete is *Origanum dictamnus,* and the bastard dittany is a species of *Marrubium* (hoarhound), both labiates.

Ditters von Dittersdorf, dĭt'tĕrs fŏn dĭt'tĕrs-dôrf, **Karl,** German musical composer: b. Vienna 2 Nov. 1739; d. 31 Oct. 1799. He is particularly distinguished in comic compositions, and perhaps unrivaled in this branch of music among the German composers. Several of his operas were represented with great applause even in Italy: 'Doktor und Apotheker'; 'Betrug durch Aberglauben'; and 'Die Liebe im Irrenhause,' were among the most successful of these. He also acquired considerable reputation by his oratorio 'Esther,' which secured his elevation to a place among the Austrian nobility.

Ditton, Humphrey, English mathematician: b. Salisbury 29 May 1675; d. 15 Oct. 1715. Through Sir Isaac Newton he received the ap-

professorship of mathematical master at Christ's Hospital, which appointment he retained till his death. In 1714, in conjunction with Whiston, he published a new method for finding the longitude at sea, as well as on land. He was the author of several mathematical works, the principal of which are the following: 'General Laws and Nature of Motion' (1705), 'Institution of Fluxions' (1706); 'Treatise on Perspective, Demonstrative and Practical' (1712); 'New Law of Fluids' (1714). He also wrote a 'Discourse Concerning the Resurrection of Jesus Christ' (1712), which was afterward translated into several languages.

Diu, dē'oo, an island of India, belonging to the Portuguese, off the south extremity of Guierat. On a point on the east end of the island is the fortified town of Diu. Pop. 12,630.

Diuretics, drugs used to increase the elimination of urine. Such diuretics may be direct, in that they affect the renal epithelium, or indirect, in that they increase the blood pressure within the kidney and thus increase the urine elimination. This is largely an artificial classification, since it would seem that urine is always a true secretion and not a filtrate, and the renal epithelium must always be involved in the process of manufacture. Still it is a subdivision that has received wide recognition. Diuretics are frequently used in a number of heart, lung, and kidney diseases; because in the normal elimination of urine certain catabolic products are cast off from the body in the urine. If they are retained, however, they give rise to various degrees of intoxication, which may be even fatal. Thus in certain heart diseases, either from insufficient pressure, or from accompanying disease of the blood vessels, the elimination of the ordinary amount of urinary solids may be insufficient and result in poisoning. Hence diuretics, by increasing the elimination of urine, increase the output of these poisonous products. In all patients for whom diuretics are useful, certain concomitant drugs are of benefit. Those namely that empty the bowels freely and those that increase the elimination of perspiration. Of the numerous diuretics the saline salts of potassium, sodium, lithium, calcium, magnesium, the heart tonics, such as digitalis, adonis, caffeine, strophanthus convallaria, theobromine, are most frequently employed. To this list calomel, copaiba, cubebs, juniper, oil of sandal, and other irritating diuretics might be added. Injections of hot water into the rectum cause a pronounced diuresis, and this method is now recognized to be one of the best modes of inducing an increased elimination of urine.

Divan. 1. With the Turks, the highest council of state: the Turkish ministry. Every pasha has also a divan. 2. In the large mansions of the rich in Turkey a divan signifies a large hall for the reception of visitors, which communicates with a number of ante-chambers surrounding it, and which contains sofas placed round the walls, often adorned with costly tapestry and richly embroidered cushions. 3. Divan, with the Arabs, Persians, and Turks, is used to denote a complete collection of lyric poems, which they call ghazals, and through each of which one single rhyme extends; they never exceed the length of 14 strophes. Such a collection is complete if there are as many divisions as there are letters in the alphabet of the respective languages, and each division contains at least one poem, the rhymes of which terminate with the letter under which the division falls; some letters are excluded, as few or no words end in them. Goethe applied this name to a collection of poems by himself, written in the eastern fashion. 4. The word is also applied to a soft cushioned seat for the accommodation of several persons.

Diver, a name properly restricted in ornithology to birds of the family *Colymbida* (q.v.), but applied with little discrimination to various other water birds of similar habits. The compact, depressed body, powerful, posteriorly placed legs with fully webbed feet, the long sinuous neck, and stout acute bill admirably adapt them for aquatic life and the pursuit of fish. They are strong flyers, but on the land are awkward and stand nearly upright. The plumage is peculiarly compact and resistant to water. Three species are well known in the United States. The great northern diver or loon, *Urinator* (*Colymbus*) *imber*, is a large bird, sometimes attaining a length of three feet. Above the plumage is a lustrous black with green and purple metallic reflections, and marked with numerous white spots and streaks; below, a nearly pure white. The loon is distributed throughout the entire northern hemisphere on both fresh and salt waters, and during the winter is found in all parts of the United States, in the northernmost of which it breeds, building its nest among the rushes near or in the water, and laying as a rule but two eggs. The loon is best known by the extreme facility with which it dives at the flash of a gun, thus escaping injury while the ball speeds harmlessly overhead, and for its wild resonant cry, about which many traditions and myths have arisen. It can remain several minutes under water, and swim 100 yards before rising to the surface for air.

The red-throated diver (*U. lumme* or *C. septentrionalis*) is eight or nine inches shorter than the loon, of a rusty black, with profuse small white spots above, white below, with a large distinct chestnut-colored patch on the lower part of the throat. It is distributed like the loon, but is rather more northern, and is found in the United States in the winter only. The black-throated diver (*U. arcticus*) is intermediate between the other two species, from which it is distinguished by a blue-black neck-patch. It is a high northern species, and is represented within the limits of the United States chiefly by a western variety which occurs abundantly on the Pacific coast in winter. Consult: Baird, Brown, and Ridgway, 'Water Birds' (1884); Elliot, 'The Wild Fowl of the United States' (1898).

Dives, dī'vēz (Lat. "rich"), the name popularly adopted for the "rich man" in the parable of the rich man and Lazarus, Luke xvi.

Divi-divi, dē'vē-dē'vē, **Libi-dibi,** or **Libi-divi,** the astringent bean-pods of *Cæsalpinia coriaria*, a tree which grows in northern South America, in the Antilles, and in Mexico, and a member of the family which yields sapan, brazil, and other red woods. The pods are about one inch broad and three inches long, but are generally bent or curled up, and tend to scale off on the outside. They have a pale brown color with a tinge of yellow; sometimes they are spotted and black, and then they are not so good. They are very rich in tannin (especially

in the pod), good samples containing as much as 40 to 50 per cent, and form one of the best tanning materials. They are largely used in calico-printing for blacks and dark shades.

Divide, The Great, or The Continental Divide, names given to an elevated ridge of land in the United States where occurs the parting of the waters which flow to the Atlantic and the Pacific oceans. The name, "The Great Divide," is now commonly applied to a broader extent of country than the Continental Divide or watershed proper. It comprises that region in Montana and Wyoming wherein so many of the large rivers of the United States have their source, and which possesses within itself nearly all the characteristics of a continent. The arrangement of the elevated land masses in relation to the valleys and plateaus is continental; the temperature and vegetation vary almost from that of the tropics to the frigid zones; its mineral wealth is enormous; and its wild animals and great varieties of fish make it the paradise of the hunter and the angler. Its waters flow to the Gulf, the Atlantic, and the Pacific oceans, and streams rise on its eastern border-land whose waters flow to the Arctic Ocean. It is the natural geographical centre of North America.

Dividend, in arithmetic, a number to be divided by another; thus, if 20 is to be divided by 4, 20 is the dividend, and 4 the divisor. In commerce the fractional part of the assets of a bankrupt which is paid to the creditor in proportion to the amount of the debt which he has proved against the estate of the debtor; or the sum periodically paid as interest on loans, debentures, etc., or distributed as profit on the capital of a railway or other company. The sum to be divided is broken up into as many portions as there are bondholders or shareholders to claim them, and the fractional part falling to each holder bears the same proportion to the whole dividend as the amount of stock or shares he holds bears to the whole capital.

Dividing Engine, a machine for marking the divisions on the scales of scientific, mathematical, or other instruments. Some of these machines perform work of extraordinary fineness and accuracy. In making astronomical instruments, spectrometres, metre rods, and such exact instruments, the dividing engine is almost indispensable. Joseph von Fraunhofer was the first to make the instrument for ruling gratings, but others soon followed his lead. See FRAUNHOFER, JOSEPH VON; MICHELSON; ROWLAND; RUTHERFURD; and article on SCREW.

Dividing Range, Great, an Australian chain of mountains, forming the watershed between the rivers flowing into the Pacific and those running westward. It stretches from Cape York on the north to Wilson's Promontory on the south.

Divina Commedia, dē-vē'nā kŏm-mā'dē-ā. See DANTE.

Divina'tion (Lat. *divinatio*), the art or act of foretelling future events, or discovering things secret or obscure, by the aid of superior beings, or by other than human means. The derivation of the word indicates a belief that omens are sent by divine interposition. Natural divination was anciently thought to come by divine afflatus; artificial divination, by signs, omens, etc. At an early time divination formed a regular science, intimately allied with religion and furnished with rules and regulations. Even though divination did not have its origin in fraud, it became a fruitful source of imposition. Moses prohibited divination expressly (Deut. xviii. 11). Saul expelled "those that had familiar spirits, and the wizards," from his kingdom; yet he was weak enough to consult the famous witch of Endor shortly before the battle in which he fell. The Egyptians and Greeks had their oracles. With the Romans divination and witchcraft were brought into a kind of system, and constituted part of their religion. (See AUGURS and ARUSPICES.) The ancient Germans had consecrated white horses, from whose snorting and neighing they drew favorable or unfavorable signs. They also followed the guidance of prophetesses, whom they called *Alrunes*. Many Christians, from the period of the 3d century, adopted the *sortes biblicæ* or *sortes sanctorum* — a mode of judging of the future by opening the Scriptures at random, and forming an opinion from the passage on which the eye happened to fall. (See BIBLIOMANCY.) In early times Virgil's Æneid was also used for the same purpose (*sortes Virgilianæ*). All the ancient Asiatic tribes had modes of divination; and sorcerers are common among the Indians of America. Many of the old forms of divination continue to be practised in Christian nations at the present day, sometimes from superstition, sometimes for amusement, gypsy fortune-tellers being often resorted to. There are many names for the different modes of prognosticating the future by means of the various appearances which nature and art present, from the revolutions of the stars down to the grounds of a coffee-cup. The following by no means exhaust the list, as the different modes of divination that have been practised are almost endless: Aëromancy, divination by air; aleuromancy, by flour; arithmomancy, by numbers; bibliomancy, by the Bible; capnomancy, by smoke; catoptromancy, by mirrors; cheiromancy, by the palm; cleidomancy, by keys; ciromancy, by wax; geomancy, by the earth; hepatoscopy, by the liver of animals; hydromancy, by water; lampadomancy, by lamps; necromancy, by corpses; nephelomancy, by clouds; oneiromancy, by dreams; pyromancy, by fire; rhabdomancy, by rods. The works on this subject are very numerous, including the mystical productions of the East, the Cabala (q.v.), the treatises on astrology, witchcraft, etc., in the Middle Ages, and the studies of more recent writers. See ASTROLOGY; BLACK ART; CUP, DIVINATION BY; CLAIRVOYANCE; ORACLE; PALMISTRY; WITCHCRAFT.

Bibliography.— Bouché Leclercq, 'Histoire de la divination dans l'antiquité'; Cicero, 'De Divinatione'; Ennemoser, 'History of Magic'; Jung-Stilling, 'Theorie der Geisterkunde'; Schneider, 'De Divinationum Origine et Progressu.'

Divine Right, the doctrine that the right of sovereigns to rule is derived immediately from the Deity, whose representatives they are, and that accordingly they are not responsible to their subjects for their method of governing, nor to any other human court of appeal. This was the doctrine to which the Stuarts were so much attached, and which was taught almost universally by the clergy of the Church of England and in the universities after the Restoration.

Even the tyranny of James II. was not enough to induce the English clergy to renounce this favorite doctrine, and after the revolution about 400 of them, including some of the bishops, sacrificed their benefices rather than forsake their principles in the matter. After this time the theory of divine right and passive obedience was little more heard of in England.

Diving, plunging into water and remaining submerged for greater or less periods of time, with or without communication with the atmospheric air. Diving without the aid of some artificial means to supply the diver with air under water is now rarely practised (unless for amusement) except in sponge, coral, and pearl fishing, and sometimes for recovering treasure from wrecked vessels. The best divers are able to remain about one minute and a third under water, and only in extreme and exceptional cases as long as two minutes. Instances are recorded of divers remaining four, five, and even six minutes under water, but these are of questionable authenticity.

To enable divers to remain for a considerable time (sometimes five or six hours) under water a diving dress has been used, which is so contrived that the diver is constantly supplied with air from above. It consists of a waterproof dress, to which is attached a neck-piece or breastplate fitted with a segmental screw bayonet joint to which the head-piece or helmet, the neck of which has a corresponding screw, can be attached or removed by one eighth of a turn. Air is supplied by means of a flexible tube, which enters the helmet and communicates with an air-pump. To allow of the escape of the used air there is another flexible tube which is led from the back part of the helmet to the surface of the water. There is a signal line attached to the diving dress, by which the diver communicates with the attendants, and he carries another line in his hand to guide him in returning to the rope or ladder by which he descends.

The diving apparatus now in use makes the diver independent of any connection with persons above the water. A strong metallic air reservoir of steel is carried on the diver's back. A respiratory tube issues from the chamber, and is terminated by a mouth-piece which is held between his lips and teeth. This tube is furnished with a valve which permits the expulsion of air, but opposes the entrance of water. When the diver wishes to leave the water he inflates his dress with air from his reservoir and immediately rises to the surface.

Diving-bell, a device by which work may be carried on under water with a full supply of atmospheric air. To illustrate the principle of this machine take a glass tumbler, plunge it into water with the mouth perpendicularly downward; it will be found that very little water will rise into the tumbler, but as air is compressible, it could not entirely exclude the water, which by its pressure condensed the air a little.

The first diving-bell we read of in Europe was tried at Cadiz by two Greeks in the presence of the Emperor Charles V. The first of any note was made by Dr. Halley. The diving-bell is most commonly made in the form of a truncated cone, the smaller end being closed and the larger one open. It is so suspended that it may sink full of air, with its open base downward. As a diving bell of the ordinary construction is open to the objection of not being easily moved about, an ingenious kind of diving-bell, called a *nautilus*, has been invented, which is not open to this objection, but which is entirely at the command of the occupants, who can make it sink or swim, and move it about at pleasure, and can use it at the same time to raise great weights and convey them to any desired spot. See DIVING; NAUTILUS.

Divining Rod, a forked rod or branch, generally but not necessarily of hazel, by means of which, according to a popular belief not yet wholly extinct, the presence of water, minerals, etc., underground, can be detected. When used, the rod, which is carried slowly along in suspension, will, as is affirmed, dip and point toward the ground when brought over the spot where the concealed water or mineral is to be found.

Divisibility, the capability of being separated into parts. A metaphysical problem, long discussed by philosophers on abstract principles, is the divisibility of matter. The microscope reveals only to an infinitely small extent the subdivision of substances and tissues, organic and inorganic. Even in the mechanical productions of art distinctness of subdivision is amazing. A slip of ivory, of an inch in length, has frequently a hundred equal parts marked on it, all being distinctly visible. Nobert, a Pomeranian optical instrument maker, is renowned for producing the finest rulings on glass which have hitherto been executed. These test plates, as they are called, contain a number of bands, the coarsest of which in his 20-band plate contains 11,259 spaces to the inch, and the finest, 225,187. Yarn has been spun so fine that one pound of it extended 4,770 miles.

The gold-beaters begin with a ribbon an inch broad and 150 inches long, which has been reduced by passing through rollers, to about the 800th part of an inch in thickness. This ribbon is cut into squares, which are disposed between leaves of vellum, and beat by a heavy hammer till they acquire a breadth of more than three inches, and are therefore extended 10 times. These are again quartered, and placed between the folds of gold-beaters' skin, and stretched out, by the operation of a lighter hammer, to the breadth of five inches. There seems almost no limit to the gold-beater's skill in dividing his tissue of gold, for one grain of gold has been beaten out to a surface of 52 square inches, and leaves have been made 307,500 of which would go to the inch. Iron, the least malleable of the above-mentioned metals, has been reduced to wonderfully thin sheets. Fine tissue paper is about the 1,200th part of an inch in thickness, but at the exhibition of 1851, Gillott, the steel penmaker, exhibited rolled sheets of iron the 1,800th part of an inch in thickness. Since then a sheet has been produced with an area of 55 inches, weighing but 20 grains, and having a thickness of 1-4800th part of an inch.

It has been asserted that wires of pure gold can be drawn of only the 4,000th part of an inch in diameter. But Dr. Wollaston, by an ingenious invention, obtained wires of platinum much finer than this, some of them only the 30,000th part of an inch in diameter. Such excessive fineness is hardly surpassed by the filamentous produc-

tions of nature. Human hair varies in thickness from the 250th to the 600th part of an inch. The fibre of the coarsest wool is about the 500th part of an inch in diameter, and that of the finest only the 1,500th part. The silk line, as spun by the worm, is about the 5,000th part of an inch thick; but a spider's line is perhaps six times finer, or only the 30,000th part of an inch in diameter; insomuch that a single pound of this attenuated substance might be sufficient to encompass our globe. A single grain of sulphate of copper will communicate a fine azure tint to five gallons of water. Odors are capable of a much wider diffusion. A single grain of musk has been known to perfume a large room for the space of 20 years. Some germs are almost inconceivably minute. Thus the germ known as *micrococcus* is a minute spherical body sometimes no greater in diameter than the 32,000th of an inch. The minute organisms to which the name of *bacteria* is specially applied are rod-shaped bodies about 1,000th of an inch in length. Many of the so-called infusorial animalcules are so exceedingly small that myriads of them may exist in a drop of water.

Division, in mathematics, the dividing of a number so as to discover how many times a lesser number is contained in it; one of the four fundamental rules of arithmetic. The number to be divided is the dividend, the number which divides is the divisor, and the result of the division is the quotient. Division is the converse of multiplication.

In military matters the section of an army consisting of two or more brigades, composed of the various arms of the service, and commanded by a general officer. In the navy, a select number of ships in a fleet or squadron of men-of-war. In deliberative legislation the mode of determining a question at the end of a debate. In the House of Representatives at Washington, a division has no traditional formalities, being determined by the rules of the body itself. In the Senate, a division is accomplished by a roll call. In the British House of Commons the speaker puts the question, and declares whether in his opinion the "ayes" or the "noes" have it. Should his opinion not be acquiesced in by the minority, the house is cleared, and the "ayes" directed to go into the right lobby and the "noes" into the left, where they are counted by two tellers appointed for each party. In the House of Lords the two sides in a division are called "contents" and "not-contents."

Division of Labor, in economics, a theory based on the principle that industry can be best carried on when each man has a special work to do. Constant practice in doing the same thing leads to a perfection which could not otherwise be attained. The classical illustration of it in the history of political economy is that of pin-making as given by Adam Smith: "One man draws out the wire, another straights it, a third cuts it, a fourth points it, a fifth grinds it at the top for receiving the head; to make the head requires two or three distinct operations; to put it on is a peculiar business; to whiten the pin is another; it is even a trade by itself to put them into a paper; and the important business of making a pin is in this manner divided into above 18 distinct operations, which in some manufactories are all performed by distinct hands." In this way 10 men could make about 48,000 pins in a day, whereas, if they worked separately and independently, they certainly could not each of them have made 20, perhaps not one pin in a day. Adam Smith offers the following reasons why the division of labor secures greater efficiency: "First, the increase of dexterity in every particular workman; secondly, the saving of the time which is commonly lost in passing from one species of work to another; and lastly, the invention of a great number of machines which facilitate and abridge labor, and enable one man to do the work of many." Economists believe, however, that Smith has laid too great stress on both the second and third of the above reasons.

In biology, a conception borrowed from economics and introduced into biology by Milne-Edwards to describe the difference of function exhibited by the individual members of an animal colony, or by the different organs, tissues, and cells of a single organism. The figure of a hydroid colony, *Hydractinia*, shows how members, primarily and fundamentally the same in structure, become set apart as nutritive, reproductive, sensitive, and protective. The same division of labor or predominance of special functions in different individuals is beautifully illustrated in the *Siphonophora*.

Divitiā'cus, chief of the Ædui, often mentioned in the 'Commentaries of Cæsar.' He was a constant adherent of the Romans, and on one occasion made a visit to Rome, where he became the guest of Cicero, who mentions him in his book, 'De Divinatione,' as belonging to the order of the Druids, and professing much knowledge of the mysteries of nature and the art of divination.

Divorce, the disruption, by the act of law, of the conjugal tie made by a competent court on due cause shown. In the United States, jurisdiction in divorce cases is usually conferred on the law courts by the statutes in the different States. The causes of divorce enumerated in these statutes are by no means uniform in relation to the various States, and are more numerous in many of the western States than in the eastern. In most of the States divorce may be granted on any of the following grounds: adultery, conviction of felony, cruel and inhuman treatment, wilful desertion for periods varying from one to three years, habitual drunkenness, impotency, or neglect to support the wife. In New York adultery is the only cause of absolute divorce. In South Carolina the courts have no power to grant divorce, strictly speaking, the legislature being the only authority for that purpose. In both of these States, as in others, the courts may declare an alleged marriage invalid on grounds which rendered the parties or either of them incapable of contracting it, such as idiocy, lunacy, former husband or wife living, etc. Separation from bed and board, commonly called limited divorce, is granted on the ground of cruel and inhuman treatment; or desertion and refusal to support by the husband may be a ground for a decree setting the wife free from the interference and control of her husband, though it may not sunder the marriage tie.

A person applying for a divorce will not be allowed to obtain judgment should it appear that he or she has been guilty of the same offense, or that there is collusion between the persons concerned in order to procure a divorce; for

the same reason the plaintiff is always required to prove the existence of the grounds of divorce by satisfactory evidence, even though no contest is made on the other side. Parties also who have condoned the offense, that is, who, after it has been discovered, have consented again to live as husband and wife, are not allowed to obtain a divorce, but a second act of the same nature revives the right of action on the original offense.

The want of harmony in the legislation of the different States on this subject has led to very great confusion and conflict in regard to the rights and liabilities growing out of divorce against non-residents of the State where granted, and some uniform system of laws on the subject is greatly needed. As the jurisdiction of Congress over the subject is doubtful, uniformity can apparently be secured only by an amendment to the Constitution of the United States, or by the concurrent action of the various State legislatures.

By a late report made to Congress by Carroll D. Wright, commissioner of labor, on the subject of marriage and divorce, it appears that the whole number of divorces granted in the United States for a period of 20 years, commencing with 1867, was 328,716, of which 30,072 were granted in Illinois, 25,193 in Indiana, 15,355 in New York, 8,542 in Connecticut, 2,642 in New Jersey, and 163 in South Carolina. The ratio of marriages to one divorce for the same period was lowest in Rhode Island, being 11.11 marriages to each divorce. The cause for which the greatest number of divorces were granted was desertion, divorces on this ground numbering 120,557, or over 38 per cent of the whole number of divorces granted.

The differences in the divorce laws in the States account somewhat for the differences in the number of divorces granted in certain States. A large number of the divorces granted in some of the western States, where high divorce rates prevail, have been obtained by persons residents of other States before the statutory limit of time necessary for a residence in a State, which must elapse before beginning proceedings for a divorce. There are more divorces, in proportion to the population, granted in the United States than in Europe. The number of divorce courts in the United States will account in a great measure for this difference; about each county court, except in New Mexico, New Jersey, and South Carolina, or about 2,921 courts, have the power of granting divorces. There is but one divorce court in England, 28 in Germany, and 79 in France. Canada has few applications for divorce. In the 21 years ending with 1888, 94 divorces had been granted in Nova Scotia and New Brunswick together, and 41 in all the rest of the Dominion of Canada.

In England, the divorce court is composed of a judge ordinary, the three chiefs in the courts of common law, and three puisne judges. It is provided that either spouse may obtain a divorce on the ground of adultery, but in case the wife is petitioner the adultery must be accompanied by cruelty or desertion. By another act the power to pronounce a decree of divorce, which was at first reposed in the whole court, is given to the judge ordinary sitting alone; but in this case the decree so pronounced is a decree *nisi* and cannot become final for at least six months. After a decree of divorce the offending person is free to marry again, even with the paramour. But it is also enacted that no clergyman shall be compelled to solemnize the marriage of any person who has been divorced. He must, however, allow another clergyman, if willing to do so, to perform the marriage. The same general rules as to collusion, condonation, the conduct of the parties, etc., which obtain in the United States are law also in England. In order to guard against fraud by parties conniving to procure a divorce, power is given to the queen's proctor to interpose, in case he has reasonable grounds to suspect collusion or recrimination, in order to oppose a petition for divorce. By these acts parties are also entitled to obtain a judicial separation on the ground of adultery, cruelty, or desertion. Judicial separation is declared to be in place of a separation "a mensa et thoro." A married woman, having obtained decree of judicial separation, is declared to be in all respects as a "femme sole" in regard to any property that she has or may acquire. Even before obtaining a separation a woman deserted by her husband may obtain from the court a protection for any property that she has or may acquire by her own industry.

In France there has been great opposition to any laxity in the divorce laws, but since the year 1884 French law has recognized three grounds of divorce: (1) adultery; (2) outrage, cruelty, or previous injury; (3) conviction of an infamous crime. These causes of action are equally available to husband or wife; but it is provided that the wife shall not marry again till after the expiration of 10 months from the date of the dissolution of the previous marriage. It is further provided that, in cases where divorce is sought on the ground of outrage, cruelty, or grievous injury, immediate divorce shall not be granted, but the parties may be granted separation for a year, with due provision for the wife's support during that time, at the end of which a final divorce may be granted if they have not been reunited in the meantime. Substantially the same rules as to condonation prevail as in the United States. All the proceedings necessary in such cases are carefully provided for by the code civil, as well as the consequences to the parties personal or proprietary.

In Germany, the question of divorce gave rise to a long contest. The General Prussian Code permitted divorce on the ground of mutual consent and deep-seated aversion, but on account of the newly-awakened religious life in the 19th century there was a strong opposition; this under Friedrich Wilhelm IV. arose to an overwhelming power. Many attempts were made to establish the laws of divorce on other bases, but on account of the personal antagonism of Friedrich Wilhelm IV. they remained without result. The demand for a biblical ground of divorce was fulfilled by the state, because the Bible does not offer a genuinely comprehensive ground of separation. It was considered that the Prussian law of divorce was lax and capricious and there was a unanimous demand for a more strenuous law in the interest of morals. This demand found recognition even in circles which were most opposed to ecclesiastical influence in politics. The opposing elements were reconciled by the personal influence of Wilhelm IV.; nevertheless the attempts of the legislatures to make a new regulation of divorce remained without results. At the present time attempts are being made for bringing about a common divorce law

for all of Germany. This proposed law rests theoretically on very strict principles which find justification in the motives. The Austrian code of common law allows to non-Catholic Christians separation from the bonds of matrimony on account of adultery, malicious desertion, five years' imprisonment, or on account of dangerous diseases, and repeated cruelty of treatment and invincible aversion.

Among the Jews: The enactment of the Mosaic law was the following: "When a man hath taken a wife, . . . and it come to pass that she find no favor in his eyes because he hath found some uncleanness in her, then let him write her a bill of divorcement, and give it in her hand and send her out of his house" (Deut. xxiv. 1). Here, it will be perceived, impurity is the only assigned cause for such divorce. The woman sent away might marry another man, but if he, too, divorced her, it was not permitted her first husband to take her again. The word "uncleanness" in the passage now quoted is a free translation: the Hebrew words mean literally "the nakedness of a thing." The exact import of this expression was sharply contested in the immediately pre-Christian times, the school of Hillel giving it a general meaning, and holding that a man might divorce his wife for the most trivial cause; while that of Shammai considered that the doubtful phrase signified adultery, for which therefore alone a man could put away his wife.

The Mohammedan law of divorce, founded on some passages in the Koran, allows of a separation by mutual consent, giving the wife the right of retaining her marriage portion, unless she agrees to relinquish a part of it as the price of the separation. The parties are permitted to separate and re-unite twice, if they can so agree without any particular conditions; but after the third divorce the husband is not permitted to receive his wife again until she shall have previously married another husband. The act of divorce is a judicial proceeding before the cadi, who does not decree it until three months after the application.

The Hindu and Chinese laws of divorce show little regard for women, and not only the causes recognized in European and American countries, but others are deemed sufficient for a husband to discard his wife.

The different Grecian states had each their respective laws of divorce. At Sparta they do not seem to have greatly regarded the delicacy of the marriage bed when the interest of the republic was in question; but divorces appear to have been rare, since the *ephori* fined Lysander for repudiating his wife. At Athens either the husband or wife might procure a divorce by exhibiting a bill for this purpose to the archon, and obtaining the verdict or consent of a jury to whom the question was referred. But the party applying must, it seems, have made application personally; and Alcibiades, according to Plutarch, took advantage of his authority as a husband to prevent his wife from making the application personally; for when she was going from her brother's house, where she had taken refuge, to the archon's to sue for a divorce, he forcibly seized upon her, and confined her to his own house.

The early laws of Rome permitted the husband to divorce his wife for poisoning his children, counterfeiting his keys, or adultery. But other causes were afterward added; for the first divorce recorded was for the sterility of the wife. This was by Sp. Carrilius Ruga, about 230 B.C. Divorces afterward became very frequent, and a law was, on this account, made by Augustus, requiring additional ceremonies in a divorce; among other things, the presence of seven witnesses to the act of dissolution of the marriage. By the Theodosian code the husband could divorce the wife for adultery, or if she was a witch or a murderess, had sold a free-born person into slavery, violated a sepulchre, committed sacrilege, been accessory to theft or robbery, was given to feasting with strangers without the knowledge or against the wishes of the husband, lodged abroad without good reason, or frequented theatres and shows, her husband forbidding, or was aiding and abetting in plots against the state, or dealt falsely, or offered blows. The wife had equivalent rights in this respect, for she could procure a divorce on similar charges against her husband. He could be re-married immediately; she, not within a year.

The facility of divorce continued, without restriction, under the Roman emperors, but as the modern nations of Europe emerged from the ruins of the Roman empire, they adopted the doctrine of the New Testament (Matt. xix. 6), "What God hath joined together, let not man put asunder."

Divorce, under the laws of the Roman Catholic Church is never allowed where the marriage has been duly contracted, ratified, and consummated. But a perfectly valid marriage contracted between baptized persons can be annulled by the Pope, before its consummation, never after consummation. It is held by canonists that a marriage lawfully and validly contracted but not consummated is annulled by either of the parties taking solemn life-time vows of continence and entering a religious order. If of two unbaptized persons, married, one is converted to the faith and receives baptism, he or she may be released from the marriage bond if the other party refuse to live peaceably and without insult to the Christian religion in the marriage state; and then the released party can marry again. Outside of such conditions as have been stated Christians united in marriage cannot in the Roman Catholic Church be freed from the marriage bond, *vinculum matrimonii*, save after the death of one or other of them. See MARRIAGE AND DIVORCE.

Divorce, Court of. See COURT.

Dix, Beulah Marie, American novelist: b. Massachusetts 1876. She has published: 'Hugh Gwyeth' (1899); 'Soldier Rigdale' (1899); 'The Making of Christopher Ferringham' (1901); 'The Beau's Comedy' (with C. A. Harper, 1902); 'A Little Captive Lad' (1902); 'Blount of Breckenhow' (1903).

Dix, Dorothea Lynde, American philanthropist: b. Hampton, Maine, 4 April 1802; d. Trenton, N. J., 19 July 1887. In her youth she supported herself by teaching in Worcester, Mass., but in 1830 fell heir to some property, after which she devoted her life to the relief and betterment of lunatics, paupers, and criminals. She visited the prisons, asylums, and almhouses of nearly every State in the Union, and by her efforts contributed largely to the establishment of lunatic asylums in those States which had none. She also traveled extensively in Eu-

rope in the same service and her efforts materially improved the condition of the insane there, likewise. She published several children's books, and in 1845 'Prisons and Prison Discipline.' In 1993 a bill was favorably received in Congress appropriating $10,000 for a monument to her at her birthplace. The report of the House Committee declares: "Miss Dix occupies a conspicuous place in history as a philanthropist. Certainly no other woman in modern times has done more to earn the gratitude of the people of this country than this self-sacrificing and devoted woman. Her services during the Civil War as chief of the hospital nurses of the United States and her wonderful success in establishing institutions for the insane — over 30 in number — in the South and West and elsewhere in the country, place her among the noblest examples of humanity in all history." Consult Tiffany, 'Life of Dorothea Lynde Dix' (1890).

Dix, Edwin Asa, American author: b. Newark, N. J., 25 June 1860. He was graduated from Princeton University in 1881; studied law at Columbia College Law School; and was admitted to the bar in 1884. He served as literary editor of 'The Churchman' for a time, and is the author of 'A Midsummer Drive Through the Pyrenees'; 'Deacon Bradbury'; a novel; 'Champlain, The Founder of New France'; and many short stories, sketches, and travels.

Dix, John Adams, American statesman and soldier: b. Boscawen, N. H., 24 July 1798; d. New York 21 April 1879. In 1812 he was appointed a cadet in the United States army, and in 1813, ensign. He took part in the operations on the Canadian frontier during the War of 1812; afterward studied law and was admitted to the bar in Washington. In 1826 he was sent as a special messenger to the court of Denmark. He resigned from the army in 1828, and began practising law in Cooperstown, N. Y. Later he was secretary of state and adjutant-general of New York, and was prominently associated with the "Albany Regency," the controlling power of the Democratic party. In 1841 he was elected to the State assembly, and in 1845–9 was a United States senator. In 1861 he was appointed secretary of the treasury by President Buchanan. At this time there were two revenue cutters at New Orleans, and he ordered them to New York. The captain of one refused to obey his order, and Dix telegraphed to put him under arrest, adding the statement which has made him famous, "If any one attempts to haul down the American flag, shoot him on the spot." At the outbreak of the Civil War, he was elected president of the Union Defense Committee, and organized 17 regiments. He was commissioned a major-general of volunteers, and through his active measures saved Maryland to the Union cause. He was elected governor of New York in 1872, but was defeated on a renomination in 1874.

Dix, Morgan, American Episcopal clergyman: b. New York 1 Nov. 1827. He is a son of J. A. Dix (q.v.). He was graduated from Columbia College in 1848 and from the General Theological Seminary in 1852. He then took orders in the Episcopal Church and after serving for a few years as assistant in Trinity Church, New York, became in 1862 the rector of Trinity parish. In November 1902 the 40th anniversary of his rectorship was celebrated. To the rector of the leading Episcopal church in New York there ever presents itself a great opportunity, and of this opportunity Dr. Morgan Dix has made the best use. Under his wise guidance he has seen Trinity grow in size and power, until to-day the power wielded by its rector is second only to that of the bishop. It has been said of him that "he nominates his own assistants independently of the bishop of the diocese" and that "he presides directly over one ninth of the entire diocese and one fifth of the Episcopalians in Manhattan." Prior to 1901 he had been president of the House of Clerical and Lay Deputies in many successive general conventions of the Episcopal Church. He has published: 'Commentary on the Epistle to the Romans' (1864); 'Exposition of the Epistles to the Galatians and Colossians' (1865); 'Lectures on the Pantheistic Idea of an Impersonal Substance Deity' (1865); 'Lectures on the Two Estates' (1872); 'Memoirs of John A. Dix' (1883); 'The Sacramental System' (1893); 'History of the Parish of Trinity Church' (1899–1901).

Dixey, Henry E., American actor: b. Boston, Mass., 6 Jan. 1859. His earliest success was in the comedy of 'Adonis,' and he has since played many comic parts.

Dixie, Lady Florence Caroline Douglas, English explorer, poet, and novelist: b. London 24 May 1857; d. 7 Nov. 1905. She explored Patagonia 1878–9, was war correspondent for the London *Morning Post* in the Boer war 1880–1, and was instrumental in securing the liberty of Cetawayo, king of Zululand. She published: 'The Songs of a Child and Other Poems'; 'Across Patagonia'; 'In the Land of Misfortune'; 'A Defence of Zululand and Its King'; 'The Child Hunters of Patagonia'; 'Aniwee or the Warrior Queen'; 'Gloriana'; 'Redeemed in Blood'; 'Little Cherie'; 'Ijain, or the Evolution of a Mind'; 'Isola,' a drama; 'Two Castaways'; etc.

Dixie, a name associated in negro minstrelsy with the Southern States. It is supposed to be derived from the name of one Dixie, a large-holding and kind-hearted slave-owner on Manhattan Island in the latter part of the 18th century. His treatment of his negroes caused them to regard his plantation (or "Dixie's") as little short of an earthly paradise, and when any of the slaves were taken away from home they always pined for "Dixie's," while singing and talking of its joys. When slavery moved southward in search of a more secure and congenial habitat, the same ideal of "Dixie's" was taken along, and the chant which the former slaves of Dixie sang of their old home became so widespread that its origin was lost sight of and it came to be applied to the southern homes of the negroes.

In fact in the South "Dixie" is held to mean the Southern States, the word being regarded as a derivation and corruption of "Mason and Dixon's line," (q.v.) which originally divided the free and slave States, and supposed by the Southerners to have first come into use when Texas joined the Union and the negroes frequently sang of it as "Dixie."

Dixon, Charles, English naturalist: b. London, England, 20 July 1858. His entire life has been devoted to natural history study, bird migration and the geographical distribution of species having been his especial field. His pub-

JOHN ADAMS DIX.

lished books include 'Rural Bird Life' (1880); 'Evolution without Natural Selection' (1885); 'Our Rarer Birds' (1888); 'Stray Feathers from Many Birds' (1890); 'Annals of Bird Life' (1890); 'Idle Hours with Nature' (1891); 'The Birds of Our Rambles' (1891); 'The Migration of Birds' (1892); 'Jottings About Birds' (1893); 'Game Birds and Wild Fowl of the British Islands' (1893); 'Nests and Eggs of British Birds' (1893); 'Nests and Eggs of Non-indigenous British Birds' (1894); 'The Migration of British Birds' (1895); 'British Sea Birds' (1896); 'Curiosities of Bird Life' (1897); 'Our Favorite Song Birds' (1897); 'Lost and Vanishing Birds' (1898); 'Bird Life in a Southern Country' (1899); 'Among the Birds in Northern Shires' (1900); 'The Story of the Birds' (1900); 'Birds' Nests' (1902); 'A Popular History of Birds' (1902).

Dixon, Frank Haigh, American educator: b. Winona, Minn., 8 Oct. 1869. He was graduated at the University of Michigan 1892, and has been assistant professor of economics in Dartmouth College since 1898, and secretary of the Amos Tuck School of Administration and Finance since 1900. He has published 'State Railroad Control.'

Dixon, James, American lawyer and statesman: b. Enfield, Conn., 5 Aug. 1814; d. Hartford, Conn., 27 March 1873. He was graduated at Williams College, and achieved distinction in the practice of the law, but turning his attention to public affairs, was repeatedly elected to the Connecticut legislature as a Whig, served two terms in the United States House of Representatives, and was a member of the United States Senate from 1857 to 1869.

Dixon, James Main, American educator: b. Paisley, Scotland, 20 April 1856. He was educated at the University of St. Andrews, was professor of English in the Imperial College of Engineering, Japan, 1879–86; professor of English in the Imperial University of Japan 1886–92, and professor of English literature in Washington University 1892–1901. He has published 'A Dictionary of Idiomatic English Phrases' (1891), and is joint author of an 'Illustrated History of Methodism' (1900).

Dixon, Joseph, American inventor: b. 1799; d. 1869. He was at various times shoemaker, printer, wood engraver, and physician, and establishing crucible works in 1827 at Salem, Mass., became very wealthy. In the course of his experiments he devised important improvements in philography, smelting, bank-note printing, etc.

Dixon, Richard Watson, English clergyman and author: b. London 1833; d. 2 Jan. 1900. He was educated at Oxford; was master in the high school at Carlisle in 1863, and canon of Carlisle in 1874. He became vicar of Hayton in 1873 and of Warkworth in 1883. He published: 'Christ's Company and other Poems' (1861); 'Historical Odes and other Poems' (1864); 'Mano, a Poetical History' (1883); 'Odes and Eclogues' (1884); 'Lyrical Poems' (1885); 'The Story of Eudocia and Her Brothers, a Narrative Poem' (1887); 'Songs and Odes' (1896); 'Essay on the Maintenance of the Church of England' (1875); 'Life of James Dixon' (1874); and 'History of the Church of England from the Abolition of the Roman Jurisdiction' (1880–1900). He was associated with Burne-Jones, Rossetti, and Morris, in founding the 'Oxford and Cambridge Magazine,' the chief organ of the pre-Raphaelite school.

Dixon, Thomas, Jr., American novelist and clergyman: b. Shelby, N. C., 11 Jan. 1864. He was graduated at Wake Forest College, N. C., 1883, and Greensboro, N. C., law school 1886, and admitted to the bar in the last-named year. After serving from 1884-86 as member of the legislature in North Carolina he resigned to enter the Baptist ministry. He was pastor in Raleigh, N. C., 1887; Boston, Mass., 1888–9, and New York 1889–99. Among his works are: 'Living Problems in Religion and Social Science' (1891); 'What is Religion?' (1892); 'Sermons on Ingersoll' (1894); 'The Leopard's Spots' (1902); 'The One Woman' (1903); 'The Clansman' (1904).

Dixon, William Hepworth, English author: b. Manchester 30 June 1821; d. London 27 Dec. 1879. In 1849 he published a memoir of Howard the philanthropist, followed by the 'Life of William Penn' (1851), and by a work on Admiral Blake (1852). In 1853 he became chief editor of the 'Athenæum,' a post which he retained till 1869. During this period he published several very popular works, including the 'Personal History of Lord Bacon,' 'The Holy Land,' and 'New America,' followed by 'Spiritual Wives.' After his retirement from the 'Athenæum,' he wrote some 25 volumes of history, travel, and fiction, among others, 'Free Russia'; 'Her Majesty's Tower'; 'The Switzers'; 'History of Two Queens, Catharine of Aragon and Anne Boleyn'; 'Royal Windsor.'

Dixon, William MacNeill, English scholar: b. India 1866. He was educated at Trinity College, Dublin, and has been professor of English literature and language in the University of Birmingham from 1894. He has published: 'English Poetry from Blake to Browning'; 'A Tennyson Primer'; 'In the Republic of Letters'; 'History of Trinity College, Dublin.'

Dixon, Ill., county-seat of Lee County, situated on the Rock River, about 65 miles above its junction with the Mississippi River, and on the Illinois C., and the Chicago & N. W. railroads. The manufactures of the city are agricultural implements, wagons, shoes, and condensed milk. It is the seat of one of the normal schools of Illinois. Pop. (1900) 7,917.

Dixon Entrance, a strait on the west coast of North America, separating Queen Charlotte Islands from the Prince of Wales Archipelago, and so dividing British territory from a part of Alaska.

Dix'well, John, English regicide: b. 1608; d. 18 March 1689. After the reaction in England which placed Charles II. upon the throne, and caused himself and his associates to be condemned to death, he escaped to America, changed his name, taking that of John Davids, and lived undiscovered among the inhabitants of New Haven, where he was married and left children. In 1664 he visited two of his fellow regicides, Whalley and Goffe, who had found a refuge amid the solitudes of Hadley, Massachusetts. His favorite study in exile was Raleigh's 'History of the World,' and he cherished a constant faith

that the spirit of liberty in England would produce a new revolution.

Dizful, dēz-fool', Persia, capital of the province of Khuzistan, about 100 miles west of Ispahan, on the river Diz. It has over 35 sacred tombs, and nearly as many mosques; but on account of the heat half the town consists of subterranean excavations in the rock. Pop. about 25,000.

Djezzar, jĕz'zär ("butcher"), the name given to Achmed Pasha; b. Bosnia about 1735; d. Acre 1804. He was famous for his obstinate defense of Acre against Napoleon I. He rose, through murder and treason, from the condition of a slave to be Pasha of Acre. In the beginning of 1799 the French entered Syria from Egypt, and advanced from victory to victory till they reached Acre, which was laid siege to on 20 March. By advice of Sir Sidney Smith, Djezzar was induced to hold out; and such was the savage doggedness of his defense that Bonaparte was obliged to retire on 21 May.

Djokdjokarta, dyŏk-dyō-kär'tä, or **Najoedjijo-karto**, a residency on the island of Java, with a capital of the same name. Its only high mountain, the volcano Merapi, is 3,150 feet high. It has no large river. Its forests abound in djatti (teak) wood. It was once an independent kingdom, but it is now controlled by the Dutch. Pop. 441,800. The town is the seat of the native sultan and of a Dutch resident. Pop. 45,000.

Dnieper, nē'pĕr (Russian, Dnjepr, dnyĕp'-ĕr; ancient Borysthenes), a river of Russia which rises in the government of Smolensk, flows south to Kiev, then southeast to Ekaterinoslaff, then south to Androosk, then southwest to the Black Sea. Below Ekaterinoslaff are the famous rapids through which boats must be guided by pilots, and which can be passed only at full tide. The Dnieper begins to be navigable a little above Smolensk. Its total length is 1,230 miles.

Dniester, nēs'tĕr (Russian, Dnjestr, dnyĕs'tĕr; the ancient Tyras; later Danastris or Danastus); a large river of Europe, which has its source in a lake in the Carpathian Mountain, in Austrian Galicia, and flows into the Black Sea, between Ovidiopol and Ackerman. Its length is over 800 miles; and its course is mostly through Russia. Only when the water is very high can ships of small burden ascend as far as Bender.

Doab, doo'ăb (Sanskrit, "Two Waters"), a name in Hindu applied indiscriminately to any tract of country between two rivers. The tract between the Ganges and the Jumna is usually called the Doab; other similar tracts have their distinctive name, as the Bari Doab, between the Bias and Ghara and the Ravi; the Rechna Doab, between the Ravi and the Chenab; and other places.

Doak, Samuel, American Presbyterian clergyman: b. Augusta County, Va., 1 Aug. 1749; d. Bethel, N. C., 12 Dec. 1830. He was graduated from Princeton; was for a time tutor in Hampton Sidney College; and was licensed to preach in 1777. He first settled at Holston, and later at Salem, Tenn., where he built a small church, formed the Salem congregation, and established a school, the first organized in the Mississippi valley. It was incorporated in 1785 as Martin Academy, and in 1795 became Washington College; Doak was its president from 1795 to 1818. He then removed to Bethel, where he founded Tusculum Academy.

Doane, George Hobart, American Roman Catholic clergyman: b. Boston, Mass., 5 Sept. 1830; d. Newark, N. J., 20 Jan. 1905. He was graduated at Jefferson Medical College in 1850, became a deacon in the Protestant Episcopal Church, but later entered the Roman Catholic Church and was ordained priest in 1857. In 1873 he was made vicar-general of Newark, N. J., and in 1886 the Pope made him a domestic prelate with the title of Monsignore. He wrote: 'First Principles'; 'Exclusion of Protestant Worship from Rome'; etc.

Doane, George Washington, American Episcopal bishop: b. Trenton, N. J., 27 May 1799; d. Burlington, N. J., 27 April 1859. He was educated at Union College, and was one of the first six students at the General Theological Seminary in New York. He was ordained deacon in 1821 and priest two years later, having become in the meantime an assistant in Trinity Parish, New York. Here he remained until 1825, when he was appointed professor of rhetoric and belles-lettres in Washington (now Trinity) College, Hartford. This position he held for three years, going then to Boston as assistant and afterward rector of Trinity Church. In 1832 he was consecrated bishop of New Jersey, and took up his residence in Burlington, N. J., combining the rectorship of St. Mary's Church with the episcopate until his death. Besides a vigorous prosecution of general religious work in his diocese, he devoted himself especially to the promotion of Christian education. In 1837 he founded St. Mary's Hall, a boarding and day school for girls, at Burlington, and in 1846 organized Burlington College in the same town. His zeal in this direction, combined with incomplete knowledge of business principles, led to financial embarrassment and ultimately to presentment for trial before his brother bishops; but the charge was unanimously dismissed. In many ways Bishop Doane was far in advance of his time, advocating daily services and the free church system when they were practically unknown in America. He left a large number of published sermons, lectures, and essays, and was also a poet of no mean ability, his best-known poem being that beginning 'What is That, Mother?'

Doane, William Croswell, American Protestant Episcopal bishop: b. Boston 2 March 1832. He is a son of G. W. Doane (q.v.). He was ordained deacon (1853) and priest (1856) in St. Mary's Church, Burlington, N. J., serving as assistant there until the latter date, when he took charge of St. Barnabas' Church Burlington. He succeeded his father in the rectorship of St. Mary's (1859–61), and after holding rectorships at Hartford, Conn. (1861–7), and Albany (1867–9), became in the year last named the first bishop of Albany, on the division of the large diocese of New York. In this position he has acquired a reputation as a wise and statesmanlike administrator, and has been a diligent promoter of religious education. St Agnes' School at Albany was founded by him. He took a prominent part in the second, third,

and fourth Lambeth Conferences, and in the discussions on the revision of the American prayer-book, to which his liturgical knowledge made valuable contributions. He is known as a firm believer in the cathedral system, and has spent much labor on its organization at Albany, including the erection of a magnificent cathedral. His most important literary work is his 'Life of Bishop George Washington Doane' (1860). He has published also: 'Mosaics, or the Harmony of the Collects, Epistles, and Gospels'; 'A Catechism of the Christian Year'; 'The Manifestations of the Risen Lord.'

Doane, William Howard, American composer: b. Preston, Conn., 3 Feb. 1831. He was chief editor of the Baptist 'Hymnal' and has composed numerous popular evangelistic hymns and songs. He has also published more than 20 collections of hymns and several cantatas. He early removed to Cincinnati where he has been president and general manager of a firm of manufacturers of wood-working machinery since 1861.

Doane College, in Crete (q.v.), Neb., a coeducational school, began its legal and corporate existence 11 July 1872. The college was the outgrowth of an academy organized in 1871, which virtually became the preparatory department of the college, which was named in honor of Thomas Doane, a generous benefactor. In 1893 the academy resumed its name, a principal was appointed, and special efforts were made to develop academic life. Doane College is the centre of a group of schools all under the auspices of the General Association of the Congregational Churches of Nebraska. The group is composed of four academies; one at Cnadron, in Dawes County, in the northwest part of the State; another at Neligh, in Antelope County, in the northeast; one at Franklin, in Franklin County, in the south; the fourth at Weeping Water, in Cass County, in the east; with Doane College, the head, at Crete, in Saline County. The motto of the college is, "We build on Christ."

The government of the college is vested in a board of trustees, consisting of 27 members, who are self-perpetuating. Each member serves three years but is eligible for re-election. Each class of graduates from the college names one of its number as a candidate for membership to the board of trustees, and such name is put on the eligible list. Three of the trustees are representatives of the Nebraska Congregational Churches.

The college courses are classical, literary, and scientific; and the degrees granted are A.B., B.S., and B.L. There are departments of music and art. In 1903 there were connected with the school 17 professors, and about 200 students. Connected with the system there were 700 students. The library contained 9,038 bound volumes and 5,673 pamphlets. The college owns 600 acres of land, 90 acres of which are in the campus, and 50 acres have been made into a park. Aid is furnished worthy and needy students. The endowment fund is $166,000, and the annual expenses are $18,000. The college is free from debt.

Dobbs Ferry, N. Y., a residential village in Westchester County, on the Hudson River, and on the New York C. & H. R. Railroad, 25 miles north of the city hall, New York. It is an interesting town historically, having been the scene of many important events in the Revolutionary War. The Yorktown campaign was planned in the Livingston house, and the first salute fired by a British war sloop to the American flag was given opposite this place. Pop. (1900) 2,888.

Dobereiner, Johann Wolfgang, yō hŏn vŏlf'gäng de'bĕ-ri-ner, German chemist: b. Hof, Bavaria, 15 Dec. 1780; d. Jena 24 March 1849. He was professor of pharmacy and chemistry at Jena for 39 years, and discovered the combustibility of platinum, the apparatus for utilizing which is known as Dobereiner's lamp (q.v.). He published 'Zur Pneumatischen Chemie,' and other works. His correspondence with Goethe and Charles Augustus of Weimar appeared in 1856.

Döbereiner's Lamp, a contrivance for producing an instantaneous light, invented by Prof. Dobereiner, of Jena, in 1824. The light is produced by throwing a jet of hydrogen gas upon recently prepared spongy platinum, whereupon the metal instantly becomes red hot, and then sets fire to the gas. The action depends upon the readiness with which spongy platinum absorbs gases, more especially oxygen gas. The hydrogen is brought into such close contact with oxygen (derived from the atmosphere) in the pores of the platinum that chemical union, attended with evolution of light, takes place.

Dobrizhoffer, dō'brĭts-hŏf-ĕr, **Martin,** a Jesuit missionary to the native tribes of Paraguay and author of a voluminous and celebrated memoir on the Abipones, a Paraguayan tribe: b. Gratz, Syria, 1717; d. Vienna 17 July 1791. At the age of 19 he entered the Jesuit order and in 1749, having been ordained priest, was assigned to the mission of Paraguay, in which he spent 18 years, returning then to Austria where he passed the remainder of his life, devoting his leisure to writing his memoir 'Historia de Abiponibus, etc.,' that is, 'A history of the Abipones, a cavalier and warlike people of Paraguay, enriched with copious observations on the barbarous natives, rivers, beasts, amphibia, insects, principal serpents, fishes, birds, trees, plants, and peculiarities of the said province.' A translation of the work (somewhat abridged) by Sara, S. T. Coleridge's daughter, was published in three large volumes (1822). Southey, in his 'Tale of Paraguay,' in complimenting Miss Coleridge upon the faithfulness of her translation of so voluminous a work, and one so full of difficulties for the translator, alludes to the Empress Maria Theresa's generous protection of the author after he and his order had been expelled by the Spanish government from South America and after the order had itself been suppressed by the Pope:

> And if he could in Merlin's glass have seen
> By whom his tomes to speak our tongue were taught,
> The old man would have felt as pleased, I ween,
> As when he won the ear of that Great Empress Queen.

Dobrovsky, dō'brŏf-skē, **Joseph,** Bohemian critic, historian, and philologist: b. Gyermet, Hungary, 17 Aug. 1753; d. Brünn 6 Jan. 1829. He was without a peer in Bohemian learning, ranking among the greatest philologists and critics with his 'History of the Bohemian Language and Literature' (1792); 'Principles of the Old Slavic Dialect' (1822); 'Grammar of the Bohemian Language,' and a wealth of simi-

lar works, all characterized by accuracy and sound judgment, and conferring unparalleled obligations on Bohemian letters.

Dobrudja, dō-bru'ja, or **Dobrudscha,** a territory forming part of the kingdom of Rumania, included between the Danube and the Black Sea. The principal town is Babadagh. Area, 6,102 square miles. Pop. 199,711.

Dobschau, dōb'show (Hungarian Dobsina), Hungary, town about 52 miles northwest of Miskolcz. Its industries comprise bee-culture, flax-growing, and the mining of copper, quicksilver, cobalt, nickel, and iron. It has a noted ice cavern. Pop. (1890) 4,643.

Dobson, Henry Austin, English poet: b. Plymouth 18 Jan. 1840. In 1856 he became a clerk in the Board of Trade, where he is now one of the officials known as principals. His earliest verses first appeared in the magazine called 'St. Paul's,' and were subsequently published in book form under the title 'Vignettes in Rhyme and Vers de Société' (1873). Since then he has published several other volumes of verse, including 'Proverbs in Porcelain' (1877); 'Old World Idylls' (1883); and 'At the Sign of the Lyre' (1885). Among his prose works may be mentioned his Lives of Fielding (1883); Steele (1886); Hogarth (1879); Goldsmith (1889); and Horace Walpole (1890); critical biography of William Hogarth (1891); 'Thomas Bewick and His Pupils' (1884); 'Four Frenchwomen' (1890); three series of 'Eighteenth Century Vignettes' (1892–6); 'A Paladin of Philanthropy' (1899); 'Sidewalk Studies' (1892). His collected poems were published in one volume in 1897. Many of his poems are written in various French forms, such as the rondeau and ballade, and all are marked by gracefulness, ease, and careful finish.

Dobson, William, English portrait painter: b. London 1610; d. Oxford 28 Oct. 1646. Having acquired considerable skill as a painter, he came under the notice of Van Dyck, who introduced him to Charles I. On the death of his patron he succeeded him as sergeant-painter to the king. Among his portraits are those of himself and his wife, Sir Charles Cotterell, Sir Thomas Browne's family, the first Duke of Newcastle, the Marquis of Montrose, Fairfax, and Old Parr; and in addition there are other pictures by him, the chief being 'The Beheading of St. John.'

Doce, dō'sā, a river of Brazil, rising by several streams on the eastern slopes of the Serra de Mantiqueira in the state of Minas Geraes, and flowing to the Atlantic, which it enters about 30 miles northeast of Santa Cruz. It is about 600 miles long, and is navigable up to 120 miles from its mouth.

Docetæ, dō-sē'tē, sectaries who held the human nature of Christ to be an illusion, phantasmal, and not real. The word is from the Greek verb δοκέω, to appear, to seem. The Docetæ were adherents of the Gnostic school and their peculiar dogma was held by a swarm of Oriental sects which preceded and outlived Arianism, both in the East and West. Their denial of the real humanity of Christ was made on the same ground on which Cerinthus (q.v.) denied that the universe is the creation of the principle of all good. That this view prevailed among sects in apostolic times is inferred from a passage in the first epistle of St. John: "Every spirit which confesseth that Jesus Christ is come in the flesh is of God; and every spirit which confesseth not Jesus is not of God."

Dock, a name applied to a large section of the genus *Rumex*, belonging to the buckwheat family (*Polygonaceæ*), chiefly those that are not acid. These are large perennial herbaceous plants, with stout roots, alternate, ovate, and often entire leaves, and bearing panicles of small greenish and usually perfect flowers in whorls. Their roots have an acrid taste, are astringent and styptic and are used in medicine. The root of the water-dock (*Rumex aquaticus*) makes a black color in a solution of sulphate of iron. This plant was greatly venerated by the Druids, who attributed to it miraculous qualities. Numerous species of this genus are known, some widely distributed over the northern hemisphere, 22 species being known in eastern and northern America.

Dock Warrant, a species of warehouse receipt given by a dock-owner to the owner of goods specified in dock warrant, and engaging to deliver them to owners or assignees. The Factor's Act in England has placed dock warrants on the same footing as bills of lading, and in many States of the American Union they have been declared negotiable by statute.

Docket, or **Docquet** (from "dock," to cut short, to abridge), in law, a term indifferently used for a summary of a larger writing; a small piece of paper or parchment containing the heads of a writing; an alphabetical list of cases in a court, or a catalogue of the names of the parties who have suits depending in a court.

Docks and Dock Yards, in the United States. Dock yards, dry docks, lift docks and marine railways are found on the Atlantic coast from Maine to Florida; on the Pacific from California to Washington; along the shores of the Great Lakes, and in the Philippines. On the Atlantic seaboard the most easterly harbor is Bath, Me., which has no dry docks, but a ship railway with a cradle 200 feet long. Extensive shipbuilding, however, is carried on in this city. The Bath Iron Works build and repair large hulls, engines and boilers, turn out shafts of any diameter up to 29 feet in length, and can make castings of 12 tons in weight. Besides the building of iron ships, wooden shipbuilding is carried on extensively at Bath, and most of the famed clipper ships that have made a name for American enterprise and commerce, and challenged the world in their fleet transit over the Atlantic, hailed from Bath, and today "Bath, Me.," is a very common inscription on the sterns of sailing ships.

Portland, at the head of an inlet, the largest city in Maine, has two wooden dry docks of the Simpson type; one being 415 feet long, with 23 feet of water over the sill, and a smaller one with a length of 200 feet. The Portland Company's Locomotive Works have large and heavy machinery suitable for repairing marine engines and hulls of vessels.

Near Portsmouth, N. H., the only seaport in the State, on Continental or Fernald's Island, is the Kittery Navy Yard. The famous U. S. S. Kearsarge was built at this station. Repairs of almost any extent can be made at this yard, and almost any kind of shipbuilding may be

done except the very largest. As a part of the plant, the government is now building a large concrete dry dock, about 750 feet in length over all. This dock will have sufficient capacity to take the largest battleships and merchantmen. The government has in addition a floating dock of 5,300 tons capacity.

Proceeding south the next point of interest is Massachusetts Bay and Boston. At Charlestown, a suburb of Boston, is located the Navy Yard, well equipped for making extensive repairs and for building large engines and ships. Besides the old granite dry dock, built in 1827, the government has now under construction a concrete dock about 750 feet in length over all, with 30 feet of water on the sills. At East Boston is located the plant of the Atlantic Works, covering about 12 acres of land. The largest ship that can be built and launched from the ways of this company is one of 3,500 gross tonnage; to build such ships and overhaul and make extensive repairs, the yard is fitted with a modern plant. This company operates three marine railways, the largest having a capacity of 2,000 tons. The Simpson Patent Dry Dock Company own three dry docks, one of which is 465 feet over all, with 19 feet of water on sill. Near Boston is the city of Quincy, where is located the Fore River Engine Company, with a plant for large and extensive shipbuilding. This company can build the largest class of ships, and is equipped to make the heaviest forgings required in marine work, shafts up to 40 inches in diameter can be turned and bored, and, up to 55 feet in length, can be bored without turning end for end. Although construction work is their chief industry, some repair work is done, and the company is now contemplating the construction of a floating dry dock of the largest size.

At Bristol, R. I., are located the famous shipyards of the Herreshoff Manufacturing Company, where most of the yachts were designed and built which have so successfully defended the America's Cup. Besides yachts, small ships are built at this yard.

At New London, Conn., once famous as a port from which whalers and sealing crafts hailed, is the home of the Eastern Shipbuilding Company, which concern recently launched the S. S. Minnesota, and is now building the S. S. Dakota, which will be launched in the fall of 1903, two of the largest steamships ever built. They are destined to be used in the Oriental trade, and are to ply from Seattle, Wash., to Japan and China. This company has no dry dock at the present time, but are contemplating the construction of some docks of very large capacity. The Morgan Iron Works are also located at New London. Their plant is designed for large and extensive repairs, and the construction work done at this plant is principally engines and boilers. A naval station located at New London is of little importance in so far as construction or repairs are concerned.

Between New London and New York there are no harbors or works of importance to shipping interests. At New York one finds an outer and inner harbor.

On the easterly shore of the inner harbor, and on the East River, the government has established the largest navy yard in this country. A thoroughly efficient and modern shipbuilding plant forms part of the equipment, and large ships can be built. The ill fated U. S. S. Maine was constructed at this yard. Three dry docks are now in commission, and a fourth one about 571 feet long is under consideration. The existings docks are: One granite dock 362.2 feet over all; one originally wood and recently reconstructed of concrete 491 feet over all, and finally a timber dry dock 658.9 feet over all. The largest ship in the navy can be docked here, and thoroughly overhauled and repaired. Besides the Navy Yard plant, New York harbor is well supplied with shipbuilding plants and shipyards. The largest private docks are owned by J. N. Robins Company, one being 510 feet over all, with 22 feet of water on the sill, and one 600 feet over all, with 25 feet of water on the sill. These two are built of wood of the Simpson type. This company owns several floating docks, the largest being 353 feet long with a lifting capacity of 6,000 tons. The J. N. Robins Company are concerned principally in making repairs, and almost any of the Trans-Atlantic ships can be docked at their yard. The Townsend and Downey Shipbuilding Company, located on Shooter's Island, between Staten Island and New Jersey, has facilities for building and repairing steel vessels, and have two marine railways capable of handling vessels of not more than 5,000 tons.

Near the mouth of Newark Bay, in Elizabeth, N. J., the Crescent Shipyard Company has established a plant where tug boats, oil barges, light draught river steamers, yachts, gunboats, torpedo boats, submarine boats, etc., etc., are built. The 345 foot steel car float for the Cape Charles route of the New York, Philadelphia & Norfolk line is the longest vessel constructed at this yard, with a 47 foot beam and a depth of 12½ feet. Another large vessel constructed here is the 3,200 ton U. S. S. Chattanooga. Not owning any docks of their own the Crescent Company make use of those belonging to the New Jersey Dry Dock & Transportation Company, also at Elizabeth.

At other points in New York harbor are located floating docks with a capacity sufficient to enable them to lift almost any of the vessels docking at New York, except the largest Trans-Atlantic liners. The principal ones being the Morse Shipbuilding Company in South Brooklyn, with a lift dock capable of handling vessels of not over 15,000 tons, and the Tietjen & Lang docks at Hoboken, with four lift docks for small repair work; also at Hoboken is located the W. A. Fletcher Iron Works, where are constructed and repaired boats of the class used in inland navigation of this country.

Near Philadelphia is located the League Island Navy Yard. This yard is well equipped to make all kinds of repairs, both large and small. The existing dry dock is 491.7 feet over all and has 25.5 feet of water over the sill. A concrete and granite dry dock is now in course of construction, 739.5 feet over all, with 30 feet of water on the sill. Cramps Shipyard, established in 1830, and the best known private yard in this country, is located in Philadelphia. Here most of the United States battleships were built. A large fleet of both naval and merchant ships were built at this yard. The Simpson dry dock of this company is 462 feet over all. Philadelphia is particularly well adapted to do repair work, and, if not the largest manufacturing city in the United States, the facilities for the con-

struction and repair of engines, boilers, etc., are unexcelled. Across the Delaware River at Camden, is located the New York Shipbuilding Company, who, with a modern yard, with covered shipways and the most up to date appliances, are capable of constructing and repairing vessels of any size. These works are still in their infancy, but they have a large capacity.

At Wilmington, Del., are located the Harlan & Hollingsworth Company, which can construct ships up to 450 feet in length, with proportionate beam, and equip same ready to go into commission. Their Simpson dry dock is 350 feet long, with 13½ feet of water over the sill. The yards are equipped not only to build, but to make extensive repairs.

At Baltimore large and extensive shipyards have been built in the vicinity on the Patapsco River. At this point the Baltimore Shipbuilding & Dry Dock Company have facilities for docking ships 437 feet in length, 45 feet in width and 22 feet in depth, their dock being 504 feet long on top, with 23 feet of water on the sill. The range of the tide is about one foot. The plant of this company is up-to-date, and they can handle both old and new work economically and with despatch. There are two large dry docks, one the property of the Columbia Iron Works & Dry Dock Company, 505 feet over all; the other 600 feet over all, belonging to William Skinner & Sons. There are also several machine shops and shipyards at this point, where large and extensive repairs can be made. The Columbia Iron Works & Dry Dock Company, the Enterprise Marine Engine & Boiler Works, the People's Machine & Boiler Works, and the Maryland Steel Company are all large works for repair and construction.

Newport News, Va., is the home of the Newport News Shipbuilding & Dry Dock Company, which has a large and extensive plant, where the largest ships, both naval and mercantile, can be built, overhauled and repaired. The two Simpson dry docks at this point are 610 feet and 827 feet, respectively, in length on top. Vessels up to 64 feet beam can be docked.

The Norfolk Navy Yard at Gosport, opposite Norfolk, Va., has a granite dock 319 feet 8 inches long, and a timber dock 491 feet over all. The shops at this yard are of sufficient capacity to build as well as to repair government vessels.

At Port Royal, S. C., the Navy Yard at this point has one timber dock 484 feet 6 inches long, of sufficient size to allow 10,200 ton ships of the class of the U. S. S. Indiana to be docked. This yard is only adapted to make repair work. At Pensacola, Fla., the government has a floating dry dock 201 feet 2 inches long. Moderate repairs can be made at this station. The works of Cosgrove & Company, and Cready & McClintock, where large repairs can be made, are also located here.

At New Orleans, La., there are two floating docks of 200 and 300 feet in length which can be used together to give a length on the keel blocks of 487 feet; the Johnson Iron Works, A. A. Mims, and the Whitney Iron Works do the work of repairs in conjunction with the docks. The U. S. Naval Station is situated at Algiers in the vicinity of New Orleans, where government has a steel floating dock 525 feet long. The yard is not well equipped to do any work excepting very small repairs.

The harbor of San Francisco, the largest city of the Pacific slope, is well supplied with yards and docks for construction and repairs of ships. The California Dry Dock Company has a stone dock cut in the solid rock at Hunters' Point, where the U. S. S. Oregon has been docked. This company, with the Risdon Iron Works, are well fitted to do the heaviest machine work. The dock referred to above is 490 feet long with a depth of 23 feet over the sill. The Union Iron Works in this city have a 440 foot steel hydraulic lift, with a 4,750 ton capacity. They are well adapted to build the largest ships, both naval and merchant. This yard was made famous as the builders of the 9,000 ton U. S. S. Oregon, which made the run around the Horn during the Spanish war, and arrived at the Cuban coast fit and ready to take part in the battle of Santiago. In addition to the hydraulic lift, this company operates 2 large graving docks, one 420 feet long, with 28 feet of water on the sill, the other 700 feet long, with 30 feet of water on the sill, and several smaller ones with a capacity of 1,200 to 1,600 tons.

The Naval Station of California is located at Mare Island. This station possesses two docks, one 510 feet 6 inches long, built of granite, the other 730 feet 6 inches long over all in course of construction of granite and concrete. The yard is equipped for large and extensive repairs with a 100 ton crane.

The only other dry dock of large capacity on the Pacific coast of the United States is the naval dock at Port Orchard, Wash., within the limits of the Puget Sound Naval Station. This dock is built of timber and is 640 feet long, with 30 feet of water on the sill. The largest ship which has been docked here is the U. S. S. Oregon, with a tonnage of 9,000.

A great development has taken place in recent years in the docking and shipbuilding industries along the shores of the Great Lakes. At West Superior, Wis., a large shipping business is done in wheat and ores, large elevators and coal docks handling the freight, which is shipped chiefly by water. The American Ship Barge Company have located their yards and dry docks at this point. These yards are of sufficient capacity to make extensive repairs to ships employed on the Lakes. The two docks of this company are 537 feet and 606 feet long, with 18 and 17 feet, respectively, depth of water over the sill.

At Marquette, Mich., the water front is lined with immense docks designed for handling the vast ore business of this region. It is not supplied with any dry docks, but the Lake Shore Iron Works, located here, build and make extensive repairs to machinery. At Sault Ste. Marie, located near the Ste. Marie Rapids on the Ship Canal, a large dry dock is contemplated. The Soo Ship Canal, built (1853) to avoid shooting the rapids, was reconstructed and enlarged in 1881. The largest lock, completed in 1896, is 800 feet long, and of sufficient depth over the sill to accommodate vessels of 21 foot draught. The pumps are of sufficient capacity to empty the lock in seven minutes.

At Milwaukee, Wis., there are several small timber dry docks 312 and 315 feet in length, with 15½ and 16 feet of water over the sills. Disabled vessels can secure ordinary repairs to machinery at the shops of the Vulcan Iron Works or the Milwaukee Boiler Works. The Vulcan Iron Works can turn out shafting 10

inches in diameter and 20 feet long, and can finish screws up to 14 feet in diameter. Their limit in castings is 13 tons.

Chicago is well supplied with dry docks and yards and shops where vessels can be repaired and thoroughly overhauled. The Chicago Shipbuilding Company owns the largest dry dock in the city; it is 525 feet over all, having a depth of water of 18 feet over the sill, and of sufficient capacity to dock lake steamers. Their shops and plant are large enough to make extensive repairs to the hulls and engines of vessels, and they further own an extensive shipbuilding plant, enabling them to build as well as overhaul the largest inland water vessels. The Marine Engine Works can make all ordinary repairs to engines, turn out shaftings 30 inches in diameter and 35 feet long, and make castings up to 20 tons in weight. The Samson Steam Forge Company turn out heavy forgings and finish same, and weld tubes up to two inches in diameter by electricity. There are, besides these, numerous boiler and machine shops where vessels may be thoroughly overhauled and repaired.

At Port Huron, Mich., a 412 foot over all timber dry dock, with 18 feet depth over the sill, affords sufficient capacity to receive the large lake steamers. The Dry Dock Iron Works and the Phœnix Iron Works repair machinery, engines and boilers. There is a floating dry dock in the harbor owned by the Wolverine Dry Dock Company, 210 feet long, with a lifting capacity of 1,000 tons.

Detroit has several large timber dry docks owned by the Detroit Dry Dock Company, the largest being 412 feet long over all and having 18 feet of water over the sill. This company owns a shipyard plant where wooden ships are built, and they make extensive repairs to machinery, engines and boilers. Shafting up to 12 inches in diameter can be made by this firm, and engines with L. P. cylinders 62 inches in diameter have been built at their works. The Eagle Iron Works also build machinery.

At Toledo, Ohio, the Craig Shipbuilding Company builds and repairs hulls and small engines, having no facilities for doing work of any great magnitude; they own, however, the largest dry dock in the city, it being 425 feet long over all, with 16 feet of water over the sill. The Eagle Machine & Iron Works and the Toledo Foundry & Iron Works build, overhaul and repair machinery. At Lorain, Ohio, the Cleveland Shipbuilding Company have built a 560 foot over all dry dock, with 17 feet of water over the sill. This dock can accommodate the lake steamers; only small repairs, however, are done.

Cleveland now carries on a large export trade by water as well as by rail, and is one of the most prominent shipbuilding cities on the Lakes. The American Shipbuilding Company has a river frontage of 1,600 feet, all of which is occupied by their yards and is devoted to shipbuilding purposes. The dock frontage of Cleveland, on the Cuyahoga River, is 67,000 feet, of which 6,000 feet is city property, and on the lake front the city owns 9,000 feet out of 12,500 feet of dock frontage. Three wooden dry docks of the following dimensions are available to vessels: one, the largest, being 50 feet wide and 500 feet long, the other two being 50 feet wide each and 450 feet and 350 feet, respectively, in length.

Besides the American Shipbuilding Company, there are a large number of repair and machine shops in active operation. The Cleveland City Forge & Iron Company are capable of building large hulls and engines, and have facilities for repairs of great magnitude. Shafting of any diameter can be made by them 60 feet long and up to 100 tons in weight. This firm built the shaft for the Fall River steamer Puritan, which is 31 inches in diameter, 37 feet long and 42 tons in weight. The Globe Iron Works make extensive repairs to engines, hulls and boilers, and make castings up to 12 tons. They have capacity for turning out shafts 6 inches in diameter and 20 feet long, and turn shafts of any diameter up to 18 feet in length.

The geographical position of Buffalo makes it the emporium of trade of the Great Lakes and its distribution to interstate points and to the Atlantic seaboard. Supplies and raw stuffs brought here by water or train are unloaded and shipped by rail or water, most of the traffic of the Northwest passing through Buffalo. It has a large and well-protected harbor on the Lake, with several miles of water front and ample facilities to handle the immense grain, lumber and coal trade which passes through her port. The harbor is amply fitted out with shipbuilding and repair plants and dry docks, the largest firm being the Buffalo Dry Dock Company. This plant is able to turn out new ships of a capacity of 4,000 to 5,000 tons, as well as to make extensive repairs to vessels. The annual capable output is about four large ships. The four dry docks owned by this company are of the following dimensions:

Dock	1.*	2.	3.	4.
Long on top	478′ 0″	358′ 0″	305′ 0″	381′ 0″
Long on blocks	438′ 0″	326′ 0″	270′ 0″	350′ 0″
Wide at entrance	60′ 0″	65′ 0″	56′ 0″	65′ 6″
Wide on top	84′ 0″	43′ 0″	38′ 0″	45′ 0″
Water on sill at mean water level	16′ 0″	14′ 0″	11′ 0″	12′ 6″

*This dock is capable of taking ships 460′ 0″ long over all.

There are numerous other firms which are engaged in building tugs, scows, dredges, canal boats and small pleasure craft. They, however, do not control any dry docks. The Delaney Forge & Iron Company make heavy forgings, and are capable of forging shafts of any diameter up to 25 tons in weight, 45 feet in length.

At Montreal, the harbor is continually being improved, and only recently new docks and basins have been completed. The Canadian government dock is 300 feet over all; those of Cantin's and Tate's have a length of 400 feet. The docks are located in the Lachine Canal, and to reach Dock No. 1, the government dock, the vessel must pass through two 270 foot locks and sail about one half mile up the canal. A third lock of similar dimensions has to be passed before reaching Cantin's dock. The largest ship docked in dock No. 2 was 258 feet in length and 36 feet beam. Machine shops are connected with these docks, so that repairs can be made while the ship is in dock. The Allan Steamship Company have their plant at this point. Large hulls and engines can be repaired at the Caledonian Iron Works and the Laurie Engine Company's plant; the latter make castings up to 30 tons in weight.

J. A. Bensel,
Engineer in Chief Department Docks, New York.

Dockum, dŏk'kŭm, or **Dokkum,** Holland, town in the province of Friesland, on the Ee River. Pop. 4,158.

Doctor, a term meaning teacher, or instructor, applied by the ancient Romans to those who delivered public lectures upon philosophical subjects. In the Middle Ages, from the 12th century, it came into use as a title of honor borne by men of great learning, as by Thomas Aquinas (Doctor Angelicus), Duns Scotus (Doctor Subtilis), Roger Bacon (Doctor Mirabilis), Bonaventura (Doctor Seraphicus), and other distinguished schoolmen. It was first made an academical title at the University of Bologna, in Italy, which received from the emperor the right of appointing *doctores legum* (doctors of laws). The University of Paris followed in 1145. Soon after the Popes granted the universities the right of appointing *doctores canonum et decretalium* (teachers of the canon law); and when the study of the civil law came to be combined with that of the canon law, the title was changed to *doctor utriusque juris* (that is, teacher of both laws). The faculties of theology and medicine followed that of law in conferring this title. In the universities of Germany the title of Doctor of Philosophy (Ph.D.) is that which regularly corresponds to M.A. in Great Britain and in America, the philosophical faculty corresponding to the faculty of arts. The degree of Bachelor is subordinate to that of Master and Doctor. The degree of Doctor is either conferred publicly, with certain ceremonies, or by diploma. In many cases it is merely an honorary degree, in other cases it is conferred after examination or when the person receiving it has presented a sufficient thesis on a subject connected with the branch of study to which the degree distinctively belongs. In Great Britain and the United States the degrees of D.D. (Doctor of Divinity), LL.D. (Doctor of Laws), and M.D. (Doctor of Medicine) have long been conferred, the first two being generally honorary. At some of the universities the degrees of D.Lit. (Doctor of Literature), and D.Sc. (Doctor of Science) have been instituted in comparatively recent times, at some also that of D.Phil. (Doctor of Philosophy). The degree of Doctor of Music is conferred at the universities of Oxford, Cambridge, Dublin, London, and Edinburgh. The degree may be honorary or conferred after examination.

Doctor Angel'icus, or **Angelic Doctor,** a title bestowed, by common consent of the scholastic divines, and ratified by the moderns, upon Saint Thomas Aquinas (see AQUINAS, THOMAS). Similar titles have been conferred upon other eminent mediæval divines and philosophers; as Saint Bernard of Clairvaux was called Doctor Mellifluus (of honeyed speech); Alexander of Hales, Doctor Irrefragabilis (irrefragable); William Occam, Doctor Singularis (peerless); Duns Scotus, Doctor Subtilis (subtle).

Dr. Jekyll and Mr. Hyde, The Strange Case of, a psychologic romance by Robert Louis Stevenson. Dr Jekyll is a London physician of position and good character, who in youth showed strong capacities for evil, which he succeeded in suppressing for years. By experiment he learns the use of a drug which gives his lower nature intermittent embodiment in the form of a misshapen, repulsive creature of violent passions, known as Mr. Hyde. The baser nature triumphs gradually. Hyde commits murder and then suicide, and Jekyll disappears forever. This was the first of Stevenson's books to become widely popular. It was published in 1886.

Dr. Syntax, The Three Tours of, a series of three books by William Combe, written in verse, and depicting the adventures of a certain Dr. Syntax, clergyman and teacher, who, on his horse Grizzle, sets out "in search of the picturesque." The work is marked by mild satire, and describes many well-sketched types of character and class. It was published in 1809.

Doctor of the Church, a name given to certain eminent churchmen. Benedict XIV. gave as the things required to make a man a Doctor of the Church: first, learning so eminent as to fit him to be a doctor in the Church and a doctor of the Church; second, heroic sanctity; third, the title must be conferred by a declaration of the Pope or of a general council. The third has not always been insisted upon. In canon law four Doctors of the Church are named: Jerome, Gregory, Ambrose, Augustine. Others are called doctors without the formal declaration of Pope or council: Chrysostom, Gregory Nazianzen, Anselm, Isidore, Peter Chrysologus, Hilary, Athanasius, and Basil have not the full office proper to doctors. Others who have been added by declaration of popes are: St. Thomas of Aquin, St. Bonaventura, St. Leo, St. Bernard, St. Alphonsus Liguori, and St. Francis de Sales.

Doctor-fish. See SURGEON-FISH.

Doctor's Commons, in England, the popular name for the courts and offices formerly occupied by the body incorporated in 1708 under the title of "The College of Doctors of Law exercent in the Ecclesiastical and Admiralty Courts." The buildings were situated on the east side of St. Paul's churchyard. The college consisted of a president (the dean of the arches for the time being), and of those doctors of law who, having regularly taken that degree in either of the universities of Oxford or Cambridge, and having been admitted advocates in pursuance of the rescript of the archbishop of Canterbury, had been elected Fellows of the college in the manner prescribed by the charter. The term commons refers to the meals, taken together in a common dining-room. Since the passing of laws in 1857 which made many legal reforms possible the charter of this college of doctors has been surrendered, the property sold, and the corporation dissolved.

Doctrinaires, dŏk-tre-nârz', a term applied to theorists, or theoretical politicians. The name had its origin in France in 1815. After the second restoration of the Bourbons a small number of deputies would neither rank themselves among the friends of absolute power nor among the defenders of the revolution. They supported Decazes while he was minister; and several of them held offices in the ministry, as, for instance, the counselors of state, Camille Jordan and Royer-Collard. Their system embraced a constitutional monarchy, allowing the government more power than the ultra-liberals would admit; and, on the other hand, restricting the royal power more, and admitting less ap-

proach toward the old form of government than the ultra-royalists demanded. They retired with Decazes, and afterward joined the liberal opposition. The first orator among them was Royer-Collard, and their most distinguished writer out of the chamber, Guizot. They received the name of *doctrinaires* because they were looked upon more as theoretical than practical politicians.

Dod, Daniel, American mechanic: b. Virginia 28 Sept. 1788; d. New York 9 May 1823. He was educated at Rutgers College. He devoted himself to the study of steam machinery and the construction of steam-engines; the Savannah, the first steamship to cross the Atlantic, had an engine of his construction. He was killed by the explosion of a boiler on a steamboat, the machinery of which he had altered.

Dodd, Anna Bowman Blake, American author: b. Brooklyn, N. Y. She was married to Edward Williams Dodd in 1883. She has been a voluminous writer for the magazines from her youth. Her published books are: 'Cathedral Days'; 'The Republic of the Future'; 'In and Out of Normandy Inns'; 'Glorinda'; 'Falaise'; 'On the Norfolk Broads'; 'The Struthers'; and 'An American Husband in Paris.'

Dodd, Frank Howard, American publisher: b. Bloomfield, N. J., 12 April 1844. He prepared at Bloomfield Academy to enter Yale, but instead went into business in the employ of his father, M. W. Dodd, succeeding to the business with Edward S. Dodd, as the firm of Dodd & Mead, in 1870. He is now the head of the firm of Dodd, Mead & Co.

Dodd, Moses Woodruff, American publisher: b. Bloomfield, N. J., 11 Nov. 1813; d. New York 8 April 1899. He graduated from Princeton in 1837 and entered the theological seminary, but abandoned his theological course on account of failing health. In 1839 he became a partner with John S. Taylor in the publishing business: Taylor retired the next year, and the surviving partner carried on the business for 30 years, under the firm name of M. W. Dodd.

Dodd, William, English clergyman and forger: b. Bourne, Lincolnshire, 29 May 1729; d. London 27 July 1777. He was graduated at Cambridge in 1749 and became chaplain to King George III. in 1763. In 1777 he was arrested on the charge of forging Lord Chesterfield's name, and was hanged in Newgate.

Dod'der, a family of plants, probably degenerate *Convolvulaceæ*, and known as *Cuscutaceæ*. The characteristics of the family are filiform twining stems, parasitic on other plants, to which they attach themselves by suckers. They have lost all trace of leaves, even the cotyledons of the embryo being no longer distinguishable, while chlorophyll is almost completely absent. In one American species a slight trace of coloring matter has been noticed. The seed germinates very late in spring, and as the seedling rises from the ground a yellow or pink stem soon begins to show the sweeping movements of circumnutation of a climbing plant. If no plant known as the "host" is in the neighborhood for it to take up its quarters on, it falls to the ground, but retains its vitality for some weeks, by which time a victim may probably have germinated. As soon as it touches a living plant it twines firmly round it, and a series of small wart-like adventitious roots (*haustoria*) are developed, from the centre of each of which a bundle of suctorial cells force their way through the epidermis and cellular envelope into the bast, and press against the woody tissue of the host. The portion of the dodder stem below this attachment now dies off, and there is then no longer any connection with the ground. The growing point again circumnutates until it finds a new base of attachment upon the same or a different stem of the host, there to repeat the formation of suckers. In this way a tangled skein of threads is formed, over which, late in the season, the flowers, generally pink, develop in dense clusters, and the black seeds are shaken out of the capsule by the wind, or gathered with the crop. This parasite is often very injurious, fields of flax, clover, and lucerne sometimes showing well-marked patches completely desolated by the pest. These have to be mowed down and burned before new seed has set; while pains must be taken to procure seed free from those of the parasite. Preventive measures are, to make careful examination of the seed (see SEED TESTING), rejecting any that contains dodder seed and any produced upon land known to be infested by dodder. Manure of stock fed upon baled hay should always be viewed with suspicion, because the germinating qualities of dodder seeds are not impaired during digestion. When observed growing among a crop, frequent hoeing and burning are often satisfactory. Pasturing with sheep confined to the infested patches is also practised, the animals being kept for several weeks upon the land and given extra food if necessary. The most satisfactory treatment, however, is clean cultivation or the growing of a crop upon which the dodder cannot grow. There are about 100 species of dodder of wide geographic distribution, of which at least 25 are found in the western and southern parts of North America. The temperate species are all annual, but some of the tropical species are perennial. A common American name is tanglewood. It is a remarkable circumstance that *Cassytha*, a totally unrelated Oriental genus of *Lauraceæ*, has not only assumed the same general mode of life, and the twining, leafless habit, but germinates and penetrates in a precisely similar way.

Doddridge, dŏd'rĭj, **Philip,** English Nonconformist clergyman and author: b. London 26 June 1702; d. Lisbon, Portugal, 26 Oct. 1751. He determined to enter the Nonconformist ministry and was educated at a theological academy at Kibworth, Leicestershire. In 1723 Doddridge became pastor of the dissenting congregation at Kibworth. After declining several invitations from congregations whose rigid ideas of orthodoxy he felt would be uncongenial to him, he settled in 1729 at Northampton as minister and president of a theological academy. Here he continued to preach and train young students for the ministry till shortly before his death. Doddridge was at once liberal and evangelical, and with all his religious earnestness and enthusiasm had humanity enough for such levities as cards and tobacco. His principal work is 'The Rise and Progress of Religion in the Soul' (1745), which has been translated into Dutch, German, Danish, French, and even Syriac and

land. Besides this, may be mentioned 'The Family Expositor' (1739–50); his 'Course of Lectures,' delivered to the students under his charge, and published (1763); and a great variety of sermons on miscellaneous religious topics. His hymns, nearly 400 in number, have carried his name over the English-speaking religious world perhaps the best known being 'Hark, the Glad Sound, the Saviour Comes'; and 'O God of Bethel, by Whose Hand.' His 'Correspondence and Diary' appeared 1829–31. See Orton, 'Life of Doddridge (1766); Sanford, 'Life of Doddridge' (1881).

Dodds, Alfred Amedée, French military officer: b. St. Louis, Senegal, 6 Feb. 1842. He was educated at the Lyceum of Carcassonne and at the military school of Saint-Cyr, and entered the French army as sub-lieutenant in 1864. In 1894 he commanded the expedition which resulted in the conquest of Dahomey and the dethronement of King Behanzen. He was appointed commander-in-chief of the French forces in Indo-China in 1896. He became an officer of the Legion of Honor in 1883, commander in 1891, and a grand officer in 1892.

Dodecahedron, dō-dĕk-a-hē'drŏn, a regular solid bounded by 12 equal and regular pentagons, or having 12 equal bases. A solid having 12 faces.

Dodge, Charles Richards, American textile fibre expert: b. Covington County, Miss., 17 July 1847. He was educated at the Sheffield Scientific School of Yale and was assistant entomologist in the United States Department of Agriculture 1867–77, editing 'Field and Forest' 1874–7. Since 1890 he has been in charge of the fibre investigations of that department. He has published 20 special reports on fibres and fibre industries, including a 'Dictionary of the Fibre Plants of the World.'

Dodge, Grenville Mellen, American soldier: b. Danvers, Mass., 12 April 1831. He was educated at Partridge's Military Academy and Norwich University. He served in the Federal army during the Civil War. After the War he was chief engineer of the Union Pacific Railroad and superintended its construction, and was a member of Congress from Iowa in 1867–9. He succeeded Gen. Sherman as president of the Association of the Army of the Tennessee in 1894, and was also president of the New York Commandery of the Loyal Legion. In 1898 he was made chairman of the President's Commission to inquire into the management of the War Department in the war with Spain.

Dodge, Mary Abigail (pseudonym, "Gail Hamilton," American author: b. Hamilton, Mass., 1830; d. there 17 Aug. 1896. For several years she was instructor in the High School at Hartford, Conn. From 1865 to 1867 she was one of the editors of 'Our Young Folks.' Besides numerous contributions to current literature, she wrote: 'Gala Days' (1863); 'Woman's Wrongs' (1868); 'The Battle of the Books' (1870); 'Woman's Worth and Worthlessness' (1871); 'The Insuppressible Book' (1885); 'A New Atmosphere' (1864); 'Red-Letter Days'; 'Country Living and Country Thinking'; 'A Washington Bible Class'; 'Twelve Miles from a Lemon' (1873); 'Biography of James G. Blaine'; 'Our Common School System' (1880).

Dodge, Mary Elizabeth Mapes, American editor, author, and poet: b. New York 1838, d. Tannersville, N. Y., 21 Aug. 1905. From 1873 she edited 'St. Nicholas Magazine' (New York). Her best-known work was 'Hans Brinker, or the Silver Skates' (1876), which went through many editions and was translated into five foreign languages. Among her other works are: 'Irvington Stories' (1864), 'Theophilus, and Others' (1876); 'Donald and Dorothy' (1883); 'The Land of Pluck'; 'Along the Way,' a collection of poems (1879).

Dodge, Richard Irving, American military officer and writer: b. Huntsville, N. C., 19 May 1827; d. Sackett's Harbor, N. Y., 16 June 1895. He was graduated at the United States Military Academy in 1848. He was the author of 'The Black Hills' (1876); 'The Plains of the Great West' (1877), republished in London as 'Hunting Grounds of the Great West'; and 'Our Wild Indians' (1881).

Dodge, Theodore Ayrault, American military officer and writer: b. Pittsfield, Mass., 28 May 1842. He received his military education abroad. Returning to the United States, he enlisted (1861) in the Union service as a private, attaining the rank of colonel, 2 Dec. 1865. He has published: 'The Campaign of Chancellorsville' (1881); a 'Bird's-Eye View of the Civil War' (1883); 'Patroclus and Penelope: a Chat in the Saddle' (1885); and a series of studies called 'Great Captains,' comprising volumes on 'Alexander the Great' (1890), 'Hannibal' (1891), 'Cæsar' (1892), 'Gustavus Adolphus' (1895).

Dodge, Walter Phelps, American author and lawyer: b. of American parents in Syria 1869. He is a nephew of William Walter Phelps (q.v.). Among his works are: 'Three Great Tales'; 'As the Crow Flies'; and 'A Strong Man Armed.'

Dodge, William Earl, American capitalist: b. Hartford, Conn., 4 Sept. 1805; d. New York 9 Feb. 1883. He received a common school education, entered the wholesale drygoods business, and in 1833 became a member of the firm of Phelps, Dodge & Company, retiring in 1879 with a large fortune. He was president of the New York Chamber of Commerce, trustee of Union Theological Seminary, a founder of the Union League of New York, and an ardent friend of the freedman.

Dodge, William Earl, American merchant, son of the preceding: b. New York 15 Feb. 1832; d. Bar Harbor, Me., 9 Aug. 1903. He succeeded his father in the metal firm of Phelps, Dodge & Company, New York, and was long prominent in his native city as a man of business, philanthropist, and art patron. He was the first vice-president of the American Museum of Natural History and chairman of the Executive Committee of the Metropolitan Museum of Art, in which latter position he had been very active. He gave Earl Hall to Columbia University.

Dodge City, Kan., town, county-seat of Ford County; on the Arkansas River, the Atchison, T. & S. F., and the Chicago, R. I. & P. railroads; about 150 miles west of Wichita. When first settled, as a Texas cattle-shipping point, the place was noted for its lawlessness. It is the trading centre of an agricultural and stock-raising region. It is the seat of Soule Col-

lege, which is under the control of the Methodist Episcopal Church. Pop. 2,000.

Dodgeville, Wis., city, county-seat of Iowa County, situated on the Illinois C., and the Chicago & N. W. railroads, about 50 miles southwest of Madison. The industries of the place are chiefly those of an agricultural region, notably creameries. The lead and zinc mines nearby add to the wealth of the city. Pop. (1900) 1,865.

Dodgson, dŏj'sŏn, **Charles Lutwidge** ("Lewis Carroll"), English mathematician and author: b. 1833; d. Guildford 14 Jan. 1898. He took orders in 1861, and till 1881 was a mathematical lecturer. His first publication was 'A Syllabus of Plane Algebraical Geometry' (1860); in the following year he issued the 'Formulæ of Plane Trigonometry,' and in 1864 appeared his 'Guide to the Mathematical Student.' He still remained quite unknown to the public at large, but in the next year became famous as the author of 'Alice's Adventures in Wonderland,' which, though written for the young, has found not less appreciation among those of riper years, and has been translated into many languages. Equally delightful is the continuation of Alice's adventures narrated in 'Through the Looking-glass and what Alice Found There' (1871), an exception to the common rule as to the inferiority of continuations. Both books were admirably illustrated by Tenniel. 'The Hunting of the Snark: an Agony in Eight Fits' (1876), a fantastic narrative in verse, had by no means an equal popularity, however. Among his other works are: 'Elementary Treatise on Determinants' (1867); 'Phantasmagoria and other Poems' (1869); 'Euclid and His Modern Rivals' (1879); 'Rhyme? and Reason?' (1883); 'A Tangled Tale' (1885); 'The Game of Logic' (1887); 'Curiosa Mathematica' (1888 and 1893); 'Sylvie and Bruno' (1889–93); and 'Symbolic Logic' (1896).

Dod'let, a name sometimes applied to the tooth-billed pigeon (q.v.), (*Didunculus strigirostris*), of the Samoan Islands.

Dodo, dō'dō, or **Dronte** (*Didus ineptus*), the name of a very remarkable extinct bird discovered by the Portuguese, about 1507, on the island of Cerne or Mauritius; and afterward seen there by the Dutch, both at the end of the 16th and in the beginning of the 17th century. The last authentic record shows its survival until 1681. As it was never seen after this, it was deemed by some altogether fabulous: but its actual existence was completely established not only by drawings made by artists who accompanied the Dutch voyagers, and preserved in Utrecht, Vienna, and Berlin, but by fragments of the bird itself; among others, a foot in the British Museum, and both a head and a foot in the Ashmolean Museum, at Oxford. Several other fragments, and even entire embalmed birds, reached certain of the continental museums, but seem to have been mostly lost or destroyed. In 1865, and again in 1889, large numbers of bones of the dodo were found in a marsh in Mauritius, from which an almost complete skeleton has been set up in the British Museum, and others distributed to various collections. The dodo had short and ill-shaped legs and feet, scarcely able to support its clumsy and almost globular body, which was about twice as large as that of a turkey; and a monstrous head which, apparently ill-attached to its body, contained an enormous mouth and terminated in a strong hooked beak. Though covered with thick plumes, it was destitute of wings sufficient for flight, and had their place supplied by mere stumps or rudimentary appendages, covered with soft ash-colored feathers, intermixed with yellowish-white; the tail was composed of a few small curled feathers of the same description. Naturalists are now agreed that the dodo should be put in the order *Columbæ* (q.v.) or pigeons, of which it, with one or two similarly extinct birds from neighboring islands, is the representative of an extremely modified family type (*Dididæ*). The cause of the extinction of the dodo, together with several of its associates in the land fauna of Mauritius, is said to have been the hogs which, let loose from the ships of the early explorers, multiplied greatly and overran the island. Consult: Strickland and Melville, 'The Dodo and its Kindred.'

Dodona, dō-dō'nä, a celebrated town in Epirus, in the neighborhood of which was one of the most ancient oracles in Greece. This oracle long maintained its celebrity. It belonged to the Pelasgic Zeus, who was supposed to dwell in the stem of an oak-tree. The prophetic priestesses announced the divine communications in different ways. They approached the sacred tree, and listened to the rustling of its leaves; or, standing by the fountain at the foot of the tree, observed the murmuring of the water which gushed forth from the earth, and in other ways. The sanctuary at Dodona was destroyed by Dorimachus, the Ætolian general, in 219 B.C. See Zeus.

Dods, Marcus, Scottish theologian: b. Belford, Northumberland, 1834. He was educated in Edinburgh, and in 1858 was licensed as a minister of the Free Church of Scotland. In 1866 he was ordained to Renfield Free Church, Glasgow, where he remained till appointed in 1889 to the chair of New Testament exegesis in New College, Edinburgh. Among his published works some of the most important are: 'The Prayer that Teaches to Pray' (1863, 6th edition 1889); 'Epistles to the Seven Churches' (1865); 'Israel's Iron Age' (1874); 'Mohammed, Buddha, and Christ' (1877); 'Handbook on Genesis' (1882); 'Parables of Our Lord' (1883 and 1885); 'How to Become Like Christ' (1897); 'Genesis, John, and First Corinthians in the Expositor's Bible.'

Dods'ley, Robert, English dramatist and bookseller: b. Mansfield, Nottinghamshire, 1703; d. Durham 25 Sept. 1764. He became a footman, and published by subscription a volume of poems, entitled the 'Muse in Livery,' which attracted public favor, less from its intrinsic merit than from the situation of the author. His next effort was the 'Toyshop,' a dramatic satire. Pope patronized this, and through his influence it was brought upon the stage in 1735. Dodsley was enabled, by his profits as an author, to set up a bookseller's shop in Pall Mall, which ultimately proved very prosperous. He next wrote the farce of the 'King and the Miller of Mansfield,' founded on an old ballad, which succeeded so well that he produced a sequel to it, called 'Sir John Cockle at Court.' In 1741 he brought out a musical piece, entitled the 'Blind Beggar of Bethnal Green.' He subsequently wrote:

'Economy of Human Life,' a well-known collection of moral maxims; a tragedy, 'Cleone'; and a selection of tables in prose, with an 'Essay on Fables' prefixed. He planned the 'Preceptor'; the 'Annual Register' (commenced in 1758); the 'Collection of Old Plays,' which now chiefly sustains his fame as a publisher; and the 'Collection of Poems by Different Hands.'

Dodson, John E., American actor: b. England 1857. He studied law, but early in life went on the stage, appearing first in Manchester; he supported Charles Manchester and other star players in England; and in 1889 came to the United States with Mr. and Mrs. Kendal. His first appearance in New York was at the Fifth Avenue Theatre in 'A Scrap of Paper'; later he joined the Empire Theatre Company as leading comedian. He originated the character of Richelieu in 'Under the Red Robe,' and has taken the part of Richelieu in 'Richelieu's Stratagem,' and the part of John Weatherby in 'Because She Loved Him So.'

Dodwell, Henry, English critic and theological writer: b. Dublin 1641; d. 1711. In 1688 he was chosen Camden professor of history at Oxford. After the revolution, his high-church principles inducing him to espouse the cause of the non-jurors, he was deprived of his office. He produced a multitude of works relating to theological and classical literature. Of these the most valuable is entitled 'De Veteribus Græcorum, Romanorumque Cyclis, Dissertationes X., cum Tabulis Necessariis.'

Doe, John, and **Richard Roe,** two fictitious personages in law who formerly appeared in a suit of ejectment. The former was the plaintiff and the latter the defendant. The fiction on which their appearance was based was abolished by the Common Law Procedure Act, and now accordingly they do not appear in England. In American usage, attempts have been made to substitute other names, but in proceedings where the identity of the alleged criminal is not known, or is designedly concealed for any reason, John Doe is the favorite term employed.

Does, doos, Jacob Van Der ("The Elder"), Dutch painter: b. Amsterdam 4 March 1623; d. 17 Nov. 1673. After study with local masters, he lived in France and Italy, painting landscapes of merit, but dark and spiritless in many instances. He had two sons, Jakob and Simon, both painters of note.

Doffer (doff, to put off), a small and slowly revolving cylinder, which strips the cotton or wool from the cards on the main cylinder of a carding machine.

Dog, a mammal of the order *Carnivores*, family *Canidæ*. The origin of the domesticated dog is unknown, but probably it is of composite descent from the jackal, with a certain admixture of wolf indicated, or possibly these have been intermingled with the blood of dog races tamed by men in different parts of the world. When the different tribes and races of men drifted about the earth's surface they took their dogs with them and no doubt breeds were mixed and races exchanged. By naturalists and writers in times gone by, dogs have been divided into groups, but for practical purposes at the present time they are divided into two classes:—sporting dogs and non-sporting dogs. Controversies still rage as to the origin of certain classes of dogs, but almost all hounds that run by scent and the greyhound that runs by sight were of Persian, or at any rate Asiatic origin. The pointer in scientific parlance is the same dog as the hound, and the setter is a large spaniel. The Molossus of the ancient Greeks may be the same as the Thibet mastiff, and progenitor of the Great Dane, boarhounds, mastiffs, and possibly the bulldog.

The main characteristic of the dog is his reliance on man, upon whom he looks as head of the pack. Wild breeds of dogs are the Australian dingo, the Cape hunting dog, the raccoon dog, the Hindoo dhole, and the Venezuelan mountain dog now merged with the Guariquin dog.

In enumerating the breeds we have to deal with at the present day the following comprises the category as met with at the leading dog shows held under the auspices of recognized kennel clubs, or that are used in the ordinary vocations or sports of life:

Non-sporting Dogs	
Mastiff.	Toy Spaniel.
St Bernard.	Japanese Spaniel.
Newfoundland.	Maltese.
Collie.	Pomeranian.
Smooth Collie.	Italian Greyhound.
Bobtail Sheepdog.	Schipperke.
Poodle.	Chow Chow.
Dalmatian.	Chihuahua.
Bulldog.	Bull Terrier.
Pug.	Boston Terrier.
Sporting Dogs	
Bloodhound.	Irish Water Spaniel.
Foxhound.	Clumber Spaniel.
Staghound.	Sussex Spaniel.
Harrier.	Black Field Spaniel.
Beagle.	Norfolk Spaniel.
Otterhound.	Cocker Spaniel.
Deerhound.	Bassetthound.
Greyhound.	Dachshund.
Whippet.	Fox Terrier.
Great Dane.	Scottish Terrier.
Wolfhound.	Skye Terrier.
Borzoi (Russian Wolfhound).	Irish Terrier.
Pointer.	Welsh Terrier.
Setter.	Dandie Dinmont.
Retriever.	Airedale.
	Bedlington.

The interests of the dog and its betterment in breed and those qualities that make the animal valuable are looked after by clubs and associations principally in the United States, England, France, Germany, Austria, Russia, Italy, Australia, and South Africa, in which countries official shows are held at stated times and the rules governing these organizations are recognized so far as breeds are concerned by these governments. A large number of illustrated magazines and journals in all parts of the world are devoted to the interests of the canine race. The principal ones in England are: 'Our Dogs'; 'Stock-keeper'; 'Illustrated Kennel News'; and 'The Field'; in the United States: 'Rider and Driver'; 'Field and Fancy'; 'Dog Fancier'; 'The Kennel'; 'The Sportsman's Review'; 'Stock-keeper'; 'The Field'; and 'The Dog.'

Bloodhound.—In general appearance this noble animal impresses one as the most dignified of any dog. The head is long and clean with tremendous wrinkles and pendulous ears, the eye is small and deeply set, and shows much of the haw. The old fallacy of bloodhounds being ferocious is absurd; they hunt or trail persons by scent and on finding their quarry do

1. Smooth Fox Terrier.
2. Clumber Spaniel.
3. Basset Hound.
4. French Bulldog.
5. English Bulldog.
6. Pomeranian.
7. Pug.
8. Boston Terrier.

not attack, but stand baying until the pursuers arrive.

Standard.— Skull long, narrow, and very much peaked; muzzle deep and square; ears set on very low, thin, and hanging in graceful folds close to the face; deep-set eyes, with triangular lids showing the red haw; flews long, thin, and pendulous, the upper lip overhanging the lower one; neck long, with profuse dewlap; skin of face very loose and wrinkled; coat close; skin thin; shoulders deep and sloping; brisket well let down; loins broad and muscular; powerful thighs and second thighs; good legs; round feet; hocks well bent; tapering stern. Colors: black and tan, red and tan, and tawny.

St. Bernard.— This magnificent dog takes its name from the monastery of Mt. St. Bernard, Switzerland, and is remarkable for its high order of intelligence. It was used by the monks for rescuing travelers lost in the snow. The old type which was small and somewhat plain in head is fast dying out, the present show specimens being more on the mastiff type of head.

Standard.— Head very massive and large, showing great depth from eye to lower jaw; face rather short, muzzle wide, deep, and cut off square; lips hanging down well and rather loose, the stop well defined, but not too abrupt; skull massive and well rounded; eyes dark in color, of medium size, rather deeply set, the lower eyelid drooping slightly, so as to show a little of the red haw; ears rather small, lying well to the cheek, and very slightly feathered in the rough variety; nose black in color, wide, and deep, legs straight, with great bone and muscle; hocks and stifle well bent; feet large and compact; body rather long, broad, straight, and ribs well rounded. The coat of the smooth- or short-coated variety should be very close, thick, and slightly broken-haired. In the rough variety the coat should be dense and flat, of medium length, not woolly, rather long on the neck, thighs, and tail. Color and markings: orange, orange-tawny, and all shades of brindle and red. The markings should be as follows: White muzzle, white blaze on face, shaded with black, black shadings on the ears, white collar round neck, and white on chest, legs, and tip of tail. The body may be white with patches of any of the above colors.

Great Dane.— This dog is a most symmetrical animal, and the embodiment of agility and strength. They were originally used in Denmark and Germany for boar and deer hunting. They make ideal watch dogs.

Standard.— Head, which should be carried high, long and not too broad; muzzle broad, strong, and blunt; eyes small, with sharp expression; neck long and arched, free from dewlap; chest moderately broad; brisket deep; loin slightly arched; shoulders sloping; elbows well under; belly well drawn up; legs straight and muscular; second thighs long and strong; feet large, well arched, and close; coat hard and dense; tail strong at root, and ending fine, carried rather low. Colors: brindle, fawn, harlequin, black, white, and blue.

Mastiff.— In this old breed we have probably the most massive and ferocious looking of dogs.

Standard.— Head large and massive; skull flatly rounded; ears small; muzzle square, deep and broad; teeth level; eyes brown or hazel-colored, and wide apart; front legs straight, with great bone; chest deep; loins strong and large as possible; color, brindle or fawn; in both cases muzzle and ears black; size as large as possible, so long as symmetry is retained.

Newfoundland.— This noble dog is famed for his remarkable fearlessness of water and the readiness with which it will risk its life to save human beings from drowning. The black dog, which is spoken of as the true Newfoundland, is a trifle larger than the Landseer type, which is a black and white dog. Much controversy has taken place as to whence white markings came, some claiming a spaniel cross.

Standard.— Head broad and massive with flat skull and somewhat square muzzle; ears small and lying close to the head; coat straight and dense and capable of resisting water; tail carried gaily, but not curled over; color black, black and white, or bronze; average weight, 100 pounds for dogs and 85 pounds for bitches.

Pointer.— That this breed was descended from the hound was first clearly indicated by Youatt. The disposition to point appears to be due to training, and although other dogs have been taught to point, in no case do they assume the same rigid position so notable in the pointer. This breed is marked by a compact and well knit body, sloping shoulders, muscular limbs, and beautiful action. The head is large and flat, stop well defined with a depression running from the top to occiput, muzzle long and square, with not too much lip. Colors are white with black, liver, and orange markings, and solid black and liver.

Greyhound.— The English greyhound, which is of great antiquity, has been regarded by some as the ancestral stock of the majority of our domestic dogs, but this is doubtful. It is easily distinguished at a glance from all other dogs by its graceful outline and large size. Greyhounds hunt entirely by sight instead of scent.

Standard.— Head long and lean, rather wide between the eyes and flat at the top; jaw powerful, but cleanly cut; teeth level and white; eyes bright; ears small and fine in texture and rose-shaped; neck long and muscular, elegantly arched, and free from throatiness; shoulders oblique and muscular; chest deep and capacious; back broad and square, rather long and slightly arched over loins which should be strong and powerful; forelegs rather long and set under dog, possessing fair amount of bone; hind quarters strong and broad across, stifles well bent, thighs broad and muscular, hocks well let down; feet round, well split up with strong soles; tail long, tapering, and nicely carried; coat fine and close; color, black, red, white, brindle, fawn, blue, and the various mixtures of each.

Whippet.— This breed is the result of a cross between a greyhound and a terrier, and is bred especially for rabbit coursing and racing. In the latter sport these dogs are without doubt the most speedy animals known, even exceeding the speed of the racehorse for a short distance. In outline they are identically the same as the greyhound.

Staghound.— It is a large hound, white in color with black and tan markings; the head somewhat on the pointer type, but the ears more pendulous and set lower. This breed has been used for many years in Europe for stag hunting.

Deerhound.— The Scotch deerhound is larger and more massive than the English greyhound, frequently standing as high as 28 to 30

inches at the shoulder, the body being clothed with a rough coat. Its principal use is for deer-stalking in the Highlands.

Standard.— Head long and narrow, tapering gradually from the ears; nose black (occasionally blue) and pointed; lips level; ears small, set high, carried in a fold, soft and silky, and free from long hair; neck long, but strong, with the nape or crest very prominent; shoulders sloping; toes close and arched; chest deep; body long, but well ribbed up; loins arched with great breadth across hips; stifle well rounded; thighs long; tail set on low, curved but not curled; coat rough and harsh on body; mane on neck and slight fringe on inside legs, on thighs and on tail. Colors: All shades from dark blue or black brindle to light gray brindle, yellow, fawn, dun, and drab; white markings objectionable, but very often to be found on chest and toes.

Irish Wolfhound.— This ancient breed was famous for many years in Ireland for its great power and strength and its prowess against wolves. It has practically the same lines as the deerhound only more massive in skull and body. The colors are the same.

Borzoi or Russian Wolfhound.— Is of rather larger build than his English cousin, being covered with a wavy silky coat quite different in texture from that of the deerhound and wolfhound; the head is more domed and muzzle of the Roman nose type. It is used in Russia for hunting wolves. Colors are white with drab, fawn, or brindle markings.

Italian Greyhound.— This breed is kept purely as pets and may be regarded as a miniature greyhound. The eyes are much larger and more prominent than in the large greyhound. There are several colors, among which are a golden fawn and a mouse fawn, the most valuable colors; white markings are undesirable.

English Foxhound.—The modern foxhound is somewhat smaller than the staghound and cobbier in body; the head is cleaner with more substance in the muzzle; the ears are rounded and placed much higher on the skull. The American foxhound is much the same type, but somewhat smaller and lighter built, the colors often being black and tan, showing a bloodhound cross.

Beagle.— This term is generally applied to any hound standing less than 15 inches high, although the true pure breed beagle is a distinct breed, which may be regarded as a miniature foxhound with the exception of the ears, which are more pendulous; the height varies from 9 to 15 inches. The beagle has a musical note and an acute scent as well as great perseverance in following a trail.

Setters.— The various breeds known as setters are practically large spaniels which acquired this name from being taught to crouch when marking their game.

English Setter.— It is regarded as a result of a cross between the field spaniel and the pointer, and should have a soft coat with a slight wave, but no curl in the hair. There is a great variation in color, which is valued according to the following scale: black and white ticked with large splashes, or the Blue Belton; then orange and white freckled, known as the "Orange Belton"; black and white with tan markings; and black and white.

Standard.— Head long and lean with a flat skull; muzzle long and deep; lips not too pendulous; ears of moderate size, fine in texture, set on bone, and well back; neck long, muscular, and well set in sloping, deep shoulders; chest narrow, but deep, and ribs well sprung; loins muscular and slightly arched, with powerful hind quarters; front legs perfectly straight, and feet small and firm; toes arched and close together.

Irish Setter.— Of a deep-red mahogany color, this dog is rather lighter in build than the English setter, with a narrow and slightly domed head.

The Gordon or black and tan setter is much heavier than either the English or Irish breeds, this heaviness being especially shown in the head, which is broader and deeper. The body should be massive and black with tan markings.

Retriever.— This name applies to a large dog somewhat on the order of the setter, employed for retrieving game. They have more or less Newfoundland blood in them and trace their parentage to the water spaniel or setter. The curly-coated retriever, which may be either black or liver color, is the product of a cross between the smaller black Newfoundland and the Irish water spaniel. It is characterized by the short hair of the face and the tail devoid of any fringe, although covered to within a few inches of its extremity with short, crispy curls. The hair on the body is closely and crisply curled, hence the old phrase of the "nigger-coated retriever," a term used in some counties in England. The wavy or flat-coated retriever has the same outline, with the exception of the coat, which is flat and wavy, and is close to the body.

Chesapeake Bay Dog.— As the name signifies, this dog is a native of Chesapeake Bay. It resembles a dull-colored red retriever both in color, shape, and size. The coat is extremely dense and absolutely waterproof. For general retrieving work in the water we know of no dog which can equal it. It has been known to work the whole day in the ice and never seems to tire.

Sporting Spaniel.— The Clumber spaniel derives its name from Clumber Park, the estate of the Duke of Newcastle, where this breed has been kept for many generations. The Clumber is distinguished by its silence when hunting, and is a large, low, heavy, massive dog, with immense bone.

Standard.— Large, low, heavy, and massive throughout, with immense bone; head large, with largely developed forehead; brows heavy and eyes deeply set; muzzle long and very square, with a fair quantity of lip; ears small when compared with the size of the dog, and well shaped, hanging close to the face. Color is white with lemon markings.

Field or Black Spaniel.— It is somewhat on the Clumber style, but has much more activity, a longer muzzle and cleaner head.

Standard.— Head long and lean, with a good length of muzzle, which must not be snippy; a short, coarse, or clumpy head is objectionable; eyes dark; ears very low down, narrow where they leave the head, long and lobe-shaped; body large, deep, long, and low; tail carried below the level of the back; legs straight, strong, short, and very large in bone. Although a long, low dog, he must be active, with plenty of life, and any resemblance in shape, action, or movement to the bassetthound or dachshund should be discarded.

1. English Setter.
2. Greyhound.
3. Irish Terrier.
4. Great Dane.
5. Poodle.
6. Bull Terrier.
7. Russian Wolfhound.
8. Collie.

Cocker Spaniel.— The weight of this variety of spaniel at exhibitions is usually under 26 pounds. The head is long and narrow, but not quite so lean or long as the field spaniel, the muzzle well developed and not snippy; eyes dark, and although not full or prominent, a little larger in comparison with the size of the dog than the eye of the field spaniel; ears long, and small near the head, set low, and lobe-shaped; body large, deep, and round throughout, and in length much shorter than in the field spaniel; stern set low; legs powerful and straight, and a little longer than the field spaniel; and coat flat and abundant, but not too long; and with plenty of feather. It should be remembered that, although a small spaniel, the cocker is a sportsman's dog, and any trace in shape, make, expression, or action of the toy spaniel should be discarded.

Irish Water Spaniel.— This quaint animal is possibly the most useful all-around worker of the whole group of spaniels. The general appearance is that of a big upstanding shaggy liver-colored dog with a strong head and a distinct top-knot, a well furnished cobby body, and a rat-like tail. These dogs are especially fond of the water and good on all retrieving work.

Dalmatian.— The Dalmatian or coach dog is probably allied to the pointer. It is distinguished by the spots which are black or liver, on a white ground. Its use in England and America is essentially as a carriage dog, and it devotes itself entirely to the horse, often sleeping in the same stall. In its native country the Dalmatian is used as a pointer and is said to be staunch on game.

Standard.— Head longish, skull flat, moderate amount of stop; muzzle long and powerful; eyes medium size, and dark or light according to markings; neck fairly long and arched, no throatiness; chest very deep, not wide under; feet compact, well padded; tail smooth, slightly curved upward; coat short, hard, dense; ground color pure white; spots pure black or liver color; very decided, not intermixed; ears and tail well spotted; weight 50 pounds. The general appearance is that of a pointer.

Sheep Dog.— The Collie is essentially of Scotch origin. In appearance it is one of the most handsome of the canine race, having a well-knit frame, chest deep, but not wide; fore legs straight, hocks well bent, feet compact and strong. The head should be long, fairly narrow, and flat; ears small, set well back on the head, and carried semi-erect, but not pricked. Colors are black and tan, black, tan and white, sable, and sable and white.

Smooth Collie.— Is practically on the same lines as the rough collie, with the exception of the coat, which is smooth and lies very close, and the eyes, which, in many cases, are china or wall-eyed, that is of a whitish color.

Old English (Bobtail) Sheep Dog.— This quaint old breed is quite different in type from the other sheep dog, having a short, wide skull and very massive body, which is covered with a rough, shaggy coat, with an abrupt, or bob-tail, hence the name. Is much used in England by the drovers and is locally known as the drover's dog.

Standard.— Color, any shade of blue, blue merle or grizzle, with white on face or legs for relief; head big and square; eyes small and dark; in very light-colored dogs wall or marble; square in body and as large as possible, with a broken, harsh, wavy coat; ears small and neatly set on side of head.

Bearded Collie.— Is practically a repetition of the bob-tail, with the exception of the tail, which is long and carried low, and the body, which is not quite so short or massive.

Bull-Dog.— This breed is, without doubt, the most maligned of the canine race. In appearance it is that of a low cobby dog, with a very large flat skull, showing much wrinkle, short nose or face and a long, wide turned-up underjaw. In body is low and wide in front, with well sprung ribs and a short roach or wheel back, and a short, tapering tail, which must not be carried above the level of the back. Since the old-time sport of bull-baiting has been done away with the bull-dog has been bred especially as a pet. They are, in no way, fighters, being, without doubt, the most affectionate of all breeds.

Standard.— Thick-set and compact; very heavy in front, and of comparatively lighter build behind; legs short, muscular, and set outside the body, but not exaggerated; shoulders massive, and standing well out; chest wide and deep; skull large; and temples high, with stop well defined; eyes wide apart, and dark in color; underjaw wide, and well turned up; nose large, black, and very short; strong loin, well tucked up; tail short and set on low; colors, all shades of brindle, fawn, white, and all pied colors.

Terrier.— The bull terrier, as its name implies, is a cross between the bulldog and the white English terrier. The general appearance is that of a symmetrical animal, the embodiment of agility, strength, and determination. The ears are cropped, which gives a smart and alert appearance. The popular color is pure white with small black eyes and nose; a cherry or flesh-colored nose is undesirable.

Standard.— Head long, flat, and wide between ears, tapering to nose without cheek muscles, slight indention down face, without a stop; jaws long and very powerful; large black nose, and open nostrils; eyes small and very black; lips meeting as tightly as possible without a fold; teeth regular in shape and meeting exactly, a deviation being a great fault; ears always cropped; neck long, slightly arched, nicely set in shoulders, tapering to head, without any loose skin; shoulders strong, muscular, and slanting; chest wide and deep; ribs well rounded; back, short and muscular; fore legs perfectly straight, with well developed muscles, not "out at shoulder," and very strong in pasterns; hind legs long, muscular, and good strong, straight hocks, well let down; feet like those of a cat; color white; coat short, but close, stiff to the touch, and with fine gloss; tail set on very low, and 10 to 12 inches long, thick where it joins the body, tapering to a fine point, carried without a curl and never over the back.

Airedale Terrier.— This is a large, rough-coated terrier, found chiefly in Yorkshire, England. It derives its name from the river Aire, where it is much used for all hunting purposes. The general appearance is that of a big, rough-coated dog, on the same lines as the Irish terrier, but much stronger and heavier built. The colors are black and tan, and grizzle and tan, and the weight from 40 to 55 pounds. The coat should be short, very dense, and of a harsh texture.

Scottish Terrier.— The general appearance is that of a low cobby rough coated terrier with prick ears. The head should be long and narrow, with small, dark eyes and a long punishing jaw; the front legs straight, and shoulders strong, but not too broad; body short and the tail carried gayly; weight from 14 to 20 pounds; colors, wheaten, red and black brindle, and solid black. White markings are objectionable.

Skye Terrier.— This is, undoubtedly, the old Highland terrier, a long, low dog, with a long, straight coat of dark steel blue, or gray color; head broad and strong, with a long jaw; nose pointed, and eyes small, dark, and set close together; body long and low, but arched at the loins, and tail carried low, and ears pricked or drop, the latter carried low and close to the head.

Dandie Dinmont Terrier.— This game little terrier is also of Northern origin. It is low on the leg and strongly built. The head is apparently large in proportion to size; skull fairly wide and covered with a top-knot of silky, light hair. Colors are pepper or mustard; tail carried gayly above; weight not over 25 pounds.

Bedlington Terrier.— This breed hails from the northeastern counties of England. It is rather long and wiry in appearance, with a bluish, or sand-colored coat. The head is long and narrow, with a silky top-knot, somewhat like the Dandie, but is much narrower in skull. These dogs are exceedingly game and weigh 12 to 18 pounds.

Welsh Terrier.— As the name implies, these little dogs come from Wales. They are, in general appearance, much like the Airedale and of the same color; the head is broader in comparison and eyes set wider apart. The weight should not exceed 20 pounds.

Yorkshire Terrier.— This is a small breed, bred chiefly in the county of Yorkshire, and is easily distinguished by its very long, silky coat, especially on the face, which is parted from the nose down the whole length of the body to the tail. It is exceedingly bright and quite game, but valued chiefly as a pet. The colors are a dark blue body, with tan markings; and black with tan markings. The ears are cropped and carried erect, and the weight is between three and eight pounds.

Maltese Terrier.— This dog is on the same lines as the Yorkshire, but a trifle larger, colored pure white, with a black nose and small, deep-set eyes. The coat should be flat and not curly, which, in many cases, shows a toy poodle cross.

Manchester or Black and Tan Terrier.— A smooth-coated terrier which has been bred for many years in Manchester, England, derives its name thence. The general appearance is that of a smart dog with a black body and rich tan markings on the legs and feet; the division between the colors should be well defined. The ears are cropped or V-shaped. The weight is from 7 to 20 pounds. The toy black and tan is identically the same breed, but does not exceed seven pounds in weight.

Dachshund.— This quaint and very game breed is essentially of German origin. The general appearance is that of a dwarfy short-legged, long-bodied, but sturdy dog, with strongly developed muscles. The head is long and fairly broad, conical in shape, tapering toward the nose, with ears set high and broad and nicely rounded, not pointed or folded. The legs should be short and muscular, but not over at the knees; elbows well under, and shoulders broad and well placed; loin short, firm, and broad; and tail short, but carried gayly. Colors are solid red, black and tan, and dappled. The coat should be smooth and glossy. The rough coated variety, which is now becoming popular, is on the same lines exactly.

Poodle.— This is probably the cleverest of all dogs and most apt to learn tricks. Its colors are a deep black, blue, red, white, or cream. There are two varieties, the corded, which has a long, rope-like coat, and the curly, which should be short and tightly curled like astrakhan. They make ideal companions and can readily be broken to the gun and make grand retrievers.

Fox Terrier.— The fox terrier is probably the most popular of all terriers. It is said to have descended from a cross between the small fox hound and the English terrier. It derives its name from the use of driving foxes from holes or burrows in the ground. The most popular color is a pure white body with black and tan markings on the head, with an even blaize up the face. The head should be flat and narrow, with a strong foreface or muzzle, eyes small, ears likewise small and of V shape, carried forward and close to the head. The body should be short, with well-sprung ribs, narrow in chest, with clean sloping shoulders, perfectly straight front and cat-like feet. The wire-haired dog is identically the same as his smooth brother, with the exception of the coat, which should be rough, with a decided harsh texture. Weight, 15 to 21 pounds.

Irish Terrier.—As the name implies, is of Irish origin and is aptly named the "Dare Devil," being very game. In size it is somewhat larger than the fox terrier, and more racy in body, and has larger feet. Cropping the ears has now gone out of fashion, the modern ear being the same as the fox terrier.

Standard.— Head long, rather narrow, punishing jaw, eyes small and dark, ears fairly small, not set on too high, legs straight and strong, feet round and thick, with good pads; chest narrow, with good depth of brisket, back strong and straight. Color, wheaten and red. Expression wicked but intelligent. Coat short and rough, and very harsh.

Boston Terrier.— This smart little dog is especially of American origin having been raised in Boston and the nearby towns for the past 40 years. It resembles the bull-dog in head, but is void of wrinkle and must not show the teeth; the body should be built on the terrier type, having a narrow front, with strong, but not wide, shoulders, short back, and a short screw or tapering tail. The ears are cropped and carried erect. The three classes by weight are under 15 pounds, under 23 pounds, and not exceeding 32 pounds. Colors are brindle with white markings, fawn and white, or red and white. They are used entirely as pets.

Pugs.— This quaint breed is one of the most popular house pets. In appearance they resemble the bull-dog, having a short, square muzzle and heavily wrinkled head. The ears should hang close to the head and be carried forward; the body be short and round and the tail curled and lie on the back. The colors are a rich apricot fawn with black shadings and a deep black.

Toy Spaniel.— The English toy spaniels are the King Charles, or black and tan, the Blenheim or orange and white, the Prince Charles, and the Red, and are practically all of the same family, distinguished only by the colors. The head should be large and domed, with the ears set very low in the skull; the nose, or face, as short as possible and stop well defined; eyes as large as possible and very prominent; body short and well coated, and small in size. They are essentially house pets.

Japanese Spaniel.— It is black and white, or orange and white. The head is not so large or domed as the English spaniel and the ears are much smaller and carried higher and V-shaped; eyes wide apart and showing a good deal of the white; tail heavily coated and carried over the back. In size it is as small as possible.

Charles G. Hopton,
Kennel Editor of 'Rider and Driver.'

Dog-days (Lat. *caniculæ*), the name applied by the ancients to a period of about 40 days, the hottest season of the year, at the time of the heliacal rising of Sirius, the dog-star; that is, the time when it rose just before the sun. The heat, which is usually most oppressive at this season, was formerly ascribed to the conjunction of this star with the sun. We still retain the expression dog-days, as applied to the hottest season of the year, but owing to the precession of the equinoxes it is no longer the time of the heliacal rising of the dog-star.

Dog-fish, the popular name of several species of small shark (q.v.), chiefly belonging to *Mustelus* and *Squalus*, two quite unlike genera. The name is derived from their habit of swimming in schools or packs in pursuit of their food. In their general anatomy, they differ but little from the other sharks, so well known for their ferocious and savage habits. The dog-fishes, though among the smallest of the tribe, manifest propensities equally cruel with those which have rendered the white shark and others so justly dreaded. Although seldom or never injurious to man, they commit great ravages in the fisheries, and where they abound constitute one of the greatest nuisances to the fishermen. Exceedingly voracious and devouring almost everything which they encounter, the mischief they occasion by taking the baits, and very often the hooks, of the deep-sea lines, is very considerable and not at all compensated for by the flesh of those which are captured.

The smooth dog-fish or dog-shark (*M. canis-nus*) is found on both sides of the North Atlantic, and on the American side is particularly abundant south of Cape Cod. It is about 2 to 3 feet long. No spines occur in the margins of the dorsal fins, and the smooth pavement-like teeth are especially adapted for crushing crabs, lobsters, and other testaceous invertebrates on which they chiefly feed. The young are hatched from the egg in the oviducts of the female (with which, however, they are not connected by a placenta, as in the related *Galeus mustelus* of Europe), and are born alive. The eggs are similar to others of the family, and covered by a tough membranaceous integument. The skin of these fish is beset with numerous small asperities, which render it, when dried, well adapted for polishing wood and for other mechanical purposes.

The spiny dog-fish (*Squalus acanthias*) is very abundant on the coasts of New England, and, although similar in size and general aspect, is readily distinguished from the smooth dog-fish by the presence of a strong spine before each of the two dorsal fins. The eggs are deposited before hatching. This species furnishes material for a valuable fishery and fish industry in Maine, where the oil is extracted from the livers, the flesh ground up for fertilizers or poultry food, and the skin utilized for polishing metal and wood. The dog-fish feeds chiefly on herring and mackerel, the schools of which it follows in immense numbers. Similar species occur in the Pacific Ocean and other seas.

The flesh of all the species is hard, dry, and unpalatable, requiring to be well soaked before it is eaten. In England the dried flesh goes under the name of Folkestone beef. Poisonous effects are at certain times observed in consequence of eating the livers of dog-fish, and some cases are recorded in which the most distressing illness has been occasioned by the practice. The name dog-fish is also applied to several other quite distinct fishes, more particularly to the western mud-fish or bow-fin (*Amia calva*), and to the dog-salmon (*Oncorhynchus keta*).

Dog-grass. See Couch-grass.

Dog Parsley, one of the common names of *Æthusa cynopium*, a poisonous plant of the carrot family, the only species of the genus *Æthusa*, found in America, from Nova Scotia west to Minnesota, and south to New Jersey, having been naturalized from Europe. The fruit bears some resemblance to the fruit of dill and fennel, and is sometimes eaten in mistake for these. The sharp acrid taste marks the difference. Other names are: Fool's parsley, fool's cicely, and dog-poison.

Dog Rose (*Rosa canina*), a plant of the rose family (*Rosaceæ*); known also as the canker rose, wild brier, and referred to by Shakespeare as "canker-blooms." It is a native of Europe and northern Asia. The ripe fruit is sometimes used abroad to make a preserve that is employed in the manufacture of pills. The plant is naturalized in America, and is found along roadsides from Nova Scotia through western New Jersey and eastern Pennsylvania, and particularly abundant in the valley of the Delaware; it is also found in Tennessee.

Dog-salmon, a name given in Alaska to the *Oncorhynchus Gorbuscha*, more commonly known as the hump-backed salmon. This is a species of the widely extended Pacific salmon, which are found on the North American coasts from Alaska to as far south as Oregon or even the Sacramento River.

Dog-star (Sirius), the star that gives their name to the dog-days (q.v.). Sirius is the brightest star in the heavens, and once was thought to exercise a baleful influence upon human affairs. It is now a clear white star in the constellation Canis, though Seneca and Ptolemy describe it as red.

Dog-tooth Spar, a common variety of the mineral calcite (q.v.), so named because of the resemblance of the acute scalenohedrons, of which it is composed, to a dog's tooth.

Dog-tooth Violet, a common but erroneous name for plants of the genus *Erythronium* (q.v.).

Dogbane, the English name of the *Apocynaceæ*, a natural order of perennial herbs, shrubs, vines and, in some tropical genera, trees, nearly all possessing a milky acrid juice. The order includes about 130 genera, and 1,050 species are recognized. They are widely distributed throughout the world, the larger number in the tropical regions. In America at least 4 genera, and 10 or more species are known. The typical genus *apocynum* is represented by the largest number, of which three are called dogbanes, the best known being *A. cannabinum*, Indian hemp (q.v.). The spreading dogbane or honey-bloom (*A. androsæmifolium*), known also as bitter-root, is found in fields and thickets from Anticosti and British Columbia to Georgia, Nebraska, and Arizona. It belongs to the natural order *Apocynaceæ*, many of the plants of which are poisonous, and some of them drastic purgatives. The whole plant yields the acrid milky juice so common in members of the family; the root is intensely bitter and nauseous. It is the most powerful part, and is employed by country physicians instead of ipecacuanha.

Dogberry. See DOG-WOOD.

Doge, dōj (from the Latin *dux*, a leader or duke), formerly the title of the first magistrates in the Italian republics of Venice and Genoa. The first doge of Venice elected for life was Paolo Anafesto, in 697. The doge was first elected by the people, but afterward by the great council. He held his dignity for life. His power was at first almost absolute. He could convoke legislative assemblies, declare war, conclude treaties, take command of the army, appoint military officers and judges, invest bishops, and award ecclesiastical penalties. But this absolute authority became by degrees very limited. The dignity was abolished with the overthrow of the republic in 1797. In rank he was considered only equal to a duke, though the republic of Venice was in dignity equal to a kingdom. In Genoa the office of doge was established in 1339. Here also the doge was at first elected by the people, but the dignity afterward experienced numerous changes both in this and other respects. After the liberation of Genoa from the yoke of France by Andrea Doria the power belonging to this office was more systematically defined. A great and small council were created, and the duration of the office was limited to two years. After the overthrow of Genoa by the French in 1797 the dignity became extinct, although it was revived for a short time between 1802 and 1805. See GENOA; VENICE.

Doge's Palace, The (It. *Palazzo Ducale*), the official residence of the former rulers of Venice, begun in 1350 and finished in 1442. Its variegated walls of marble and its colonnades make it one of the most striking sights of the city. It is famous for its carvings and paintings. The halls of the interior are adorned with works by Titian, Tintoret, Veronese, and other Venetian masters.

Dogger, dōg'gėr (from Dutch "dogger," a codfish), a Dutch vessel equipped with two masts, and somewhat resembling a ketch. It is principally used for fishing in the North Sea, chiefly on the Doggerbank.

Doggerbank, an extensive sand-bank of the North Sea, between England and Denmark. It is celebrated for its cod fishery.

Doggett's Coat and Badge, a prize for a rowing-match on the Thames, which takes place every year on 1 August, the course extending from London Bridge to Cadogan Pier, Chelsea. The first prize is an orange-colored waterman's coat and a silver badge representing the white horse of Hanover, and to this have been added other prizes, the first prize being also augmented. The match is open to six young watermen recently out of their apprenticeship. It was instituted by Thomas Doggett, a native of Dublin, and a popular actor in the early part of the 18th century, who left a bequest for the purpose of founding the prize in commemoration of the accession of George I. (1 Aug. 1715). Dibdin's ballad opera, 'The Waterman,' is based upon this rowing contest.

Dogma, in the theological sense of the word, is a tenet of faith given in the word of God whether written or traditional and proposed by the Church to the belief of the faithful. Primarily the term dogma, being derived from the Greek verb δοκεω, to seem, to appear, meant only opinion; but in the ancient schools of philosophy dogmata (plural) were the doctrines of the several heads of such schools. The disciples of Pythagoras accepted on the authority of The Master, as they styled him emphatically, the tenets he proposed, the sufficient ground of the disciples' belief being that αὐτος ἐφη "He said it." Perhaps the first employment of dogma, dogmata in the now current meaning of the word, is found in a work by St. Ignatius, disciple of St. John the Evangelist, who in an epistle to the Magnesians exhorts them to be "established in the dogmata of the Lord and the apostles." The dogmas of the Roman Catholic Church purport to have been taught by the apostles and to have been by them handed down τῇ τοῦτε or in writing, to their contemporaries and successors, who in turn did and still do the like: that tradition is the foundation of all the Church's articles of belief. The Church has no power to frame new dogmas, and she must to the end of time proclaim the self same dogmas which at any time in her history were authentically set forth as truths of divine revelation. What the Church may do and has done is to define, as occasion may require, the precise meaning of her teachings, bringing out into definite shape what before was not expressed with all necessary fulness or clearness. An example of this is had in the application of the term transubstantiation to signify what the Catholic Church had at all times believed and taught — that the bread and wine are, in the sacrament of the Eucharist, really and substantially changed into Christ's body and blood.

Dogmatics, a systematic arrangement of the articles of Christian faith (dogmas), or the branch of theology that deals with them. The first attempt to furnish a complete and coherent system of Christian dogmas was made by Origen in the 3rd century, who was followed by St. Augustine in the 4th century. Among Protestants, Melanchthon was the first who wrote a compendium of the Christian doctrine.

Dog's-fennel, a plant (*Anthemis cotula*) belonging to the natural order *Compositæ*, and *camomile* genus. It is found in fields and waste places throughout North America, except in the Arctic regions, having been naturalized from Europe. It is known as a weed in Asia, Africa,

and Australia. It deriyes its name of dog's-fennel from the resemblance of its leaf to fennel, and from its bad smell. It has an acrid taste and emetic properties. This plant is also called "stinking May-weed," the scentless May-weed, or wild camomile (*Matricaria inodora*). The name dog's-fennel is sometimes applied in America to a species of the genus *Eupatorium*, hog-weed.

Dogs, Isle of, a peninsula of London extending into the Thames opposite Greenwich. The Millwall docks are on this peninsula. The king's hounds were formerly kept here, hence the name.

Dog's-tail Grass, so called from the resemblance of the spike to a dog's tail. (Lat. *Cynosurus*), a genus of four or five annual and perennial grasses, with flat leaves, native to the north temperate regions of the Old World. One of these grasses has been introduced into this country and is sparingly established. Crested dog's-tail (*Cynosurus cristatus*) is a slender, erect perennial growing from one to two and a half feet high, with narrow leaves and a rather slender, erect, spike-like panicle. It is valuable for lawns, constituting a large proportion of the sward of some of the best bowling greens of England. Its close, compact sod makes it an excellent pasture grass, especially for sheep. Its nutritive value is high, but its yield is low, and its tendency to seed itself in districts where it will grow, to the exclusion of more profitable grasses, and the objection of animals to its wiry flower-stalks, together with the high price of seed, will no doubt restrict its usage by American farmers. It will grow on thin soils, in a humid climate, but prefers a rich moist soil. It grows well in the shade and flowers from June to August. The seeds are small, shining and yellow, and impurities are readily recognized. The mature flower-stalks are valuable, being used in the manufacture of Leghorn hats.

Dog's Tongue, a biennial plant, *Cynoglossum officinale*, belonging to the *Bornaginaceæ*, Borage family. It grows on waste ground and pastures.

Dogtooth, in architecture, an ornamented molding used in early mediæval times in the form of a four-leaved flower, with teeth projecting in the centre; also a steel punch used in working marble.

Dogwatch, on shipboard, a name given to each of two watches of two hours each instead of four, adopted for the purpose of varying the hours of watches kept by each part of the crew during the 24 hours. The watches are arranged thus: 8 to 12 P.M.; 12 to 4 A.M.; 4 to 8 A.M.; 8 to 12 A.M.; 12 to 4 P.M.; 4 to 6 P.M., dogwatch; 6 to 8 P.M., dogwatch; 8 to 12 P.M., and so on.

Dogwood, the common name of the *Cornaceæ*, a natural order of plants, either shrubs or trees, with three or more entire leaves at a node, and polygamous or diœcious flowers in cymes, but sometimes solitary. The fruit is a drupe. The family numbers about 16 genera, and 85 species, most numerous in the northern hemisphere. Of the genera, two are found in America. *Cornus*, the typical genus of the order, has 25 species natives of the northern temperate zone, Mexico, and parts of Peru, 18 of which are found in America. To this genus belong the American shrubs and trees, known as cornel (q.v.), dogwood and kinnikinnik. The other American genus is nyssa (q.v.), which includes the trees called pepperidge, sour-gum, and tupelo. The wood of *C. florida* is smooth, white and fine-grained, and is used for inlaying, and from the bark a febrifuge is made. The southerners who "dip" snuff, use the small branches of the tree to make the brush with which the snuff is applied. The common dogwood of Europe (*C. sanguinea*) is a shrub of remarkable beauty in autumn owing to the deep redness of its foliage. The wood makes the very best charcoal for gunpowder. It is very hard, and is made into skewers, cogs for wheels, etc., and in former times it was in request for making arrows. The small bitter fruit yields as much as one third of its weight of an oil resembling that of olive. The wood of *Rhamnus frangula*, the berry-bearing alder, is also used by gunpowder-makers, and called by them dogwood. Jamaica dogwood (*Piscidia erythrina*) is a papilionaceous timber-tree; the cortex of the root is powerfully narcotic, used for stupefying fish or deadening the pain of toothache.

Dohnanyi, dō-nŏn'yē, **Ernst von,** Hungarian composer: b. Presburg 1877. While a pupil at the Royal Conservatory at Budapest 1894–7 he took several prizes for composition. In 1897 he studied with D'Albert to perfect himself in the technique of the pianoforte previous to touring the chief cities of Austria, Germany, and England. His tours of America in 1900 were successful. His pianoforte concerto in C minor took the Rosendorf prize, Vienna, March 1899. This he played with the Boston Symphony Orchestra.

Dohrn, dōrn, **Anton,** German zoologist: b. Stettin 29 Dec. 1840. He studied at Königsberg, Bonn, Jena, and Berlin, lectured for a time on zoology at Jena, and in 1870 he founded the great zoological station at Naples. As an embryologist he has devoted himself mainly to the development of insects and crustaceans; and besides reports, he has published works on the origin of the vertebrates.

Doit, a small copper coin anciently current in Scotland, and equal in value to one twelfth (according to others, one eighth) of a penny sterling. There was also in lower Germany a small coin called *deut*. In the Netherlands the coin is called *duyt*.

Dolabella, dŏl-ą-bĕl'ą, **Pub'lius Cornel'ius,** Roman leader: b. about 70 B.C.; d. 43 B.C. He married Cicero's daughter Tullia, but treated her so harshly that she was ultimately obliged to leave him. He possessed considerable talents, and at one time stood high in the opinion of Cicero, though there is reason to suppose that Cicero valued him chiefly for the assistance he expected him to give against Cæsar and his party. When disappointed in this expectation his eyes were opened, and he spoke of him with the utmost bitterness and contempt. Dolabella, when about to fall into the hands of his enemies, was slain at his own request by one of his soldiers.

Dolabra, dō-lā'brą, the Latin name for a Celt. See CELTS.

Dolbear, Amos Emerson, American educator and inventor: b. Norwich, Conn., 10 Nov. 1837. He was graduated at Ohio Wesleyan

University in 1860 and has been professor of physics and astronomy in Tufts College since 1874. He has achieved eminence in scientific research, and among his numerous inventions are the writing telegraph (1863), the electric gyroscope (1867), the magnetic telephone (1876), the static telephone (1879), and the air-space telegraph cable (1882). Among his discoveries are the convertibility of sound into electricity (1873), wireless telegraphy (1881), and electric photography (1893). He has received several medals, including a bronze medal for an acoustic apparatus at the Centennial Exposition, Philadelphia, 1876, a silver medal in Paris 1881, and a gold medal in London 1882. Among his published works are: 'Chemical Tables'; 'The Art of Projecting'; 'The Speaking Telephone'; 'Matter, Ether, and Motion'; 'Modes of Motion'; and 'Natural Philosophy.'

Dolce, dōl'- or dōl'chā, or **Dolcemen'te**, in music, an instruction to the performer that the music is to be executed softly and sweetly.

Dolci, dōl'chē, Carlo or **Carlino**, kär-lē' nō, Florentine painter: b. Florence 25 May 1616; d. there 17 Jan. 1680. His works, which consist chiefly of madonnas and saints, exhibit the character attributed to him. The faces are full of a pleasing and tender softness, which, however, is often carried so far as to rob them of all character. Dolci's drawing is generally correct, his coloring exquisitely delicate and transparent, and in the nicety and laborious care of his finish he approaches the most characteristic examples of the Dutch school. His works are numerous and scattered over all Europe. Besides his madonnas his most famous works are his 'St. Cecilia'; 'Christ Blessing the Bread and Wine'; and 'Herodias With the Head of John the Baptist.'

Dol'cinites (from Dolcino, their founder), a Christian sect which arose in Piedmont in 1304. See Apostolic Brethren.

Dol'drums, a nautical term for the parts of the ocean near the equator that abound in calms, squalls, and light baffling winds; otherwise known as the horse-latitudes; also applied to the weather variations characteristic of those regions. See Calms, Region of.

Dole, Charles Fletcher, American Unitarian clergyman: b. Brewer, Me., 17 May 1845. He is a brother of N. H. Dole (q.v.). He has been pastor of the Unitarian Church, Jamaica Plains, Boston, from 1876. He is the author of 'The Citizen and the Neighbor'; 'Jesus and the Men About Him' (1888); 'A Catechism of Liberal Faith' (1895); 'The American Citizen' (1901); 'The Coming People' (1897); 'Noble Womanhood' (1900), etc.

Dole, Nathan Haskell, American writer: b. Chelsea, Mass., 31 Aug. 1852. He was graduated from Harvard 1874, and was literary and musical editor of the Philadelphia *Press* until 1887, when he became literary adviser to the publishing firm of T. Y. Crowell & Company. His principal original works are: 'Young Folks' History of Russia' (1881); 'A Score of Famous Composers'; 'Not Angels Quite'; 'On the Point' (1894); 'The Hawthorn Tree' (1895); 'The Mistakes We Make' (1898); and 'Omar, the Tent-Maker' (1898). In 1899 he edited the complete works of Count Tolstoi, whose novels, 'Anna Karenina,' 'War and Peace,' and many others he had already translated. He has also translated 'Maria y Maria,' 'Maximina,' and 'Sister St. Sulpice,' from the Spanish of Valdes, as well as various works from the French and German. In 1900 he edited a multivariorum edition of the 'Rubaiyat of Omar Khayyam,' containing many translations in English, French, German, Italian, Hungarian, and Danish carefully collated.

Dole, Sanford Ballard, Hawaiian politician: b. Honolulu, Hawaii, 23 April 1844. He studied law in Boston and was admitted to the bar in 1873, returning in the same year to Hawaii. In 1884 he was made a member of the legislature and again in 1886. He had been, in 1887, appointed an associate judge of the supreme court, under the monarchy, which post he resigned to accept the leadership of the revolution that overturned the monarchy in January, 1893, and established a provisional government. On 4 July 1893 a republic was formally proclaimed, of which he was elected president. After the annexation of Hawaii in 1898 he was appointed governor of the islands.

Dôle, dōl, France, town in the department of Jura, 26 miles southeast of Dijon. The manufactures are Prussian blue, hosiery, ironware, leather, vinegar, optical instruments, etc.; and the trade is chiefly in grain, flour, timber, wine, brandy, coal, iron, mill-stones, and marble. It possesses many ruins of Roman architecture. Pop. 12,750.

Dolerite, dŏl'ĕr īt, the name given to a class of rocks, including dolerite proper, basalt, and a few others. Dolerite itself consists of Labrador felspar and augite, with some titaniferous magnetic iron ore, and other minerals. It has a dark-gray color, crystalline, and small-grained, sometimes porphyroidal. Its specific gravity is 3. Its average composition is silica 50, alumina 15, oxide of iron 15, lime 10, magnesia 5, and the rest potash, soda, and water. It is found in great mountain masses, in beds and veins, in the Rhine district, in Iceland, in Guadaloupe, and other places.

Dolet, dō'lā", **Etienne**, a well-known French scholar and martyr: b. Orleans, France, 1509; d. Paris 3 Aug. 1546. At the age of 12 Dolet went to the University of Paris, where his attention was directed to the study which became the chief interest of his life — the writings of Cicero. In 1544, he was found guilty of heresy on a charge mainly based on an alleged mistranslation of Plato, in which he was accused of denying the immortality of the soul. After two years' imprisonment, Dolet was burned in the Palace Maubert, Paris. See Boulmier, 'Etudes sur le XVIème siècle: Etienne Dolet' (1875); Christie, 'Étienne Dolet, the Martyr of the Renaissance' (1899).

Dolgoruky, dōl gō roo'kē, **Katharina Michailow'na, Princess**, the favorite of the Czar, Alexander II., who married her in July 1880 after the death of his first wife, Marie. After the czar's death she lived abroad, and published in Geneva in 1882, under the pseudonym of Victor Laferté, 'Alexander II., Unedited Details of His Private Life and His Death.'

Dolichocephalic, dŏl"ĭ-kō-se-fāl'ik (from Gr. δολιχός long, κεφαλή a head); long-headed: a term used in ethnology to denote those skulls in which the diameter from side to side is

less in proportion to the longitudinal diameter (that is, from front to back) than 8 to 10. This form of skull is seen in an exaggerated form in native Australians and West Africans. The dolichocephalic skull of ordinary type appears among Indo-European races.

Dolichopodidæ, dol″ĭ-kō-pŏd′ĭ-dē, a numerous family of the order *Diptera*. They are small, metallic blue or green flies with slender legs and active habits. The larvæ live in the ground or in decomposing matter. They are not known to be harmful, but the flies are predaceous, and by this habit are beneficial to agriculture, catching, as they do, insects, and even worms, that are injurious to growing crops.

Dol'ichos (Gr. δολιχός long, that is, in pods), a genus of tropical herbs and shrubby plants of the natural order *Leguminosæ*. The 40 or 50 species, of which few are cultivated, are separated from species of the related genus *Phaseolus* by technical characters. The best known species are *D. lablab,* the hyacinth bean, a native of the tropics. It often twines around supports to a height of 20 feet, bears broad, often wrinkled leaves, purple, rather large flowers in erect, axillary racemes, and flat, rather smooth pods containing several small, black seeds. It is an annual, frequently planted in sunny situations to form temporary screens and arbor covers. It succeeds well in any good garden soil, but attains the greatest growth and bears the most foliage upon rich soils. It has several horticultural varieties. *D. sesquipedalis,* the French half-a-yard-long or asparagus bean, a native of South America, is cultivated for its green pods and mature seeds, which are used as esculents. The plant is an annual, twining or rambling plant, with rather large leaves and flowers and very long pods containing numerous small, oblong, usually reddish seeds. The pods sometimes exceed two feet in length and are sometimes curiously twisted. Several other species are used in Asia for food, but the two mentioned are the only ones of importance in the United States. See Soy Bean.

Doll, a favorite plaything of children, found in variety of form and decoration. Most of the dolls found in the stores are made in the village of Sonneberg, in the Thuringian forest, Germany. Here the industry of making children's toys can be traced back to the 17th century. Other villages in this vicinity and some towns in France and Switzerland also export large quantities of dolls to England and the United States. There are about 40 doll manufacturers in London who make dolls of a superior kind. In France expensive life-size dolls are manufactured. There are a number of doll factories in the United States, where of late years "doll shows," or bazaars, have been very popular. The phonograph doll, invented by Edison, created great interest when it was first introduced.

Dollar (Low German *daler,* from *thaler,* short for *Joachimsthaler,* coined 1519 from silver mines in Joachimsthal, Bohemia, and standard for weight and purity), the unit of American currency. The West India trade before the Revolution had made the Spanish dollar, more convenient than the sovereign, the real unit of trade here; and the Coinage Act of 2 April 1792, merely legalized this fact, establishing the dollar as the unit of American currency, making it equivalent to 24.75 grains of fine gold, and authorizing the coinage of silver dollars "of the value of a Spanish milled dollar the same as is now current" (see also Cent), and of halves and quarters correspondent. The first actual coinage was in 1794, dollars of 416 gr., 371.25 silver, .8924 fine. The dollar of account was rated at 4s. 6d. sterling, making the pound equal to $4.44; which, as the sovereign was 113 gr. gold, was too little, and should have been $4.565. By act of 28 June 1834, the gold in the dollar was reduced to 23.20 gr., raised 18 Jan. 1837, to 23.22, where it remains, the pound having been unchanged, has since been equal to $4.86⅔. The last act made the weight of the silver dollar 412.5 gr., but raised it to 900 fine, the amount of silver remaining the same as before, 371.25 gr. On 3 March 1849, a coinage of gold dollars was authorized, weight 25.8 gr., .900 fine, 23.22 gr. pure gold; on 21 Feb. 1853, a $3 gold piece, same fineness, 77.4 gr.; and half and quarter dollars of silver, 192 and 96 gr. respectively, but legal tender only to $5. The act of 1873 discontinued the coinage of the silver dollar of 412.5 gr., but authorized one of 420 gr. (the "trade dollar") for the China and Japan trade. The fall in silver shortly after, however, (at this time the silver dollar was worth rather more than the gold), inflated its value and made bullion owners anxious to have their metal coined into these, and on 22 July 1876, their coinage was limited to the actual demand for export, they not being intended for internal circulation — 35,959,360 were issued in all. The coinage was suspended April 1878. The act of 28 Feb. 1878, revived the coinage of the dollar of 412½ gr., and that of 14 July 1890, continued it. It is notable that many times more silver dollars have been coined since 1873 than before; up to 30 June 1872, the total number struck was only 8,045,838, while that of gold dollars was 19,015,642. The act of 14 March 1900 makes the gold dollar the standard of value in the United States.

Dollar-fish, a name used, particularly in Maine, for a small fish of the family *Stromateidæ,* more widely known as the butter fish or harvest fish (*Rhombus triacanthus*). It is found on the entire extent of the Atlantic coast of the United States, and is extremely abundant during the summer on the shores of the New England and Middle States. The dollar-fish is from 8 to 10 inches long, of an oval form, with a blunt snout and small mouth; the color is silvery, bluish above, beautifully iridescent when alive. Great numbers are captured in seines and pound nets and they are highly valued as pan-fish. The young have an interesting habit of swimming, several together, in the company of large jellyfishes, beneath the disks of which they seek shelter and protection. Several allied species occur on both the east and west coasts of the United States.

Dollart, dŏl′lärt, **The,** a gulf of the North Sea, at the mouth of the Ems, between the Dutch province of Groningen and the Prussian province of Hanover. It was formed by inundations of the sea, which took place in 1277 and subsequently, overwhelming many large villages and hamlets, and destroying thousands of human beings, besides much valuable property. A

considerable extent of rich land has been reclaimed by embankment.

Döllinger, del'ling-er, John Joseph Ignatius, German theologian and historian: b. Bamberg, Bavaria, 28 Feb. 1799; d. 12 Jan. 1890. He studied at Wurzburg, took priest's orders in the Roman Catholic Church in 1822; taught for several years in the Lyceum at Aschaffenburg, and in 1826 was appointed professor of ecclesiastical history and law in the University of Munich. He held this position until 1871, when he was elected rector of the university. His connection with politics began in 1845, when he represented his university in the Bavarian chamber, and in 1848 he was elected to the Frankfort parliament by a Bavarian constituency. In the early part of his career Dollinger was the zealous leader of the Ultramontane party in Germany, and his learning as well as his faith found expression in his 'Treatise on the History of the Church' (1838); 'The Reformation, its Interior Development and its Effects' (1846–8); and 'Luther' (1851). In 1857 he visited Rome, and soon afterward it became evident that his views had undergone a change. Public announcement of this was made in a course of lectures which he delivered at Munich, in which he declared the temporal power of the Pope not an essential part of the Roman Catholic Church, and he expounded this position in a treatise on 'The Church and the Churches' (1861). This attitude of opposition became more pronounced in 1870, when he declined to accept the doctrine of papal infallibility formulated by the Vatican Council, and assumed the leadership of the Old Catholic party. As a result Dollinger was excommunicated by the Archbishop of Munich, but still retained the support of the Bavarian government. In 1874 he presided over a conference of Old Catholics at Bonn, and here he declared that he did not hold himself bound by the decisions of the Council of Trent. In his latter years Döllinger's activity as an author was shown in his 'Materials for a Life of Bellarmin' (1887), and two volumes of 'University Lectures' (1888–9). See Kobell, 'Ignaz von Döllinger, Erinnerung' (1891); 'Life,' by Friedrich (1899–1901). See Old Catholics.

Dol'liver, Jonathan Perkins, American lawyer and politician: b. near Kingwood, Preston County, W. Va., 6 Feb. 1858. He was graduated at West Virginia University 1875 and admitted to the bar 1878. He practised law in Iowa and was a member of Congress from that State for several successive terms. He was appointed United States senator to fill a vacancy and was elected in 1903 for the term ending 1909.

Dollman, John Charles, English artist: b. Hove, 6 May 1851. He was educated in the Royal Academy Art Schools and received a bronze medal at the Paris Exhibition in 1900. Among his works may be named: 'Not Worth Powder and Shot'; 'Warranted Quiet to Ride or Drive'; 'Judas'; 'Gold'; 'Temptation of St. Anthony'; 'Kismet.'

Dollond, John, English optician of French descent: b. London 10 June 1706; d. there 30 Nov. 1761. He devoted his attention to the improvement of refracting telescopes, and succeeded in constructing object-glasses in which the dispersion of the rays of light was corrected. Subsequent members of his family have distinguished themselves in optics, astronomy, etc.

Doll's House, The, one of the best known plays of Henrik Ibsen, published in 1879. It pictures woman as a doll, from whom nature has removed the unused faculties which produce clear thinking and business-like action. Nora, the doll in question, is sweet, childish, ignorant. For the sake of her husband she forges her rich father's name without realizing her guilt. Disclosure of her act brings her face to face with the realities of life, and she leaves her husband's house. An English version of the play was produced in London in 1889.

Dolly Varden, the soft-hearted, wily little coquette in Dickens' novel 'Barnaby Rudge.' The impression made by the author's description of her dress of flower-sprinkled dimity led to the adoption of a style of dress that is known as the Dolly Varden. The name is often applied to any light dress-goods with bright-colored flower effects.

Dolly Varden Trout, the common brook trout (*Salvelinus malma*), of western North America, so called because of the beauty of its markings, which are said to resemble the coloring of a Dolly Varden (q.v.) dress. The trout often attains a weight of 12 pounds. In the region of its native waters it is known as the bull-trout, red-spotted trout, and malma. It has been used to stock streams in the northeastern States, Canada, and Europe.

Dol'man, a long robe worn by the Turks as an upper garment. It is open in front, and has narrow sleeves buttoned at the wrist. It has given its name to a kind of loose jacket worn by women as an outer garment. It has a cape or hanging piece over the arm instead of a sleeve.

Dol'men, a structure consisting of one large unhewn stone, resting on two or more unhewn stones, placed erect in the earth. The name is sometimes used as equivalent to cromlech, sometimes in a distinctive sense. Sir John Lubbock maintains that cromlech should be applied to a stone circle, dolmen to a stone chamber, such circle or chamber consisting of huge stones set up often in prehistoric times for religious or sepulchral purposes or as memorials of some important event.

Dolnja Tuzla, dōl'nyä tooz'lä, Bosnia, town about 20 miles from the Servian frontier Pop. 10,227.

Dolomieu, Déodat Guy Silvain Tancrède Gratet de, dā-ō-da gē sīl-vāñ tāñ krād grä-tā dė do-lo-mē-ė, French geologist and mineralogist: b. Dolomieu (Isère) 24 June 1750; d. Chateauneuf, France, 26 Nov. 1801. He was appointed correspondent of the Academy of Sciences of Paris, and from 1777 to 1791 made extensive travels in the south of Europe, often on foot, with a hammer in his hand and a bag on his back. In 1796 he was appointed professor or lecturer in the School of Mines, and on the establishment of the Institute was made a member of that society. In 1801 he received the professorship of mineralogy in the museum of natural history. Among the works left by him are 'Voyages aux Iles de Lipari' (1783); 'Sur le Tremblement de Terre de la Calabre' (1784); 'Philosophie Minéralogique' (1802).

Dol'omite, carbonate of calcium and magnesium ($CaMgCO_3$) containing normally 30.4 parts lime and 21.7 parts magnesia, but varying in the ratio of the two carbonates. Iron and manganese carbonates are sometimes present as impurities. The crystallization is rhombohedral; the hardness 3.5 to 4; specific gravity 2.8. The color is normally white but may be reddish, grayish, brownish, or even black. In general the mineral resembles calcite but differs in not effervescing freely with cold acid, even if finely powdered. Massive dolomite in the form of dolomitic limestone is a rock of common occurrence and sometimes forms strata of great extent and thickness. Such limestones frequently show all transitions from nearly pure calcite to true dolomite. Generally, a limestone containing over 5 per cent MgO is described as a magnesian limestone. Under pressure dolomitic limestones and dolomites become crystalline and are classified as marbles. Many of the great limestone formations in the United States are more or less dolomitic. See DOLOMITIZATION; LIMESTONE; ROCKS.

Dolomite Mountains, or Dolomite Alps, a group of mountains, part in Tyrol and part in Italy. The name comes from the mineral dolomite, found in large quantities in these mountains.

Dolomitiza'tion, the process by which the calcium in limestones is replaced by magnesium, forming dolomitic limestones and dolomites. The exact nature of this process is still a matter of doubt. Dolomites cannot be formed directly from the calcareous remains of animals, since they contain a much larger proportion of magnesia than any animal shells or tests, and the magnesium therefore was probably added after the calcareous material had accumulated. In the lagoons of coral reefs, the enclosed body of sea water becomes concentrated by evaporation, and the chloride of magnesium (present in all sea water) by a process of double decomposition forms magnesium carbonate from the calcium carbonate of the coral rocks. It is also possible that fine calcareous mud in suspension in sea water may exchange some of its calcium directly for magnesium. See DOLOMITE.

Dolores, dō-lō'rĕs, El Grito de, literally, "The cry, or outcry, of Dolores," marking the commencement of the Mexican war for independence. On the night of 16 Sept. 1810, Don Miguel Hidalgo y Costilla, the parish priest of the town of Dolores (q.v.), gathered a number of patriots under his banner to the cry of: "Long live religion! Long live our Most Holy Mother of Guadalupe! Long live America, and death to bad government!" All previous attempts (1798–1810) to rebel against the Spanish authorities had been suppressed; but Hidalgo and his enthusiastic followers were victorious in several engagements. Although he and his lieutenants, Allende, Aldama, and Jimenez, were captured and put to death in 1811, the movement they began was carried on until the revolutionists triumphed, 27 Sept. 1821, Yturbide entering the capital on that day. See MEXICO.

Dolores Hidalgo, ē-dāl'gō, Mexico, a town in the state of Guanajuato, department of Allende, about 41 miles from the capital of the state, which is also called Guanajuato. Pop. 6,000.

Dolph, John Henry, American painter: b. Fort Ann, N. Y., 18 April 1835; d. New York, 28 Sept. 1903. He studied at Antwerp, and in Paris, then opened a studio in New York; he was a member of the National Academy. His works include: 'Knickerbocker Farm Yard'; 'Season of Plenty'; 'Horse Doctor'; 'A June Day'; 'Who Will Bell the Cat'; 'Cat and Kittens'; 'A Princess'; 'Fish Commissioners'; 'Alexander and Diogenes'; 'The Waste Basket'; 'A Society Lion'; and 'Called to Order.' His pictures of animals, and particularly cats, are best known.

Dolph, Joseph Norton, American statesman: b. Dolphsburg, N. Y., 19 Oct. 1835; d. Portland, Ore., 10 March 1897. He studied law, and began practice at Binghamton, N. Y. In 1862 he settled in Portland, Ore., taking up the practice of law there. In 1864 he was elected city attorney, and was appointed United States district attorney. He was a member of the State Senate four consecutive terms, was elected to the United States Senate in 1883, and re-elected in 1889. In his second term he was chairman of the Committee on Coast Defenses, a member of the Committee on Commerce, and an active opponent of the free coinage of silver.

Dolphin, a group of cetaceans belonging to the family *Delphinidæ*. The common species (*Delphinus delphis*) is found chiefly in the Mediterranean and North Atlantic Ocean. It is from six to eight feet long; the body tapers toward the crescent-shaped tail, which is about a foot broad. The blow-hole is also crescent-shaped; and the beak is usually about six inches long. The dolphin is blackish on the back, and white below, the sides being gray. The female produces but one at a time, and devotes herself assiduously to caring for it. There are numerous species of dolphin, each confined, apparently, to a comparatively narrow range. All are voracious, and feed on other fish and various marine animals, eating, it is said, even the disabled and feeble of their own kind. They live in herds or "schools," and may be seen by ocean voyagers playing about the vessels. They will leap in graceful curves, into the air, make sudden descents into and through the waves, followed by a track of foam. Then they will re-appear, show their slender back-fins, expose their broad tails as they plunge below the water; and almost before one has missed them, they will rise on the other side of the ship. They are a source of pleasure to the ocean traveler; and furnish more substantial gratification to the sailors, who eat their flesh with much relish after their usual rations of salt-pork. The grampus, the porpoise, and many of the so-called whales, such as the white-whale, the killer-whale, and others, are related genera; as are also the soosoo of the Ganges, and the bouto of the Amazon, which inhabit fresh water instead of the ocean. Consult Beddard, 'A Book of Whales' (1900).

Domain', from the Latin *dominium*, right of ownership, property, dominion. The territory over which dominion is exercised; the territory ruled over by a sovereign, or under the government of a commonwealth, as the domains of Great Britain. The term public domain is used in Europe, as property belonging directly to and controlled by the state; such as lands

set apart for state or public uses, roads, canals, parks, etc. In the United States the lands owned by the Federal government or by a State.

Dom'bey and Son, a novel by Charles Dickens, published in 1848. It represents a man of proud and unbending nature who centres his worldly ambitions in an only son, but who becomes broken and subdued by his child's death, family disgrace, and financial ruin.

Domboc, dōm'bōk, or **Doom-book** (A. S. "book of dooms or sentences"), the code of laws compiled by King Alfred, who made few if any original laws, but contented himself with restoring, renovating, and improving those which he found already in existence. Alfred's religious character is strongly impressed on his code, which begins with extracts from the Bible. Then follow the Ten Commandments, the part of the Mosaic law relating to criminal offenses, and passages from the New Testament, including the Golden Rule. The code was ratified by the Witan, as Alfred expressly informs us. Thorpe gives it in his "Diplomatarium Anglicanum ævi Saxonici" ('English Diplomatarium of the Saxon Era') (1865).

Dombrowski, Jan Henryk, yān hĕn'rĭk dōm-brŏf'skē, Polish general: b. Pierszowice near Cracow, 29 Aug. 1755; d. Wina-Gora, Prussia, 6 June 1818. After serving under the Elector of Saxony he returned to take part in the Polish campaigns against Russia and Prussia in 1792–4. Next entering the French service, he organized a Polish legion at Milan; and in the campaigns which followed, Dombrowski and his Poles took a distinguished part. After the fall of Napoleon he returned to Poland and was appointed by the Emperor Alexander a general of cavalry and Polish senator.

Dome. See CUPOLA.

Dome of the Rock, a name given to the Mosque of Omar, Jerusalem. It stands on Mount Moriah, on the site once occupied by the Temple of Solomon. Immediately under its dome is an irregular-shaped rock. This rock was the scene of many scriptural events, and has been greatly revered for ages. See JERUSALEM.

Domenichino, dō"mā-nē-kē'nō, or **Domenico Zampieri,** Italian painter: b. Bologna 28 Oct. 1581; d. Naples 15 April 1641. He was sent to study first with Calvart, and afterward with the Carracci. From the slowness of his execution he was named, by his fellow-students, the "ox of painting"; but Annibal Carracci predicted that the ox would "plough a fruitful field." Having contracted a great friendship for Albano he joined him at Rome, and his former master, Annibal Carracci, jealous of Guido, procured for him the execution of one of the pictures for a Roman Catholic church which had been promised to that great painter. It was a custom with Domenichino to assume, for a time, the passion he was depicting; so that, while working by himself, he was often heard to laugh, weep, and talk aloud, in a manner that would have induced a stranger to suppose him a lunatic. The consequence, however, was, that few painters have surpassed him in lively representation. His 'Communion of St. Jerome' has been considered, by some connoisseurs, inferior only to the 'Transfiguration' of Raphael; and the 'History of Apollo,' which he painted in 10 frescoes for Cardinal Aldobrandini, is also much admired. His merit excited so much envy that he retired to his native city and employed himself two years on his famous picture of the 'Rosary.' He was afterward recalled to Rome (1621) by Gregory XV., who created him his first painter and architect of the Vatican. Losing this post after the Pope's death, he accepted an invitation to Naples, to paint the chapel of St. Januarius. But here he encountered a jealousy so rancorous that his life became altogether embittered by it; and so great was his dread of poison, that he prepared all his eatables with his own hand. Domenichino, who understood every branch of his art, produced nothing excellent without study and labor; but in consequence of his great premeditation, no painter has given his pieces more of the properties belonging to the subject. At the same time his designs are correct; and he succeeded equally in the grand and the tender. Nearly 50 of his pieces have been engraved.

Domestic Animals. See DOMESTICATION.

Domestic Science in Schools, the branch of study that is concerned with household economics as a part of the school curriculum. The introduction of manual training into American public schools naturally led to the development of sewing and cooking as branches of study for girls, and courses of this kind have been established in the grammar schools and high schools of many of the large cities throughout the country. In many cities there are manual training high schools with domestic science as a strong feature. The manual training high school of Kansas City offers domestic art as an elective, and was able in 1902–3 to accommodate 650 girls in one-, two-, and three-year classes. Downer College, Milwaukee; the State College of Agriculture, Ames, Iowa; the Minnesota State Agricultural College; the State Normal School at New Paltz, N. Y.; are only a few of the many institutions where a thorough training is offered. In New York the following institutions are teaching domestic science in all or part of its phases: Teachers' College; the Manhattan Trade School for Girls; the Girls' Technical High School; Pratt Institute, Brooklyn; the Hebrew Technical School for Girls; and the evening public schools of Manhattan, Brooklyn, and Queens.

A normal course in domestic science covers three years. The work of the first year includes psychology, history of education, chemistry, physiology, drawing, cord-work, weaving, basketry, sewing, cooking, and physical training. At the end of the first year the student is able to decide whether she is best qualified to teach domestic science or domestic art. If the latter specialty is preferred she takes advanced sewing, dressmaking, millinery, drawing, water color, design, history of costume, embroidery, normal methods, and bacteriology. Into such training embroidery as mere fancy-work does not enter; art principles and educational significance being determining factors, and individuality being demanded in the student's work. She must be something more than a skilful needle-woman.

The same philosophical attitude is preserved in the teaching of cookery, and the young woman trained in these normal classes is not a simple cook; she is a chemist and a dietary expert, understanding both the theory and the practice of

her art. It is evident that educators do not view the subject from a merely utilitarian view-point. The educational value of domestic science and art are recognized and emphasized. As instructors in these branches, women of sound education and thorough professional knowledge are required. Schools and colleges in all parts of the country are demanding such teachers; and the vacation schools, settlements, and other institutions of all large cities in the East claim a large number of them. One sphere which is opening to women with such qualifications is that of the dietary expert in penal and philanthropic institutions. A field so large as that offered to graduates of schools of domestic science and art will not soon be overcrowded.

Domestica'tion, the modification of animals by deliberate interference with their food and surroundings, with the work of functions they perform, but especially with their breeding. Man has exterminated some animals — for example, birds, and propagated others — for example, fishes; he has made many become rare, shy, and cunning, while others (for example, dogs and cats) find shelter in his dwellings; he has kept some captive, like the fish in the pond; tamed others for his service, like horses and oxen; he has preserved some artificially from their enemies, because of their rarity, and others because of their utility. When a distinct breed has been produced by human interference, in most cases deliberately by artificial selection, we call the result domestication. Strictly "domesticated animals" correspond to strictly "cultivated plants"; in both cases the organisms have been modified, more or less fixedly, from their natural or wild state, by changes in food and environment, function, and breeding.

Domestication began long before the dawn of history (see AGRICULTURE; ANTHROPOLOGY; DOG). Among lower animals, silk-moths (see SILK) and hive bees (q.v.) have been for long controlled, and to a limited extent modified. Among fishes, gold-fish (q.v.) may certainly be regarded as domesticated for decorative purposes. Birds include many illustrations of domestication — pigeons, fowls, ducks, geese, peacocks, turkeys, guinea-fowls, canary-birds, etc. Among mammals, dogs and cats, horses and asses, cattle, sheep and goats, elephants, camels, reindeer, pigs and rabbits, etc., have been domesticated, and have given rise to many different breeds. The complete list is not a long one, yet probably it will not be increased. To admit of domestication, animals must generally be social and docile in their habits, and must be capable of retaining fertility under changed conditions.

The process of domestication, as far as deliberate control is concerned, is for the most part equivalent to selective breeding. Different breeds differ from natural species in being usually mutually fertile. In other words, while two domestic races may be externally more different than are two nearly related species in nature, the reproductive elements in the first case cannot differ as they must do in the second. Thus crossing is usually successful between domestic breeds, only rarely between adjacent natural species. When we pass beyond selective breeding to inquire into the conditions of variation, a much more difficult problem is raised. In regard to some changes which crop up in domestic animals, we cannot do more at present than refer them to variations in the unstable germ-cells, and to the intermingling of sexual reproduction. Where the intercrossing is regulated, the importance of the latter is especially obvious. These germinal changes may, however, as the organism grows, find expression in the continually variable rhythm between nutrition and reproduction, between growth and multiplication — the great antithesis of organic life. But while considering this internal aspect, we have at the same time to recognize the importance of external influences, especially of altered climate and diet. These hinder or abet the constitutional or inherited tendencies, and may in course of time bring about important new results. Domesticated forms are more variable than their wild relatives; the males are more variable than the females; and the offspring of hybrids are more unstable than the hybrids themselves.

The results of domestication are very varied. Sometimes the changes induced and cultivated have been comparatively slight, in other cases they have amounted to the evolution of new species. These changes are abundantly illustrated in Darwin's classic work on variation under domestication.

Domett, dŏm-ĕt' or dŏm'ĕt, **Alfred,** English poet: b. Camberwell, Surrey, England, 20 May 1811; d. London 12 Nov. 1887. He was the original of Browning's 'Waring.' He lived in New Zealand, 1842–71, and became a colonial statesman of eminence. His verse attracted much attention, the best specimens being in the volumes 'Ranolf and Amohia' (1872); and 'Flotsam and Jetsam: Rhymes Old and New' (1877). See Gisborne, 'New Zealand Rulers and Statesmen' (1897).

Domicile is the permanent, fixed home of a person, with no present intention of removing therefrom. A person traveling from one city, State, or country into another does not change his domicile and create a new one at every place he stops, but the place to which he intends to return and reside permanently is his domicile. Generally speaking, a person can have but one domicile at one time; but for different purposes, he may have more than one domicile at one time. Some things for which it is necessary to have a domicile are: administration of a person's estate, jurisdiction, taxation, and homestead exemptions. In America, the place at which a person exercises his political rights and privileges, and which he calls his home, is considered his domicile. The two things necessary to a domicile are an actual residence and a present intention of remaining there.

After a person has once acquired an actual domicile, he does not lose it by a temporary absence, no matter how long it is continued, if he intends to return; and in cases where a person changes his domicile he does not lose the old place of domicile, until he has actually acquired the new one. While the intention of the person enters into the question of domicile, it is not a controlling feature; and in a change of domicile the intention must be reinforced by some act, such as exercising a political right, engaging in business, paying taxes, and executing a will, according to the laws of the place; all of which are evidence of the intention to create a new domicile. When persons are mar-

riage the wife acquires the domicile of her husband, and all children born acquire the domicile their father had at the time of their birth. If a widow with minor children marries, the domicile of the children is not changed until there is an actual removal. Illegitimate children acquire the domicile of their mother in some jurisdictions, if acknowledged by their father, they acquire his domicile.

A person absent from home on the service of his government, such as an ambassador, consul, soldier, or sailor, does not change his domicile; unless, after the service is finished, he continues to reside at that place. A convict or prisoner, a person attending a college or university, does not change his domicile. A person may acquire a commercial domicile in a place different from that in which he lives. When a person goes to a foreign country and engages in business there, he is considered a merchant of that country; and it makes no difference what the relations of the government of the countries are with one another.

A guardian cannot change his ward's domicile from one country or State to another; and it is doubtful even if he can change the domicile from one county to another in the same State. The nature and purpose of the appointment of a guardian may, however, change the general rule. The appointment of a guardian will not prevent the ward from changing his domicile. Although the domicile of the wife is considered as that of the husband, yet in actions for divorce, a husband, after giving his wife a cause for divorce, cannot acquire another domicile so as to deprive her of that right. In wills, the law of the domicile of the testator governs as to the validity of the execution and the distribution of personal property; but as to real estate, if it is to pass under the will, the testator must execute the will according to the laws of the place where the property is situated. Corporations are considered as domiciled in the county or State from which they have derived their charters.

Dominant, in music, is the fifth note above the tonic or keynote of any scale. It is always major in both major and minor modes, as its harmonies rule or determine the scale. Originally so called because in the ecclesiastical system it was the principal reciting note of the Gregorian chant. It also marks the division of the scale into two co-ordinate parts, as in a fugue when the subject commences with the tonic the answer starts with the dominant, or the reverse. In the sonata form it used to be an almost invariable rule to start the second subject in the dominant key.

The *dominant chord* is the major triad on the fifth of the major or minor key. Thus of *C* the triad would be *g-b-d*. A *dominant seventh* is formed by adding a minor seventh to the triad. Add *f* to the dominant triad given above and you have the dominant seventh of *C*.

Domingo, San. See San Domingo.

Dom'inic, Saint, founder of the order of Dominicans or Preaching Friars: b. Calahorra, in Old Castile, Spain, 1170; d. Ravenna, Italy, 6 Aug. 1221. According to the legendary story of his life his future eminence in the Church was foreshown to his mother before his birth by preternatural premonition, for she dreamed that she saw a dog presenting to her child a flaming torch with which to set the world ablaze. This explains the meaning of the dog with torch in his mouth, seen in many pictures of Saint Dominic. In childhood he gave signs of extraordinary piety and love of ascetic practices. At 17 he entered the University of Palencia (removed later to Salamanca), and devoted himself to the study of philosophy and ancient literature. Here he once sold his clothes in time of famine to obtain the means of relief for the poor; on another occasion he offered himself to be a slave to the Moors in exchange for a widow's only son. He stayed in the university 10 years, and, having been ordained priest, was made a member of the cathedral chapter of Osma, and in that station was the zealous assistant of the bishop in suppressing abuses in the Church. He accompanied this bishop on an embassage to France in 1203, and in passing through Provence was grieved by the extreme laxity of morals in clergy and laity and the alarming progress of the various Manichæan sects. Dominic vowed himself to a life of evangelical labor among those sectaries, and resolved to make all possible efforts for the correction of the evils which menaced the existence of the Church in those parts. There were already in the field legates commissioned by the Pope to win the erring back to the fold; but Dominic was scandalized by their worldly pomp, and declared that not in costly attire and with a showy retinue should they approach the misguided Albigensians and poor men of Lyons, but barefoot and without purse or scrip; and the papal envoys, persuaded by the words of the zealous evangelist, laid aside their state and for a while followed the examples of humility and zeal set by Dominic. But their preaching proving unfruitful, they retired from the field and reported to Rome their failure. Nor was Dominic himself rewarded with much success, though the annals of his life tell of great miracles which attended his progress through the country. Then resort was had to force, and a crusade against the Albigensian heretics was proclaimed; which was conducted by Simon de Montfort with extreme severity till, at his death in the siege of Toulouse, resistance on the part of the Albigenses was overcome. No proof exists that Dominic either prompted the crusade or had any part in it; but it is certain that he was a friend of Simon de Montfort and of his family. He quit the country in 1217, one year before the end of the war, and withdrew to Rome where he spent the remainder of his life in organizing the order of Preaching Friars. He arranged the prayers and meditations of the devotion called the 'Rosary,' much in use by Roman Catholics in all parts of the world. See Dominicans; Rosary. Consult: Drane, 'Life of Saint Dominic'; Lacordaire, 'Vie de Saint Dominique.'

Dominica, dŏm-ĭn-ē'kà, or **Dominique**, dōm-ē-nēk', West Indies, an island in the northern half of the Caribbean chain of the Lesser Antilles. (See Antilles.) It is the largest of the British Caribbees, being 29 miles long, 16 miles broad, and having an area of 291 square miles; it has also the highest summit of this volcanic island chain, the Morne Diablotin (5,314 feet), several thermal springs, and an old crater-lake about 2,800 feet above sea-level which formerly "was flooded by boiling water from springs bubbling up from the bottom, and every

five minutes upheaving in a foaming geyser." The area of this lake was diminished by landslides which occurred in 1880, but it is still of great depth. The rainfall of the island is very abundant. The summer temperature is about 80° F.; that of winter, spring, and autumn about 70° F. An interesting part of the population is a group of Caribs (q.v.), though these aborigines are now largely mixed with the blacks. "They inhabit the mountains of the interior, and make their livelihood by weaving a peculiar basket which is universally used in the island for carrying baggage." The blacks referred to, descendants of African slaves of the period when Dominica belonged to France, are by far the most numerous element; they, as well as most of the white inhabitants, speak a French patois, and "still look upon the British owners as foreigners." With the exception of the Indians, the people live near the coasts. In the luxuriance and beauty of its vegetation, Dominica excels the other neighboring islands. Its soil is a rich brown mold, in which all tropical products grow readily. Of its 186,240 acres, two thirds are crown lands, but the government has utterly failed to promote agriculture, which is now nearly ruined. Exports are cattle, cocoa, lime-juice, rum, molasses, and sugar. The revenues do not equal expenditures, and taxes are increasing. Dominica is a presidency, belonging to the British Leeward Island administrative group, which includes also St. Christopher, Nevis, Antigua, Barbuda, Montserrat, Redonda, and the British Virgin islands, the seat of the Leeward government being at St. John, Antigua. The local government is conducted by a commissioner, or president, an executive council of seven members, and a legislative assembly. These officials exercise their authority at the small town of Roseau, which is situated on the western side of the island, and has wide and regularly paved, but deserted, streets, a botanical garden, a public library, and French (Catholic) and English churches. The name of the island (from Spanish *Domingo*, Sunday) is due to the circumstance that Columbus discovered it on the first day of the week, 3 Nov. 1493. The warlike Caribs retained control of it during two centuries, but little by little French settlers gained a foothold, and in the 18th century its possession was regarded as essential to the maintenance of French prestige in the West Indies, owing to its situation between the important dependencies of that country, Martinique and Guadeloupe. For that very reason the English insisted upon its surrender, in the final balancing of international accounts after the imperial wars, early in the last century. Many laborers have migrated to South America in search of employment. R. T. Hill says, in his 'Cuba and Porto Rico, with the Other Islands of the West Indies': "Formerly the slopes of Dominica were covered with coffee-trees, but this industry has practically disappeared. In 1843 there there was as much as 1,333,000 pounds of coffee, besides rum, sugar, and molasses. The coffee culture even reached 2,500,000 pounds in 1828. Now the whole of this industry has vanished, except a few trees set out within recent years. Faint attempts are being made to increase the production of cocoa, limes, and lime-juice, as well as of essential oils." It would be fairer, however, to ascribe Dominica's economic decline to the low price of both of her natural products, sugar and coffee. The population in 1881 numbered 28,211; a decade later it was only 26,841; and the exodus still continues.

Domin'ical Letter (from Lat. *Dominica*, Sunday), properly called Sunday letter, one of the first seven letters of the alphabet used in calendars to designate the Sundays throughout the year. The ancient Romans used the first eight letters, A–H, to denote their nundinal period; the early Christians dropped the eighth and adopted the remaining seven to indicate the days of the Hebrew week. These seven letters are employed to show on what days of the week the days of the month fall throughout the year. One of those seven letters must necessarily stand against Sunday, and is printed as a capital, and called the dominical letter or Sunday letter; the other six being inserted in different type, to denote the other six days of the week. Now, since a common Julian year contains 365 days, if this number be divided by seven (the number of days in a week), there will remain one day. If there had been no remainder it is obvious the year would constantly begin on the same day of the week; but since one remains, it is plain that the ordinary year must begin and end on the same day of the week; and therefore the next year will begin on the day following. Hence when January begins on Sunday, A is the dominical or Sunday letter for that year; then, because the next year begins on Monday, the Sunday will fall on the seventh day, to which is annexed the seventh letter, G, which, therefore, will be the dominical letter for all that year; and as the third year will begin on Tuesday, the Sunday will fall on the sixth day; therefore F will be the Sunday letter for that year. Whence it is evident that the Sunday letters will go annually in retrograde order, thus, G, F, E, D, C, B, A; and in the course of seven years, if they were all common ones, the same days of the week and dominical letters would return to the same days of the months. But because there are 366 days in a leap-year, if the number be divided by seven, there will remain two days over and above the 52 weeks of which the year consists. And therefore, if the leap-year begins on Sunday, it will end on Monday; and as the year will begin on Tuesday, the first Sunday thereof must fall on 6 January, to which is annexed the letter F, and not G, as in common years. By this means, the leap-year returning every fourth year, the order of the dominical letters is interrupted, and the series cannot return to its first state till after four times seven, or 28 years; and then the same days of the month return in order to the same days of the week as before. This method of indicating the days still holds its place in Church calendars without variation from the beginning.

Dominican Republic, West Indies, a country which occupies the eastern and central portions of the island of Santo Domingo, or Haiti: bounded on the north by the Atlantic Ocean, on the south by the Caribbean Sea, on the west by the republic of Haiti, and separated by the Mona Passage from Porto Rico on the east. Its area is commonly estimated at 18,045 square miles.

Political Divisions.— The country is divided into six provinces and five maritime districts, each administered by a governor appointed by

the president; the governors, in turn, appoint the prefects who preside over communes, cantons, and sections. Principal cities and villages are: The capital, San Domingo city (q.v.), regarded as one of the most perfect specimens of a 16th century Spanish-American town, but now in decadence; Santiago de los Caballeros (q.v.), also one of the oldest places in the New World, situated in the northern plain called Vega Real, about 100 miles northwest of the capital; Puerto Plata, on the north coast, connected by rail with Santiago; Concepcion de la Vega, on the river Camu, near Santiago; Azua de la Compostella, on the south coast, about 55 miles west of San Domingo city; Samaná, on the bay of that name; Monte Cristi, on the north coast; and Seybo, 50 miles northeast of the capital. The last four are very small places, of 1,000 to 5,000 inhabitants.

Outlying Territory.— For adjacent islands see SANTO DOMINGO, ISLAND OF. Some of the general physical characteristics of the main island are also discussed more fully in that article.

Topography and Physical Geography.— The mountains — the centre and culmination of the Great Antillean uplift — form several cordilleras or roughly parallel ranges. The highest peak, Mount Tina (10,300 feet), is northwest of San Domingo city, and near the centre of the island are numerous peaks from 8,000 to 9,000 feet high. While the enormous mass of these mountains, occupying four fifths of the island, renders much of the territory nearly inaccessible, between the ranges lie plains, some of which are wonderfully fertile. Toward the north and west are the famous Vega Real and the plain called Despoblado de Santiago; near the south coast the rich valley of Baní, which extends between the Nizao and the Ocoa; and in sequence the valleys of Azua, San Juan, or Antigua Maguana, Santo Tomé, Onceano, Hincha, Quava, and others; toward the east, extending even to Cape Engaño, is a region in which the *praderias* or *llanos* — valleys, meadows, or plains — are most common. Even the ridge of the Cibao Mountains sinks to a height of only 1,000 feet at its eastern end.

Rivers and Harbors.— The Ozama and Isabela rivers unite to form the port of San Domingo after receiving the waters of many smaller streams, such as the Yavacao, the Monte Plata, and the Savita. The Haina, or Jaina, which empties into the sea about 10 miles west of San Domingo city, and the Nigua, whose course is still farther toward the west, enclose a very beautiful plain which was a source of wealth during the Spanish period. The Nizao flows southward between fields of sugar-cane and meadows where herds of cattle graze. Other rivers are the Artibonito, Yaqui, Yuna, Naranja, and Magua. The coast-line, about 940 miles in extent, includes the Bay of Samaná — a well-sheltered harbor extending westward from the Mona Passage, its average width being 12 or 13 miles and its length more than 25 miles. It has been pointed out that this bay would accommodate the largest fleets, and that defensive works placed at its entrance would make it practically impregnable; its strategic value is certainly so great that it should be reckoned one of the republic's chief assets. The other open ports are: on the north, Puerto Plata, Monte Cristi, Macoris, and Sanchez; on the south, San Domingo city and Azua.

Geology and Mineral Resources.— The geology of the island, as described by Blake, Marvin, and others, is similar to that of the eastern ends of Cuba and Jamaica. There are, according to Robert T. Hill, four principal formations: "the older mountain rocks, of Cretaceous and Tertiary Age, made up of igneous rocks and clays, mantled by gravels and crystalline limestone; the white limestones of Tertiary Age; recent alluvial formations; and the coast limestone of elevated reef rock. No recent volcanic rocks are known." For the Antillean mountain system, compare CARIBBEAN SEA and CENTRAL AMERICA. It is customary to say that the mineral resources of the republic have been either neglected or exhausted; and it is, indeed, quite certain that, whereas the Spaniards obtained large amounts of gold and silver, especially the former, from the mines that were worked during the early years of colonization, recent reports made by American experts are not especially favorable with regard to these two metals. The fact, however, seems to be that gold exists quite generally, but not in paying quantities if we allow for high-priced labor. The profits of the old mines were won by the labor of native and African slaves. Copper, iron, manganese, platinum, tin, marble, antimony, and chalcedony are found; and the analogy of the Santiago de Cuba mining region would suggest that the deposits of the first three metals deserve particular attention. Valuable petroleum lands have been found near Azua.

Soils and Climate.— The diversities of both soil and climate are greater than elsewhere in the Antilles. Thus, the Vega Real is fertile and well-watered; the Santiago plain, its western prolongation, is a desert. The soil of the western part of the plain of Seylo is gravelly, while that of the eastern part is composed of loams and clays. The country immediately surrounding Azua is barren; but the best sugar estates on the island are only three miles away — and the sugar-lands of no other West Indian island can quite rival in fertility San Domingo's best. The heat in low-lying and sheltered districts is intense: "fatal to Europeans," says an eminent Spanish authority. At an elevation of more than 1,600 feet, the nights are cold. Coasts and plains of a moderate elevation which have the benefit of the east wind are regarded as comparatively healthful: the capital, for example, where the temperature averages 64° F. in the morning and 85° F. at noon. The climate of Santiago de los Caballeros is fairly salubrious. The arid regions are chiefly the lower slopes on the windward side of the island; in the high mountains the precipitation of moisture is excessive. The rainy season culminates in May and June.

Forests, Flora, and Fauna.—Cedar, lignum vitæ, mahogany, and other cabinet-woods, as well as timber used in house- and ship-building, are taken from the forests, which also produce logwood, fustic, etc. (see list of exports); the most luxuriant growths, however, have no present commercial importance, because adequate means do not exist for bringing them from the interior regions to the coast. As in other parts of the Antilles, the forms of vege-

table life are varied and of special interest, while precisely the reverse is true of the fauna. See SANTO DOMINGO, ISLAND OF.

Agriculture.— In the south and west are the principal sugar plantations; the area of tobacco is the north and some parts of the uplands of the interior; coffee grows readily in the mountain regions, and in the district of Barahona its production on a large scale has begun; the cultivation of cocoa, like that of sugarcane, has increased rapidly since about 1885; cattle raising also receives a little more attention than formerly was the case; tropical fruits, especially bananas, flourish nearly everywhere.

Exports and Imports.—An official résumé of the exports through the custom-houses of the republic during the first half of 1902 shows the values of the principal articles of export to have been as follows: — sugar $1,962,814.18; cacao $750,530.32; coffee $188,500.00; bananas $37,836.50; wax $34,036.49; leaf tobacco $26,974.07; goatskins $22,051.56; ox-hides $20,313.04; campeche wood $10,730.00; mahogany logs $8,217.52; guayacán $7,078.32; honey $5,056.00; divi-divi $4,176.00; espinillo wood $2,701.45; live animals $2,691.00; bera $1,971.50; mahogany forks $1,570.00; sisal rope $1,419.40; and, less than $1,000 each: raw cotton, deer horns, yarey fibre, caya wood, cedar, tortoise shells, moss, molasses, mora wood, rum, and sole leather. The total value of exports in 1901 was $5,190,036.64. Of imports, the total value in ordinary years is somewhat more than one half that of exports, the large items being cotton goods, hardware, and provisions.

Railways, etc.— Besides the railway referred to above, which crosses two mountain ranges and connects Santiago with Puerto Plata, another line to furnish transportation from Samaná Bay to Santiago has been built to a point beyond La Vega. There are 430 miles of telegraph, and 51 post-offices. The difficulties of communication between the various districts of the country, primarily due to the cordilleras, are in part attributable to the government's neglect to build good highways — without which peace will never be assured. Several concessions for railways were granted in 1901. The republic has regular communication with America and Europe by means of the lines of steamships calling at its ports.

Government.— The constitution vests the executive power in a president chosen by an electoral college for a four years' term only; both he and the vice-president, however, are eligible for immediate re-election. The congress (a single house) is composed of two members from each province and maritime district, elected by direct popular vote with restricted suffrage. The cabinet in 1902 included the following secretaries: of interior and police; of war and marine; of foreign affairs; of justice and public instruction; of public works; of finance and commerce; and of posts and telegraphs.

Finances.— The customs revenue fluctuates a good deal. Thus, in 1896 it was $1,545,450; but $2,392,052 in 1900; while the customs receipts for 1901 amounted only to 1,876,145 *pesos*, according to the report of the Belgian consul at San Domingo city; and again the United States minister to the republic shows that the receipts from the several ports during November 1902 were $87,000, or less than one half as much as in November 1901. The export tax on sugar was repealed 1 March 1902; otherwise duties are levied on both imports and exports. The public debt amounted to $13,589,750 before 1898. In 1901 the foreign debt amounted to about $21,000,000 and the internal debt to $2,845,550 gold and $10,126,629 silver. The San Domingo Improvement Company, of New York, was entrusted with the collection of the customs duties 1 March 1893.

Army and Navy.—A regiment of soldiers is usually stationed in each province, and these, with the reserve corps, constitute the army. The government has three small gunboats.

Population.— The number of inhabitants in 1888 was, on high Spanish authority, 417,000, but according to an official estimate 610,000. No recent enumeration is trustworthy. The Despoblado region — the nearly uninhabited district of high mountains, inaccessible valleys, and virgin tropical forests — comprises, roughly speaking, the central third of the entire area of the island, or one half of the Dominican republic: it is the wide border-land fought over by the Haitians and the San Domingoans. The latter, of blended Spanish, Indian, and negro blood — with the small proportion of white descendants of the Spanish colonists and foreign merchants — occupy a restricted area, and, it is thought, scarcely number 600,000. Spanish is the language most in use.

Education, Religion, Judiciary.— Free primary instruction is offered by the communes, with the aid of the central government; the system including also superior technical and normal schools, and a professional school or university. There are about 40 newspapers. The state religion is the Roman Catholic. Religious toleration under "certain restrictions" is assured by the government's present policy of encouraging immigration. There are, beside the supreme court, 11 district tribunals and the municipal courts.

History.— Columbus, on his first voyage to America visited the north coast of the island and left a few of his men. These were killed by the natives; but the colony of Isabela, established on his second voyage, endured until the colonists were transferred to a more healthful locality. His settlement on the south coast, near the present city of San Domingo, was made during his third voyage — that of 1498. Spanish settlements existed also at Concepcion de la Vega, Puerto Plata, Santiago de los Caballeros, and Bonao in the first decade of the 16th century. The cultivation of sugarcane began in 1506. Three years later Christopher and Bartholomew Columbus were imprisoned by Bobadilla in the citadel of San Domingo. The natives were set to work in the mines and fields; and very soon shiploads of Indians were being transported from other islands to replace those who died under the hardships of this forced labor (see BAHAMAS). Negroes were brought from Africa for the same purpose, a considerable number of black slaves reaching the colony before 1522. There was a short period of prosperity; before the middle of the century, however, the most enterprising colonists were drawn away by the superior attractions of Mexico and Peru, and the country began to suffer from the attacks of English and French buccaneers, who established their headquarters on a small island near the northwest corner of

Haiti. In the course of a century and a half the section west of the Despoblado, and now known as the republic of Haiti, was won for France. The Spanish government at the close of the 18th century abandoned the eastern section as well, the entire island passing, first, under French control; but soon afterward the successes of Toussaint L'Ouverture and Dessalines (q.v.) united west and east in one country, independent of the European powers and governed by the black revolutionists of Haiti. Between 1809 and 1821 Spain again held the eastern section, and the old name Santo Domingo was revived with that limited application; but in the year last mentioned the San Domingoans revolted. Many of the Spanish families withdrew permanently from the island. San Domingo and Haiti were united from 1822 to 1843, together forming the republic of Haiti. The final separation took place in 1844, when the Dominican republic was established. Spain reasserted her authority once more for a brief period (1861–5); with that exception the many struggles through which the country has passed since 1844 have been due either to revolutions or to Haitian antipathy. In 1869 a treaty for the annexation of the Dominican republic to the United States was negotiated, during Gen. Grant's presidency, but was defeated in the United States Senate. A revolution which drove President Baez into exile expressed the resentment of the San Domingoans when this failure was made known. Comparatively good order was maintained for a few years, beginning in 1890, but the most violent methods were resumed by political leaders in 1898–9, and continued in 1902–3. President Jimenez was forced by a revolutionary uprising to resign his office in May 1902. His successor, Vasquez, was driven from power early in May 1903, after severe fighting, attended with heavy losses.

Bibliography.— Bulletins of the International Bureau of the American Republics; Chevalier, 'Lettres sur les maladies de St. Dominique,' etc.; Edwards, 'An Historical Survey of Saint Domingo'; Fabens, 'Life in San Domingo'; Guillermin, 'Journal historique de la révolution de la partie de l'Est de Saint-Dominique'; Harvey, 'Sketches of Hayti,' etc.; Hazard, 'Santo Domingo, Past and Present'; Hill, 'Cuba and Porto Rico, with the Other Islands of the West Indies'; Perkins, 'Reminiscences of the Insurrection of St. Domingo'; Sumner, 'Violations of International Law and Usurpations of War Powers': a speech delivered in Senate of United States 27 March 1871.

MARRION WILCOX.

Domin'icans, or Friars Preachers, or Preaching Friars (*Fratres Prædicantes*), the religious order founded by St. Dominic. While laboring in Provence for the conversion of the Albigenses, Dominic associated to himself 16 disciples eager, like himself, to devote their lives to the work of reclaiming heretics and ministering to the spiritual needs of the poor and ignorant. In 1215 he visited Rome to obtain from the Holy See approval of the institute he proposed to form. Of the 16, 8 were French, 6 Spanish, 1 Portuguese, and 1 English. The Pope (Innocent III.), in conformity with the decree of the Lateran Council, then in session, against approval of new religious orders, refused again and again his consent, but at last promised to give his approbation on the condition that the friars should adopt as their own the monastic rule of the Augustinians. The condition having been fulfilled, the order was formally approved in 1216 by Innocent's successor, Honorius III. The costume of the friars was to resemble that of the Augustinians, and to consist chiefly of a black cassock and rochet; but a few years afterward this was changed for the white habit and scapulary with outside black mantle, which is still the costume of the Dominicans. Their name Black Friars was given them because of the black mantle worn out of doors. The memory of their great monastery in London is preserved in the name Blackfriars Bridge. Houses of the new order were immediately founded in France, the Rhineland, and Italy; and in 1221 was held the first general chapter of the order at Bologna in which were represented 60 convents of preaching friars. That same year arrived in England the first band of Dominicans, 12 of the brothers in charge of Gilbert de Fremey. At this chapter an addition was made to the rule of the order, by which the Dominicans were forbidden to hold any possessions or have any fixed incomes; but to live by the voluntary alms of the people: thus the Friars Preachers became mendicant friars like the Franciscans. All the universities were opened to the young scholastics of the order, and soon many preaching friars attained the foremost rank as philosophers, divines, canonists and scholars. Among divines and philosophers the Dominicans Albert the Great and Thomas Aquinas hold the highest places; the celebrated German mystics and divines Meister Eckhart, John Tauler, and Henry Suso were Dominicans. The great mediæval encyclopædic work, *Speculum Majus*, was the work of a Dominican, Vincent of Beauvais. The highest places in the Church have been occupied by Dominicans; since the order was founded there have been 3 Dominicans popes, 60 cardinals, 150 archbishops, and more than 800 bishops. A second and a third order were also founded by St. Dominic, the second order being for women, and the third for men and women living in the world, engaged in secular pursuits and married. (See TERTIARIES). The Dominican houses suppressed in England by Henry VIII. numbered 58.

Dominis, Marco Antonio de, mär'kō ān-tō'nē-ō dā dōm'ē-nēs, Italian theologian and ecclesiastic; b. Arbe, an island in the Adriatic, 1566; d. Rome 28 Sept. 1624. He studied in the college of the Jesuits at Loretto and in the University of Padua, and was made bishop of Segni 1596, and archbishop of Spalatro or Spalato 1602. Here he projected schemes for the reformation of the Church and unification of Christendom, but came into disfavor at the Roman court and had to quit, take refuge at Venice, where he made the acquaintance of Bedell, chaplain of the English embassy, afterward bishop of Kilmore in Ireland. De Dominis accompanied Bedell to England and through his influence obtained from King James the deanery of Windsor and other places in the Established Church. He was zealous for the overthrow of

the papal system and published in London (1670) a work in Latin, 'De Republica Ecclesiastica,' designed to prove that the Pope possesses in the Church only a primacy of honor not of jurisdiction. In 1619 was published his translation into English of Fra Paolo Sarpi's 'History of the Council of Trent.' He returned to Rome 1622, at the instance of the Spanish ambassador at London, who led him to believe that he would be welcome there and would be raised to the cardinalate. He published a recantation of his subscription to the Anglican articles of religion, but his hopes of honors at Rome were disappointed, and in letters to his friends in England he recanted his recantation: but the letters never reached their destination, having been seized by the papal officers. He was thrown into prison by order of Urban VIII. and there died 1624. After his death he was adjudged a heretic: his body was disinterred and burned, and the ashes thrown into the Tiber. In 1611 was published his tract, 'De radiis visus et luces in vitris perspectivis et iride' ('Of the Rays of Vision and Light in Perspective Glasses and the Rainbow'), in which is probably for the first time proposed the true theory of the rainbow.

Domin'ium (Lat. *dominus*, a master), in Roman law, the right by which any one exercised control over property, and by which he was entitled to retain or alienate it at pleasure, as opposed to a mere life interest, or possessory or equitable right. *Dominium directum*, in feudal law, is the interest or superiority vested in the superior; and *dominium utile* is the interest in property vested in the vassal, which amounts to the right of merely using it (see SERVITUDES, USUFRUCT) as distinguished from that of his lord's ownership and supremacy.

Domino. See MASK.

Domino Whist. See FIVE OR NINE.

Dominoes, a game played with small flat rectangular pieces of ivory, about twice as long as they are broad. They are marked with spots varying in number. Each domino has two sets of spots ranging in number from 0 up to 12, which are distributed in all possible combinations — 0–0, 0–1, 0–2, 0–3, etc., to 0–12; then 1–1, 1–2, 2–3, 2–4, and so on up to 12–12. Those which have the two sets of spots alike — 2–2, 3–3, etc., are called double twos, double threes, etc. The game is to appearance remarkably simple, but is played in a variety of ways. The general principle of all the varieties is that when one player leads by laying down a domino, the next must follow by placing alongside of it another which has the same number of spots on one of its sides. Thus if the first player lays down 6–4, the second may reply with 4–8, or 6–7, etc.; in the former case he must turn in the 4, placing it beside the 4 of the first domino, so that the numbers remaining out will be 6–8; in the latter case he must turn in the 6 to the 6 in like manner, leaving 4–7, to which his opponent must now respond. The player who cannot follow suit loses his turn; and as the object of the game, modified by special conditions in the different varieties, is to get rid of all the dominoes in hand, or to hold fewer spots than your opponent when the game is exhausted by neither being able to play, it is a special point of play to shut out your opponent when it can be done without injury to your own hand.

Dom'inus, the Latin word which we commonly render by "lord," but which more properly signifies the master of a house, and his eldest son, as opposed to slave (*servus*). The Scottish "dominie," in the sense of schoolmaster, is of course taken from it, as is the same term in America, where in some places it is the title of a minister of the Dutch Reformed Church, and in others is applied to Protestant clergymen generally.

Domitia, dō-mĭsh'ĭ-ą, Roman empress: b. Gaul about 56 A.D.; d. Rome about 100 A.D. She was the daughter of Domitius Corbulo, a general of Nero's reign. She was married first to Ælius Lamia, but the Emperor Domitian took her for his wife. Finding that her new husband intended to have her executed she caused his assassination in 96 A.D. Her subsequent career is uncertain.

Domi'tian, Titus Flavius Domitianus Augustus, Roman emperor: b. Rome 24 Oct. 51 A.D.; d. there 18 Sept. 96 A.D. He was a son of Vespasian, and brother of Titus, and made himself odious, even in youth, by his indolence and voluptuousness, and his cruel, malignant, and suspicious temper. He became emperor 81 A.D. At first, indeed, he deceived the people by acts of kindness, good laws, and a show of justice, so that their fears vanished; but he soon returned to his former excesses and cruelty. Agricola's victories exciting his jealousy, he recalled that general to Rome, and kept him in total inactivity. At the same time he spread terror through Rome by the execution of a great number of the first citizens. He gave himself up to every excess, and to the meanest avarice. He at last conceived the mad idea of arrogating divine honors to himself, assumed the titles of Lord and God, and claimed to be a son of Minerva. His principal amusement consisted in the shows of the circus. The misery of the people was, meanwhile, continually increasing; and after the revival of the law against high treason, which enabled almost anything to be construed into this crime, no one was secure of his property or his life. A paper fell into the hands of his wife, Domitia, in which she found her own name, and those of the two commanders of the prætorian guards, with many others, noted down by the emperor as victims. This discovery induced her to conspire against him, and he was killed by a freedman named Stephanus.

Domremy-la-Pucelle, dôn-rā-mē-lä-pü-sĕl (original, Domremy; La Pucelle, that is, The Maid, has been added in honor of Joan of Arc), a small village in the department of the Vosges, in France, not far from Vaucouleurs, in the department of the Meuse. It is noted for being the birthplace of Joan of Arc. The village contains a bronze statue of the heroine, and another monument to her, and the cottage in which she was born still stands. A chapel on a neighboring hill marks the spot where she is said to have learned of her great mission. There is here also a museum. Domremy was exempted from taxation till the Revolution, in honor of the warrior-maiden.

Don (Lat. *dominus*), a Spanish title of honor, originally given only to the highest nobility, afterward to all the nobles, and finally used indiscriminately as a title of courtesy. It corresponds with the Portuguese Dom. During the Spanish occupation it was introduced

and became naturalized in some parts of Italy, particularly in Naples.

Don Carlos. See CARLOS.

Don César de Bazan, dŏn sā-zār dŭ bā-zan, the title of a French comedy founded on a portion of Hugo's play, 'Ruy Blas.' Don César is a ruined nobleman who changes his name, and in rags conducts himself with the happy, devil-may-care nonchalance of his better days.

Don Gerard, Dutch painter. See DOW, GERARD.

Don Giovanni, dŏn jō-vän'nē (Italian form of Don Juan, the name of the hero), the title of an opera by Mozart, considered his masterpiece, produced at Prague 29 April 1787.

Don Juan, dŏn jū'an, Sp. dōn hoo-än', the hero of a Spanish legend which seems to have had some historical basis in the history of a member of the noble family of Tenorio at Seville. According to the legend Don Juan was a libertine of the most reckless character. An attempt to seduce the daughter of the governor of Seville brought the indignant father and the profligate don into deadly conflict, in which the former was slain. Don Juan afterward, in a spirit of wild mockery, goes to the grave of the murdered man and invites the statue of him erected there to a revel. To the terror of Don Juan the "stony guest" actually appears at the table to bear him away to the infernal world. The tale has furnished the subject for many dramas and operas. The most famous of the latter is Mozart's 'Don Giovanni' (q.v.). Among the former are: 'Burlador de Sevilla' by Tellez; 'Don Juan ou Le Festin de Pierre,' by Molière; and 'The Libertine,' by Shadwell. The 'Don Juan' of Byron's poem bears no relation to the Don Juan of legend, save the name and libertine character of the hero.

Don Orsino, a novel by Francis Marion Crawford, published in 1892. The author's purpose is to describe a young man of the transition period in Rome after the unification of Italy. He chooses for his hero Orsino Saracinesca.

Don Pasquale, dŏn päs-kwä'lā, an opera by Donizetti, produced 4 Jan. 1843 in Paris. It is considered one of the composer's best, although it never had a place in public estimation, such as was given to 'Lucie'; 'La Favorita'; 'La Figlia del Reggimento'; and others.

Don Quixote, dŏn kwiks'ŏt, Sp. dōn kē-hō'tā, a novel by Cervantes, in two parts, the first of which appeared at Madrid in 1605 and the second in 1615. The hero is a country gentleman who under the influence of the many romances he has read sets forth in search of adventures, accompanied by his squire, Sancho Panza (q.v.). From the hero's name is derived the word quixotic. For the author's aim in writing this book, see CERVANTES.

Don, or **Dun,** a river of Yorkshire, England, which rises near Cheshire, flows east and southeast and joins the Ouse after a course of about 55 miles. By artificial cuttings and canals it has been rendered navigable for vessels of 50 tons, to Sheffield, a distance of about 40 miles.

Don (ancient TANAIS), a river of Russia, which issues from Lake Ivan-Ozero, in the government of Tula, and flows southeast and southwest about 1,200 miles into the Sea of Azof, near the town of Azof, by three mouths, only one of which is navigable. The delta of the Don is an expanse of sandy flats, about 28 by 22 miles at the coast-line. Near its head is the important river-port of Rostov, and Taganrog also shares in the Don traffic. The Don has the most busy trade of all the rivers of south Russia. The navigation is generally stopped by ice for about three months of the year; nevertheless, by means of its lower course, in connection with the Volga, the south provinces of Russia receive much Siberian produce, and also manufactured goods from the interior of the empire.

Don, a river in the county of Aberdeen, Scotland. Its source is several small streams flowing from a bog about 1,000 feet above the sea. It flows east into the North Sea. It is about 75 miles in length. Its salmon fisheries are of considerable value.

Do'na Francis'ca, Brazil, a German colony in the state of Santa Catharina, lying between the Serra do Mar and the Atlantic Ocean, 14 miles inland from the port of São Francisco. Area, 97 square miles; pop. (1903) 21,000. Chief town, Joinville, with 2,700 inhabitants.

Donald, Elijah Winchester, American Episcopal clergyman: b. Andover, Mass., 31 July 1848. He was graduated from Amherst College, in 1869, entered the Episcopal ministry and has been rector of Trinity Church, Boston, from 1892. He has published 'The Expansion of Religion.'

Donaldson, Edward, American naval officer: b. Baltimore 17 Nov. 1816; d. 15 May 1889. He entered the navy in 1835; and in the Civil War took part in the attack on forts Jackson and St. Philip, in the passage of Vicksburg, and in the battle of Mobile Bay. He retired from active service in 1870.

Donaldson, James Lowry, American soldier: b. Baltimore 17 March 1814; d. there 4 Nov. 1885. He was graduated from West Point and entered the army in 1836. He fought in the Florida war, in the Mexican War, and in the Civil War. At the close of the latter he received the rank of major-general in the United States army. He wrote 'Sergeant Atkins' (1871), a story of the Florida war.

Donaldson, Thomas Leverton, English architect: b. London 10 Oct. 1795; d. there 1 Aug. 1885. He was professor of architecture at University College, London, 1841–65, and emeritus professor there for the rest of his career. He published 'Pompeii' (1827); 'A Collection of the Most Approved Examples of Doorways from Ancient Buildings in Greece and Italy' (1833), etc. Among buildings designed by him are University Hall, Gordon Square, London, and the Scottish Corporation Hall.

Donaldson, Washington H., American aëronaut: b. Philadelphia, Pa., 1840. In early life he was by turns a gymnast, a ventriloquist, a conjurer, and a tight-rope walker. A hotel proprietor presented him with a balloon, whereupon he became an aëronaut, and made himself famous all over the United States by his daring and reckless ascensions. On 15 July 1875, he made an ascension from the lake front in Chi

cago and neither Donaldson nor his balloon was ever seen thereafter.

Donaldsonville, La., town, county-seat of Ascension Parish; on the Mississippi River, and the Texas & P. R.R.; about 30 miles in an air line south of Baton Rouge. It is the trade centre of a cotton, rice and sugar-growing county. Pop. (1900) 4,105.

Donatello, dōn-ä-tĕl'lō (properly, DONATO DI BETTO BARDI), a famous sculptor: b. Florence about 1386; d. Florence 1466. His family had several distinguished literati among its members, and repeatedly, from the middle of the 16th century, had given a doge to Venice. His first great works in marble were statues of St. Peter and St. Mark, in the Church of Or San Michele in his native city. His own favorite piece was the statue of an old man in senator's dress placed on the Campanile, and known by the name of Il Zuccone, or The Bald-Head. For the Church of St. John he executed a Penitent Magdalen in wood; but in this branch of art he was surpassed by his friend, Brunelleschi, with whom he made a journey to Rome to acquaint himself with its treasures. After his return to Florence he executed for his patrons, Cosmo and Lorenzo de Medici, a marble monument to their father and mother, which excited universal admiration. One of the principal ornaments of the Church of Or San Michele, is a marble statue of St. George, surpassed by no similar statue which has since been erected. This statue was ordered by the Guild of Armorers (1416). Among his other leading works are a St. John the Baptist, in the Bragello; Judith and Holofernes, in the Loggia dei Lanzi; David, in the Museum, Florence; St. Cecilia, in profile, owned by Lord Elcho, in England. Notwithstanding his strictness he was honored as a father by all his scholars, among whom were Desiderio da Settignano, Benedetto di Majano, and Nanni d'Antonio. Consult: Radcliffe, 'Schools and Masters of Sculptors'; Perkins, 'Handbook of Italian Sculpture'; Clement, 'Sculpture'; and Vasari.

Donati, Giovanni Battista, jō-vän'nē bät-tēs'tä dō-nä'tē, Italian astronomer: b. Pisa 16 Dec. 1826; d. Florence, 19 Sept. 1873. He was appointed in 1852 assistant at the observatory in Florence, of which he became director in 1864. Here he discovered, *inter alia*, the brilliant comet of 1858, which is known as Donati's comet. He afterward was instrumental in erecting the fine observatory at Arcetri, near Florence, and constructed a spectroscope of 25 prisms.

Donation Lands are lands donated by Congress to actual settlers, out of the public domain. On 4 Aug. 1842, the lands in east Florida were thrown open to public settlement, by the grant of a quarter-section (160 acres) to every able-bodied adult. On 27 Sept. 1850, a similar act was passed for Oregon, granting from a quarter-section to a full section according to conditions. Later acts provided for rights of reversion on these. Donations of land for coast defenses, from private individuals to the government, are provided for by law.

Don'atists, a heretical sect in the 3rd century, and till the Vandal invasion a formidable opponent of the Roman Catholic Church in the Mediterranean provinces of Africa. The sect arose out of dissensions at Carthage over the question of the readmission to church fellowship of those persons who in Diocletian's persecution had denied the faith either explicitly or implicitly, by giving up to the persecutors the Christian sacred books. On that point they were extreme rigorists, as also in holding that a priest or deacon could not validly administer baptism if he were himself in a state of sin. When Mansurius was consecrated bishop of Carthage, the faction, headed by one Donatus repudiated him as a *traditor*, one who had given up the sacred books; and when after his death (311), Cæcilian became bishop of Carthage, 70 Numidian bishops refused to have communion with him, as one that was consecrated by a *traditor*. They set up a rival bishop, Majorinus, and the schism grew steadily wider, being specially favored by the peasants. The schismatics were condemned by Melchiades, the reigning Pope, with three bishops of Gaul, in 313. This judgment was confirmed the next year by the council of Arles, and in 316 by the council of Milan, convoked under the protection of the emperor Constantine; but the Donatists paid no heed, and in 330 a council was held by 270 Donatist bishops who denounced their opponents as heretics. The peace not only of the Church but of the civil state was seriously compromised by uprisings of the fanatical multitude against the Roman Catholics throughout northern Africa, to repress which the severe laws enacted by the emperors were ineffective. St. Augustine, bishop of Hippo from 400 to his death in 430, labored zealously to restore peace to the Church. In 411 he held a conference with 279 of their bishops at Carthage. The sect early began to split up into independent smaller sects, and they disappeared from the page of history after the Vandal invasion in 429.

Donatus, dō-nā'tŭs, **Ælius**, Roman grammarian and commentator who lived in the 4th century. He wrote an elementary work on the Latin language, 'De octo partibus orationis,' which served as a guide to the learning of Latin in the Middle Ages, and formed the groundwork of most elementary treatises until recent times. It was one of the books most frequently printed at the commencement of the art, several editions having been issued from blocks even before the invention of types.

Donau, dō'now. See DANUBE.

Donauwörth, dō'now-vĕrt, Germany, a walled town of Bavaria, at the junction of the Wörnitz and Danube, about 25 miles north by west of Augsburg. The monthly live stock market is a source of wealth to the town. Pop. 4,083.

Don'caster, England, a municipal borough in the West Riding of Yorkshire on the Don. It has long been famous for its annual races, begun in 1703. Nearby are the ruins of Conisborough Castle, the stronghold of Athelstan in Scott's 'Ivanhoe.' Pop. (1900) 25,000.

Dondo, dŏn'dō, West Africa, a town of Angola situated at the head of navigation on the Coanza River, and not far from the Loanda Railway. It has a considerable caravan trade and is an import coffee market. Pop. 3,000.

Dondrah (dŏn'dra) or **Dondera Head**, the southern extremity of the island of Ceylon, a steep and rugged promontory, formerly the site of a temple.

Donegal, dŏn'e-gal, county in the province of Ulster, Ireland; area, 1,100,200. About one half is good farming land, but the mountainous districts are rich in minerals. Pearl-mussels abound in the rivers. Pop. 185,635.

Don'elson, Andrew Jackson, American diplomatist; b. near Nashville, Tenn., 25 Aug. 1800; d. Memphis, Tenn., 26 June 1871. He was graduated at the United States Military Academy in 1820, and entered the army as a lieutenant of engineers. In 1822 he resigned, studied law, and also engaged in cotton raising in his native State. He filled a number of responsible offices; was private secretary to President Jackson in 1829–30; minister plenipotentiary to Prussia, and later to Germany, in 1846–9; was editor of the Washington *Union* in 1851–2; was candidate of the American party for Vice-President in 1856; and after his defeat retired to private life.

Donetz, dō-nyĕts', or **Severnoi Donetz,** a river in Russia which, rising in the government of Kursk, flows almost due south about 400 miles into the Don.

Don'gan, Thomas, Earl of Limerick, English colonial official; b. Castleton, Ireland, 1634; d. London, 14 Dec. 1715. After serving in the British and French armies he was appointed colonial governor of New York by the Duke of York in 1682. He gave the city of New York its first charter in 1686 and being accused of ignoring his pacific instructions regarding the French and Indians, and of inciting the Five Nations to war, resigned his commission in 1688, returned to England in 1691, succeeding to the earldom of Limerick in 1698.

Dongola, dŏng'gō-lā, a province of Nubia, in Africa. The chief town of this district is of the same name. Pop. about 6,000.

Dongola Kid. See Leather.

Don'iphan, Alexander William, American military officer; b. Mason County, Ky., 9 July 1808; d. Richmond, Mo., 8 Aug. 1887. He began the practice of law in 1830 in Lexington, Mo. He was three times elected to the Missouri legislature. He served in the Mexican war, in which he made a brilliant record, capturing Chihuahua after an unexpected encounter with an army of 4,000 men. He was one of the peace commissioners at the convention which met at Washington previous to the Civil War.

Donizetti, Gaetano, gä-ā-tä'nō dō-nē-dzĕt'-tē, Italian composer; b. Bergamo 25 Nov. 1797; d. there 8 April 1848. He studied music at Bologna under the distinguished Abbé Mattei. His first opera, 'Enrico di Borgogna,' was represented at Venice in 1818. In 1822 his 'Zoraïde di Granata' gained him the honor of being crowned on the capitol. In 1830 appeared his 'Anna Bolena,' which first, with 'Lucrezia Borgia' and 'Lucia di Lammermoor,' the latter his masterpiece, acquired for him a European fame. In 1835 Donizetti was appointed professor of counterpoint at the Royal College of Naples, but removed in 1840 to Paris, bringing with him three new operas, 'Les Martyrs,' 'La Favorita,' and 'La Fille du Régiment,' of which the last two are among his most popular productions. Of his other operas none except 'Linda di Chamouni' (1842) and 'Don Pasquale' (1843) achieved any special triumph. See Ferris, 'Great Musical Composers' (1887).

Donjon, dŭn'jŭn or dŏn'jŏn (Lat. *dominus* lord, changed to mean master or lord over), the grand or principal or commanding tower or keep of a mediæval castle, frequently raised on an artificial elevation. It was the strongest portion of the building, usually detached from the surrounding buildings. The donjon contained the great hall and principal rooms of state for solemn occasions, and also the prison fortress; from the last is derived the word dungeon.

Donkey. See Ass.

Donkey Engine, a small auxiliary steam-engine in a ship, not used for propelling but to assist in performing various operations where no great power is required. Thus a donkey engine is often stationed on the deck of a ship to work a crane for loading and unloading.

Don'levy, Harriet Farley, American editor and author; b. Claremont, N. H., 18 Feb. 1817. She was educated as a teacher, but abandoned this pursuit and worked in cotton mills at Lowell. From 1840 to 1848 she edited a mill-girls' magazine, 'The Lowell Offering,' acting as contributor, editor and publisher of the 'New England Offering,' with which she was connected till 1850. She married John Intaglio Donlevy in 1854, who died 1872. Among her works are: 'Shells from the Strand of the Sea of Genius,' reprints from 'Lowell Offering' (1847); 'Happy Hours at Hazel Nook' (1852); 'Christmas Stories'; 'Mind Among the Spindles,' London (1849); also a reprint from the 'Lowell Offering.'

Donne, dŏn, **John,** D.D., English poet and divine; b. London 1573; d. there 31 March 1631. His parents were Roman Catholics, but in his 19th year he abjured that religion, and became secretary to the Lord-chancellor Egerton. He continued in that capacity five years, but finally lost his office by a clandestine marriage with his patron's niece. He subsequently took orders by the desire of King James, and was soon after made one of his chaplains. In 1621 he was appointed dean of St. Paul's. He was chosen prolocutor to the convocation in 1623–4; and, in consequence of a dangerous illness, soon after wrote a religious work, entitled 'Devotions upon Emergent Occasions.' As a poet, and the precursor of Cowley, Donne may be deemed the founder of what Dr. Johnson calls the metaphysical class of poets. Abounding in thought this school generally neglected versification, and that of Donne was peculiarly harsh and unmusical. He wrote Latin verse with much elegance. A collection of his Latin poems was published in 1633. Of his prose works, one of the most remarkable is that entitled, 'Biathanatos,' to prove that suicide is not necessarily sinful, which he never published himself, but which found its way to the press after his death. His style is quaint and pedantic; but he displays sound learning, deep thinking, and originality of manner. Besides the works already mentioned, he wrote the 'Pseudo-Martyr' (1610), letters, sermons, etc. See Gosse, 'Life and Letters of John Donne' (1899); Jessop, 'John Donne' (1897).

Don'nelly, Eleanor Cecilia, American author; b. Philadelphia, Pa., 6 Sept. 1838. She is a sister of Ignatius Donnelly (q.v.). Among her many volumes of verse are: 'Out of Sweet Solitude'; 'Domus Dei'; 'Legend of the Best

Beloved and Other Poems'; 'Crowned with Stars'; 'Hymn of the Sacred Heart'; 'Children of the Golden Sheaf and other Poems.' She has also written several prose works, including 'Life of Father Felix.'

Donnelly, Ignatius, American prose writer: b. Philadelphia, 3 Nov. 1831; d. Minneapolis, Minn., 2 Jan. 1901. He was prominent in Minnesota politics, but was best known as an author. Among his writings are: An 'Essay on the Sonnets of Shakespeare'; 'Atlantis, the Antediluvian World' (1882); and 'Ragnarök' (1883). In 'The Great Cryptogram' he endeavors to prove that Francis Bacon was the author of Shakespeare's plays. His best-known novel is 'Cæsar's Column.'

Donner, Georg Raphael, gā'ôrg rā'fä-ĕl dŏn'nĕr, Austrian sculptor: b. Essling, Austria, 25 May 1692; d. Vienna 15 Feb. 1741. He studied at the Vienna Academy of Architecture, and was employed at the imperial court, and also by Prince Esterhazy. Among his best works are the fountains on the Mehlmarkt, and at the city hall, Vienna, and a statue of Charles VI.

Don'nybrook, Ireland, a village now forming part of Pembroke township, in the county of and two miles southeast of Dublin. It is famous for its fairs, now abolished, which used to attract vast multitudes of persons, and seldom passed off without riot and bloodshed.

Donoghue, John, American sculptor: b. Chicago, Ill., 1857; d. New Haven, Conn., July 1903. He won a first prize over many competitors at the Chicago Fair for a classical group, 'Sophocles Leading the Chorus After the Battle of Salamis.' He designed the 'St. Paul' in the Congressional Library in Washington, the 'St. Louis of France' of the Appellate Division building in New York, and busts of Gov. Ames and John Boyle O'Reilly in the Boston Public Library. Other works were his 'Venus,' and 'Diana,' and best known of all, his 'Egyptian Ibis.'

Don't Worry Circles, associations formed in New York in the winter of 1897–8 from suggestions in 'Don't Worry: The Spiritual Law of Happiness,' published by Theodore F. Seward. The rules given for conquering the habit of worrying are based upon religious faith, common-sense and a spirit of helpfulness. For a time Washington was the centre of the movement.

Do'nus, Pope from 676 to 678. He is known as a patron of architecture, and adorned many of the churches of Rome; he also compelled the archbishop of Ravenna to recognize his authority. Sometimes a Donus II. is recorded as Pope for a short time in 974, but this is recognized as a mistake, due to an error of a copyist.

Doo, George Thomas, English line-engraver: b. Christ Church, Surrey, 6 Jan. 1800; d. Sutton, Surrey, 13 Nov. 1880. He made himself best known by his famous plates of 'Knox Preaching,' after Wilkie; of Eastlake's 'Italian Pilgrims Coming in Sight of Rome'; by his exquisitely finished heads of women and children, after Lawrence; and by his engravings from Raphael, Correggio, and others. His plate of the Calmady Children, titled 'Nature,' after Lawrence, produced in 1830, ranks as his masterpiece. In 1851 he was elected a Fellow of the Royal Society; in 1857 an academician. About 1853–5 he painted in oils, his works of this class being mainly portraits. In 1864 he completed, after eight years' work, a large engraving of the 'Raising of Lazarus,' by Sebastian del Piombo, his last important work.

Dooley, Mr. See DUNNE, FINLEY PETER.

Doolittle, Charles Camp, American soldier: b. Burlington, Vt., 16 March 1832. He entered the volunteer service during the Civil War, becoming colonel in 1862. He led a brigade at Nashville; and was commander of the northern district of Louisiana in 1865. In June, 1865, he was made major-general of volunteers, and was mustered out of service in November of the same year. He moved to Toledo, Ohio, where he was cashier of the Merchants' National Bank.

Doom, the old name for the "Last Judgment," a subject usually chosen for paintings over the chancel arch in parochial churches in England. Dooms were executed in distemper, and are of constant occurrence. In the reign of Edward VI. these representations were effaced, or washed over, as superstitious.

Doom Palm, or Doum Palm, a palm-tree, *Hyphæne thebaica,* whose branches terminate in a tuft of large fan-shaped leaves. The fruit is about the size of an apple; it has a fibrous mealy rind, which tastes like gingerbread (whence the name gingerbread-tree sometimes applied to this palm), and is eaten by the poorer inhabitants of Upper Egypt, where it grows. An infusion of the rind is also used as a cooling drink in fevers. The seed is horny, and is made into small ornaments. Ropes are made of the fibres of the leaf-stalks.

Doomsday or Domesday Book, the record of a statistical survey of England, made by royal authority in the reign of William the Conqueror. The origin of the name has been much disputed. Popularly it has often been associated with the final day of judgment. There was a doom-book or dom-boc (q.v.) composed in the reign of King Alfred, which contained a collection of the laws and customs of the kingdom; and the doomsday book is conjectured to have taken its name from the fact of its containing the authoritative data on which legal decisions in regard to land and other collateral property were to be given. The general survey of the kingdom was ordered at Christmas 1085, and completed in the following year. It was made by commissioners appointed by the king, who collected the particulars at inquests from a sworn jury, consisting of sheriffs, lords of manors, presbyters, bailiffs, villains; all the classes, in short, interested in the matter. The information collected consisted in specifications of the extent of land in each district, their proprietors, tenure, and value; the state of culture, namely, the quantity of meadow, pasture, wood, and arable land; in some counties the number of tenants, villains, *cotarii* and *servi;* even the sheep and cattle on the different estates were taken, but these were not entered in the permanent record. Northumberland and Durham were omitted, and the northern part of Cumberland and of Westmoreland. The original 'Domesday Book' is preserved in the record office. It consists of

two volumes; one folio, one quarto. The republication of this valuable record was undertaken in 1707 and completed in 1783. Perfect facsimiles of the whole book in photozincography have also been made.

Doon, a river in Ayrshire, Scotland, which after a course of 30 miles flows into the Firth of Clyde. It is celebrated in the poems of Burns.

Door, a wooden or metal, sometimes stone frame or panel constructed to open and shut on hinges; used for entrances to buildings, rooms, etc. Sometimes made of one piece, but generally of several sections framed together. The doors of ancient Egypt and kindred countries swung upon vertical pintles which projected from the top and bottom of the door into sockets above and below. In China and other eastern countries doors may be seen today swinging on pivots. In modern carpentry, doors are classified under two general heads: batten-doors and panel-doors. The former are made of two or more boards placed longitudinally and held together by transverse rails. The latter are formed of a skeleton frame work into which is fitted lengths of thin board called panels. Folding and sliding doors have been improvements upon the hinge variety, working on tracks or grooves and having the particular value of economizing space.

Door'ga, in Hindu mythology the principal wife of Siva, one of the gods belonging to the Hindu triad. In Bengal the name Doorga is her appropriate appellation, and was given her by transference from the giant Doorga whom she slew. In southern and western India she is called Purwutee, or Parvati.

Doorn, a common name in South Africa. It indicates various communes in the Cape Colony. It also designates two rivers, in Africa, distinguished as Great and Little Doorn.

Doorn'boom (*Acacia horrida*), a tree common in South Africa. The name "thorn-tree," given to it by the Dutch colonists, and the botanical specific name, are due to the number and sharpness of its spines. It seldom much exceeds 30 feet in height, but its timber is hard and tough, and is much used for house-carpentry, etc. See ACACIA.

Dope (from Dutch *doop*, sauce) is a descriptive term meaning any thick liquid like molasses; a thick sauce or gruel or other viscous fluid or pasty thing used for eating is called a dope. Also a thick pasty lubricant like axle-grease. Fillers used in painting to fill the pores of the wood and prevent the absorption of the paint or varnish subsequently applied to the wood. A preparation of pitch, tallow and other ingredients which, when applied to the bottoms of shoes, will enable the wearer to lightly glide over softened snow. Any absorbent material, as cotton-waste for holding axle-grease or kieselguhr for holding nitro-glycerine. A stupefying substance like opium or chloral hydrate. For dynamite dopes see EXPLOSIVES.

Dop'pler, Christian, Austrian mathematician and physicist: b. Salzburg, Austria, 30 Nov. 1803; d. 17 March 1853. He was professor of mathematics at Prague 1841–7, and at Vienna held a similar post in the Polytechnikum 1848–51. For the last two years of his life he was director of the physical institute at Vienna University. He published: 'Ueber das farbige Licht der Doppelsterne' (1842); 'Versuch einer systematischen Klassification der Farben' (1848); etc., and made known the noted "Doppler's Principle" (q.v.).

Doppler's Principle, a name given to the physical law (first enunciated in 1842 by Christian Doppler of Prague,) that the apparent wave-length of sound or light depends upon the velocities of the observer and of the source from which the radiation proceeds. For the sake of illustration, let the source of the radiation be stationary with respect to the medium that transmits the waves, and let the velocity of the waves in this medium be V. If N is the number of waves of a certain definite wave-length that the source emits every second, then the observer will also receive N of these waves every second, provided he remains stationary. If the observer is moving, however, the case is different. For example, suppose that he is receding from the source of the radiation with a uniform velocity v, and consider what happens in the course of a single second. During this second N waves reach his initial position, just as before; but at the end of the second he is v units of distance beyond that initial position, and hence it is impossible that all of these N waves can have reached him. The deficit will evidently be equal to the number of waves whose combined lengths would just measure v. But the source sends out N waves every second, and when the last of these N is just leaving the source, the first one of the series has proceeded to a distance V. Hence we know that the length of one wave is $\frac{V}{N}$; and to find the number of waves that would be required to fill the distance v, we have only to divide v by the length of a single wave; that is, we have to divide it by $\frac{V}{N}$. Hence the observer's motion will diminish the number of waves that reach him every second by $\frac{Nv}{V}$, and, therefore, when he is receding from the source with the velocity v, he will receive only $N - \frac{Nv}{V}$, or $\frac{N(V-v)}{V}$, waves per second. The result will be, that the wave-length of the sound (or light) will appear to him to be longer than it really is. The same line of reasoning will show that if the observer is stationary and the source is receding with a velocity v, the number of waves that the observer will receive per second will be $\frac{NV}{V+v}$. If the motion is such as to diminish the distance instead of increasing it, the algebraic sign of v must be reversed in the foregoing formulæ. The most familiar example of Doppler's principle is afforded by the sudden change in the apparent pitch of a sounding bell or whistle on an express train moving at high speed. If the observer stands close to the track, the pitch falls suddenly and very markedly, as the locomotive passes him. The most important applications of the principle, however, are in astronomy, in connection with the mea-

surement of the velocities of the celestial bodies, by observing the displacement that their motion produces in the positions of the lines of their spectra. (See SPECTROSCOPE.) If the earth is approaching a heavenly body, the lines in the spectrum of that body are all shifted slightly toward the violet end, owing to the apparent shortening of each wave-length by the motion. If the earth and the heavenly body are receding from each other, there is a similar displacement of the lines toward the red end. The rotation of Saturn's rings has been experimentally demonstrated in this way, and the velocities of approach and recession of many of the brighter fixed stars have also been determined. Certain stars have been demonstrated to be double, by the discovery that the lines of their spectra are periodically double and single; the lines appearing single when the relative motion of the two components is perpendicular to the line of sight, and double when the positions of the component stars are such that one star is approaching the earth while the other is receding from it. The orbits of certain of these stars have been determined by such measurements, even when the components of the systems are so close together that no telescope can show them separately, nor make them appear otherwise than as a single point of light.

Dop'plerite (named after B. Doppler, the first to bring it to notice), an amorphous mineral occurring in elastic or partly jelly-like masses found in peat-beds in Styria and Switzerland, and regarded as a fossil peat. When fresh it is a brownish-black, with a dull brown streak and greasy subvitreous lustre, insoluble in alcohol or ether. Dopplerite is also the name of a related mineral, grayish, earthy, and plastic in the fingers when fresh.

Dor, or Bongo (q.v.), the names given to a mixed tribe of negroes living in Central Africa, in the lowlands of the Bahr-el-Ghazal, eastern Sudan. The race is of medium size, attaining splendid muscular development. Their skin is red-brown. They are noted for remarkable productions in iron and wood work.

Dor, or Dorr, a species of beetle, belonging to the family of earth-borers. It is of a glossy violet, black, or deep greenish-black. The club of the antennæ is yellowish, the elytra smooth, but slightly punctated, as is the thorax. It may often be seen flying about in the summer evenings. Its size and weight render it very unwieldy on the wing, so that it has but little power of guiding itself, and apparently none of checking its course quickly, for it strikes against all kinds of objects, but without suffering any damage. The female lays its eggs in patches of cow-dung. It is about an inch long. It is also called dor- or dorr-beetle, dorfly, and buzzard-fly.

Dor, or Mont Dore, môñ' dōr (often written Mont d'Or), a chain of mountains in France belonging to the group of the Auvergne Mountains, in the department of Puy-de-Dôme. They are of volcanic formation. The Puy-de-Sancy, the highest peak of central France, is 6,190 feet.

Dora d'Istria, dō'rä dēs'trē-ä, pseudonym of ELENA GHICA, Rumanian author: b. Bucharest 22 Jan. 1829; d. Florence, Italy, 20 Nov. 1888. She married the Russian Prince Kolzow-Massalsky. Her first work, 'Monastic Life in the Eastern Church,' alleges monasticism to be the principal obstacle to civilization in eastern and southern Europe. Her other works include: 'German Switzerland'; 'Women in the East'; 'Women, by a Woman.' She contributed many literary and historical essays to German, Italian, French, and Greek periodicals. Her studies on Albanian poetry gave rise to a nationalistic and literary movement among the Albanians. The Greek Chamber of Deputies, in April 1868, named her "high citizeness of Greece."

Doran, John, English essayist and critic: b. London 1807; d. there 28 Jan. 1878. He wrote: 'The Wandering Jew,' when he was 17, and the Surrey theatre staged it. His maturer performances, 'Table Traits and Something on Them' (1854); 'New Pictures and Old Panels' (1859); and a 'History of Court Fools' (1858), have merit.

Dorat, Claude Joseph, klōd zhō'zĕf dō-rä, French poet: b. Paris 31 Dec. 1734; d. there 29 April 1780. He renounced the study of law, and afterward the military service, into which he had entered as a musketeer, and devoted himself entirely to poetry. He wrote numerous dramas which were unsuccessful. He has succeeded better in songs, tales, and poetical epistles, but though he had great facility in composition, his works are not much esteemed. Dorat's works appeared in Paris complete in 20 volumes (1786).

Dorcas Gazelle, the best known of the genus of gazelles, very common in northern Africa, Asia Minor, Arabia, and Syria. It attains a height of two feet; has tapering ringed horns from 9 to 10 inches long; and is of a tawny color with white under parts. It is noted for its speed, is naturally very wild, but easily becomes domesticated, and owing to its beauty and gracefulness is frequently alluded to in Oriental poetry. Its name is derived from the Greek *δορκάς*, through *δέρκεσθαι*, to look, owing to the size and brightness of its eyes.

Dorcas Society, the name given to an association of ladies who make or provide clothes for needy families, distributing the garments free or at a nominal cost. The name is taken from Acts ix. 39: "And all the widows stood by him weeping, and showing the coats and garments which Dorcas made, while she was with them."

Dor'chester, Daniel, American Methodist clergyman: b. Duxbury, Mass., 11 March 1727. He was educated at Wesleyan University and entered the Methodist ministry in which he has been prominent as pastor and presiding elder. He has been at various times a member of the Connecticut Senate and the Massachusetts House of Representatives, and has published: 'Concessions of Liberalists to Orthodoxy' (1878); 'Problem of Religious Progress' (1881); 'Latest Drink Sophistries versus Total Abstinence' (1883); 'The Liquor Problem in All Ages' (1884); 'The Why of Methodism' (1887); 'Christianity in the United States' (1888).

Dorchester (ancient Roman DURNOVARIA or DURINUM), England, a municipal borough, the county town of Dorsetshire. In March, 1645, Cromwell held the town as his headquarters

with 4,000 men, and in 1685 Judge Jeffreys held his "bloody assize" here, when 292 received sentence of death as being implicated in Monmouth's Rebellion. A Roman amphitheatre, in a good state of preservation, is near the town.

Dorchester, Mass., since 1870 one of the wards of the city of Boston. Dorchester, originally called Mattapan, was settled in 1630 by the Puritans, but the name was soon changed to Dorchester in memory of the English home of some of the settlers. It was by fortifying Dorchester Heights in March 1776 that Washington forced the evacuation of Boston by the British army. The place is noted as the birthplace of Edward Everett. The population is counted as a part of that of Boston.

Dorchester, New Brunswick, town, county-seat of Westmoreland County; at the junction where two small rivers enter Shepody Bay; and on the Intercolonial R.R. The industries are principally ship-building and nearby quarrying. Pop. (1902) 7,105.

Dorchester Heights, now **South Boston,** Mass. This hill on the peninsula, southeast of Boston proper, across a navigable channel, commands the city; and in the Revolution, when Boston was held by Howe in the winter of 1775–6, it was obviously of the first importance to fortify it. Howe neglected to do so, and on the evening of 4 March 1776, under Washington's orders, Gen. John Thomas, with some 2,500 men and the proper implements, took possession of the heights, and by the next morning a sufficient entrenchment had been thrown up. Howe promptly agreed to evacuate Boston if unmolested, and did so on the 17th, leaving all his guns and supplies unharmed for the Americans.

Dordogne, dōr-dōn-yė, a department of France which includes the greater part of the ancient province of Périgord, and small portions of Limousin, Angoumois, and Saintonge. It lies between Haute-Vienne on the north, Carreze and Lot on the east, Lot-et-Garonne on the south, and Charente, Charente-Inférieure, and Gironde on the west. Area, 3,550 square miles, of which about a third is fit for the plow. The chief minerals are iron, which is abundant, slate, limestone, marble, and other stone. Mining, iron manufacture, etc., are carried on to a considerable extent, and there are a number of vineyards. Also noted for its production of wines and truffles. The climate is mild, but somewhat changeable. Pop. (1901) 452,951. The river Dordogne, principal river of the department, rises on the flanks of the Puy-de-Sancy, flows west-southwest, and after a course of 200 miles unites with the Garonne in forming the Gironde.

Dordogne, a river of France, rising near Mt. Dore and flowing west for 305 miles, uniting with the Garonne about 15 miles north of Bordeaux. The river is navigable for steamers for nearly 190 miles.

Dordrecht, dōr'drĕnt. See DORT.

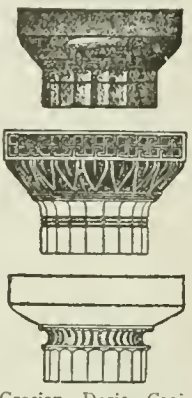
Doré, Paul Gustave, pōl güs-tāv dō-rā, French artist: b. Strasburg 6 Jan. 1833; d. Paris 23 Jan. 1883. In 1845 he was sent to the Lycée Charlemagne at Paris, and three years later his early developed skill as a designer and draughtsman of humorous and satirical subjects gained him a place among the illustrators of the 'Journal pour Rire.' From 1848 to 1853 he contributed to the Salon a series of pen drawings, such as 'Les Pins Sauvages'; 'Le Lende maundes Orages'; 'La Prairie'; etc., which attracted much attention. In 1857 he had honorable mention for landscapes and a picture of the battle of Inkerman. His productivity was extraordinary, and embraced almost all classes of subjects. He is best known in England as the illustrator of the Bible, 'Don Quixote,' and of the works of Dante, Milton, and Tennyson ('Idylls of the Kings'). He also illustrated Rabelais and works by Chateaubriand, Balzac, and other writers. As a painter he was less successful than as an illustrator of books. His works of this class were 'Paolo and Francesca da Rimini' (1863); 'The Neophyte' (1868), and 'Christ's Entry into Jerusalem' (1876).

Dore'mus, Robert Ogden, American chemist: b. New York 11 Jan. 1824; d. New York City, 22 March 1906. He was graduated at New York University in 1842, and from its medical department in 1850, having established his chemical laboratory in New York in 1848. He filled the chair of chemistry at Bellevue Hospital Medical College and at the College of the City of New York. He patented noted chemical processes and fire extinguishers and was a noted expert in toxicology.

Doremus, Sarah Platt Haines, American philanthropist: b. New York 3 Aug. 1802; d. there 29 Jan. 1877. She was married to Thomas C. Doremus in 1821. With several others she organized the Greek Relief Society in 1828, and with Catharine Sedgwick established in 1842 a Home for Women from Prison, since known as the Isaac T. Hopper Home. She assisted in founding the House and School of Industry and was officially connected with various benevolent institutions, besides working for a half century in behalf of foreign missions. During the Civil War she labored for sick and wounded soldiers, both North and South.

Doria, dō'rē-ā, one of the most powerful families of Genoa. It became distinguished about the beginning of the 12th century, and shared with the families Fieschi, Grimaldi, and Spinola the early government of the republic. These four were known as *Magnæ quatuor prosapiæ*, the four great families of this republic. The Dorias and the Spinolas belonged to the Ghibelline, the Fieschi and the Grimaldi to the Guelph faction; but as this division does not exhaust the combinations of which the number four is capable, the two distinct sections entertained their own private jealousies and quarreled among themselves, Guelph with Guelph and Ghibelline with Ghibelline, making, as it were, a bear-garden of the dark and deep streets of their formidable city.

Doria, Andrea, ān drā'ā, Genoese admiral: b. Oneglia 30 Nov. 1468; d. Genoa 15 Nov. 1560. He entered the Pope's guards and afterward passed into the service of the Duke of Calabria, who commanded in Italy for the king of Aragon. He was rapidly promoted, and Alphonso II. gave him a command against Ludovico Sforza, Duke of Milan. When the French had left Italy the Genoese entrusted the reconstruction of their fleet to Doria. He was first employed in suppressing the African pirates, from



whom he captured a large booty, but was soon after exiled, and entered the service of Francis I., who named him admiral of the French galleys. Displeased with some demands of the French king, who in answer to his complaints deposed him from his command, he entered the service of Charles V. in 1528. His defection proved disastrous to the French cause in Italy. He occupied Genoa without resistance on 12 Sept. 1528, and his further successes contributed to the re-establishment of peace. He re-established order in Genoa, and organized the government on a new basis, which became permanent during the independence of the republic. Charles bestowed on him the highest honors, and received in exchange the most important services. In 1532 he took Koron and Patras, in Greece, from the Turks, and in 1535 assisted in the capture of Tunis. He assisted next year in a descent on Provence, took Toulon, and ravaged the coasts of the Gulf of Lyons. The emperor and the king of France had afterward an interview, which has become historical, on board his galley, with a view to the conclusion of peace. This interview took place at Aigues-Mortes in July 1538. In 1547 he narrowly escaped assassination in a conspiracy raised in Genoa by the Fieschi. His nephew was killed in this conspiracy, which excited him to some severities approaching to the barbarity of earlier times. Doria has been accused, probably with justice, of selling his sword too freely, and to too many opposing interests; but his services to his country have earned him the titles of *father* and *liberator*, which were conferred on him, together with the censorship for life, by the Genoese senate in 1528.

Do'rian Mode, the standard Greek and ecclesiastical mode, the first of the authentic church tones or modes, from D to D, with its dominant note of A. It resembles the key of D minor, but with the B natural and no C sharp. It is characterized by its severe and austere progressions, and is especially adapted to religious or warlike music. Many of the old German chorals are written in this mode.

Dorians, one of the four great branches of the Greek nation. They derive their name, according to legend, from Dorus, the son of Hellen. They dwelt first in Histiæotis, were then driven by the Perrhæbi into Macedonia, forced their way into Crete, where the lawgiver Minos sprang from them, built the four Dorian towns (Dorica Tetrapolis) at the foot of Mount Œta, between Thessaly, Ætolia, Locris, and Phocis, and subsequently, together with the Heraclidæ, made a settlement in the Peloponnesus, where they ruled in Sparta. Colonies emigrated from them to Italy, Sicily, and Asia Minor. The Dorians were in many ways the reverse of the Ionians. The Doric manner always retained the antique style, and with it something solid and grave, but at the same time hard and rough. The Doric dialect was broad and rough; the Ionic, delicate and smooth; it was the form made use of in solemn odes, for example, in hymns and in choruses forming part of the national celebrations, and the acting of the drama at Athens. The Cretan and Spartan legislative codes of Minos and Lycurgus were much more rigid than the mild Athenian institutions of Solon. The Spartan women wore the light tucked-up hunting-dress, while the Ionian females arrayed themselves in long sweeping garments. Both have been idealized by artists: the one in Artemis and her nymphs, the other in Pallas Athene and the Canephoræ. The same contrast appears no less strikingly in their architecture, in the strong, unadorned Doric, and the slender, elegant Ionian columns. See Müller, 'Die Dorier'; Grote, 'History of Greece.'

Dor'ic Order, in architecture, the second of the five orders, being that between the Tuscan and Ionic.

Grecian Doric.—The Doric column was first adapted to edifices having the proportions, strength, and beauty of the body of a man. The trunks of trees probably suggested the first idea of columns, but in the Doric style the proportions of a man appear to have been adopted. A man was found to be six times the length of his foot, hence the plain Doric columns were made six diameters in height. From the middle of the 7th century to the end of the 6th century B.C., the Doric appears to have been the only style of architecture used by the Greeks, and its highest example is the Parthenon of Athens.

Grecian Doric Capitals. 1, plain; 2, jointed; 3, at temple of Ceres in Paestrum.

Roman Doric.—An imitation of the Grecian, with a true Greek entablature and a molded base. The column is slenderer than that found in the best Greek examples, and is possibly of Etruscan proportions.

Dorigny, Louis, loo-ē dō-rēn-yē, French engraver: b. 1654; d. Verona, Italy, 1742. He with a son of Michael Dorigny (q.v.). He entered the school of Lebrun, and made a journey to Italy, where he copied the great masters.

Dorigny, Michel, mē-shel, French painter and engraver: b. St. Quentin 1617; d. Paris 1665. He was a scholar of Simon Vouet, whose works he etched, and whose faults in drawing he copied. His style of execution is bold, and his management of light and shade good. He became professor in the Academy at Paris.

Dorigny, Sir Nicholas, French engraver: b. Paris 1658; d. 1746. He was a son of Michael Dorigny (q.v.). He spent 28 years in Italy in studying the most illustrious masters, and 8 in engraving the famous cartoons of Raphael, at Hampton Court, for which he received the honor of knighthood from King George I. In 1725 he became a member of the Academy at Paris. One of his best engravings, besides his cartoons is the 'Transfiguration,' from Raphael, and the 'Apotheosis of St. Petronilla,' after Guercino. His engraving is easy and strong, and the work of the needle and the graver happily united.

Do'rion, Sir Antoine Aimé, Canadian jurist: b. St. Anne de la Perade, P. Q., 17 Jan. 1818; d. 3 May 1891. He was called to the bar in 1842 and became chief justice of the Province of Quebec in 1874. He held various cabinet positions and was knighted in 1877. During his

political career he was the leader of the French-Canadian Liberal party of the Province of Quebec.

Do'ris, a small mountainous district of ancient Hellas, was the home of the Dorians (q.v.). It is now a part of the modern government of Phocis. Doris was also the name of a district in Asia Minor on the coast of Caria, inhabited by colonists from the Peloponnesus.

Doris, in mythology. See NEREUS.

Doris, in natural history. See SEA-LEMON.

Dor'king, England, town in Surrey, 22 miles southwest of London, noted for its breed of fowls. It is the scene of the fictitious 'Battle of Dorking.'

Dorking, a fowl. See POULTRY.

Dormant Partner, a commercial term, almost obsolete to-day, having given way to the more familiar expression silent partner (q.v.).

Dormant State. See HIBERNATION.

Dormer Window (Old French *dormeor*, a sleeping-room), a vertical window usually flush with the wall of the house and standing in a projection built out to receive it from a sloping roof. In ordinary house-building serves as an ornament and at the same time lighting and enlarging an attic chamber. Very picturesquely used throughout France, Belgium and the Netherlands. In Gothic and Renaissance architecture the dormer window effect was often employed on beautiful stone edifices.

Dormitory (Fr. *dormitoire*, from Lat. *dormire*, "to sleep"), formerly in a monastery or nunnery sleeping quarters either divided into cells or cubicles, opening upon a corridor, or one great apartment divided by partitions or curtains. In connection with American colleges and similar institutions the dormitory is often an entire building divided into bed-rooms.

Dormouse, the common name given to the family *Myoxidæ*, natives of the Old World. They are pretty little creatures, with soft, fine fur, and long, squirrel-like tails; but, unlike the squirrels, which they somewhat resemble in habits, they have no cheek-pouches. There are in all four genera of the *Myoxidæ*, containing about a dozen species, the best known of which is the red dormouse, "hazel mouse," or "muscardine" (*Muscardinus avellanarius*), which lives in the woods in most parts of Europe. It is about the size of the common house mouse; has a rather large head, a pointed muzzle, large, prominent eyes, and a hairy tail. It is reddish in color above, and white below. Its food consists of acorns, nuts (especially hazel nuts), and grain; which it stores for winter use, much as squirrels do. In the coldest weeks of winter it curls up and sleeps, waking, however, at intervals, in milder days, to feed upon its gathered stores. Its nest is usually made of tangles of herbage, with an opening at the top, and hidden in the underbrush. The fat dormouse (*Myoxis glis*) is larger than the red dormouse, and duller in coloring. It inhabits the forests of southern Europe, where it may be found leaping with remarkable agility from tree to tree. The garden dormouse (*Eliomys nitela*) lives nearer to man, being found in gardens, and often in barns. It destroys fruit grown along walls and trellises. The French call it "lerot"; the Germans "Gartenschlafer."

Dorner, dôr'nĕr, Isaak August, German Protestant theologian; b. near Tuttlingen, Würtemberg, 20 June 1809; d. Berlin, 8 July 1884. He studied theology and philosophy at Tübingen; and had already filled chairs at Tübingen, Kiel, Königsberg, Bonn, and Göttingen, when in 1801 he was called to be professor at Berlin. His greatest work is the 'History of the Development of the Doctrine of the Person of Christ' (1801–03). Among his other works are 'History of Protestant Theology' (1871); 'System of Christian Doctrine' (1880–4); 'Christian Ethics' (1887).

Dor'nick, a species of coarse, figured linen, named from Tournai or Doornick in Flanders. The manufacture introduced into England by the Dutch who fled from the persecutions of Alva was long confined by law to inhabitants of Norwich and Pulham. A similar cloth called dornock was made at Dornock, Scotland.

Dornoch (dôr'nŏk) **Firth**, an arm of the sea, on the east coast of Scotland. The town of Dornoch is near the entrance. Fishing is valuable, but navigation is difficult.

Dornock. See DORNICK.

Dorohoi, dō-rō-hoi', Rumania, a town in the northwest of Moldavia, near the Austrian frontier. Pop. 15,000, half being Jews.

Dorpat, dôr'pät, or **Dörpt** (Lettish, *Tehrpat*), Russia, city in the government of Livonia, on the Embach, about 135 miles northeast of Riga. Dorpat is chiefly remarkable for its university, which was founded in 1632 by Gustavus Adolphus, when the Swedes were masters; it was suppressed, in 1656, by the Muscovites; and re-established by the Emperor Alexander, in 1802–3. To this institution is attached an observatory, which the labors of Dr. Struve have made famous, and a library with about 300,000 volumes. Pop. 45,000.

Dorr, Julia Caroline (RIPLEY), American poet and prose writer; b. Charleston, S. C., 13 Feb. 1825. She removed to Vermont in 1830 where she married in 1847 S. M. Dorr, who died in 1884. Among her volumes of verse are: 'Poems' (1871); 'Friar Anselm' (1879); 'Daybreak, an Easter Poem' (1882); 'Afternoon Songs' (1885). Her prose works include: 'Lanmere' (1856); 'Sibyl Huntington' (1869); 'Expiation' (1872); 'Farmingdale' (1854); 'Bermuda,' a volume of travel (1884); 'Bride and Bridegroom, or Letters to a Young Married Couple'; 'The Flower of England's Face' (1895); 'A Cathedral Pilgrimage' (1896); 'Afterglow' (1900); 'In Kings' Houses' (1898).

Dorr, Thomas Wilson, American politician; b. Providence, R. I., 5 Nov. 1805; d. there 27 Dec. 1854. He was a member of the Assembly of Rhode Island in 1833–37, and was the leader of Dorr's Rebellion (q.v.). This was brought about by dissatisfaction with the constitution of the State; and a call for a constitutional convention was made by a party called the Suffrage Party, of which Dorr was the head. A new constitution was made by this convention and submitted to the people in 1841, receiving a majority of the votes. Dorr was convicted of high treason and sentenced to imprisonment for life, but was released under a general amnesty act in 1847, and restored to his civil rights in 1852.

Dorr Rebellion, 1840-2. Rhode Island after the Revolution continued under her charter of 1663 for nearly three quarters of a century (see CONSTITUTIONS, STATE), it being already that of a self-governing democracy. But it had two features growingly undemocratic, one of them sure to end in an explosion; the town representation in the legislature was based on 17th-century ratios of importance, since then greatly changed — thus, Newport with some 8,000 people had six members, Providence with 23,000 had four, Smithfield with 9,500 had two; and the suffrage constituted a propertied minority with primogeniture, being restricted to holders of $134 worth of real estate or $7 annual renters, and their eldest sons. Of 22,000 to 23,000 taxable polls, only 9,590 were freemen; Providence with above 23,000 inhabitants had 1,610 voters, Woonsocket with some 3,000 had 150, etc. Over $1,000,000 of personal property in Providence was unrepresented. That city was naturally the focus of discontent; Newport as naturally the champion of the established order.

From 1834 on, when he was first chosen to the legislature, the discontent was voiced by Thomas Wilson Dorr, b. 5 Nov. 1805, a lawyer of a wealthy Whig family, and a Harvard graduate. He formed something like a suffrage party organization; but it dissolved from discouragement in 1838. A convention representing only the landholders meantime threw out with only seven votes a proposition to extend the suffrage, and the Whigs smothered the agitation till after Harrison's election in the fall of 1840. Then Dorr, who had joined the Democrats, organized mass-meetings, and the suffrage became the burning question of the hour during the winter. As the legal organs of relief were packed against them by the very system against which they protested, the disfranchised had no recourse but revolution. On the claim of "natural right," they held a convention in October 1841, drafted a constitution, and called for a popular vote upon it; only their own party voted, but by fictitious lists a vote of some 14,000 was computed, about twice the actual number cast. This being a majority of the legal voters, the suffrage party proclaimed the "People's Constitution" as the lawful régime of the State, 13 Jan. 1842. Meantime the landholders' party had called a legal convention, which met in November, split into angry factions, and adjourned to 14 Feb. 1842. But the proclamation of the revolutionary constitution sobered them down; they drew up one practically as liberal as the other, and for the first time allowed those qualified under it to vote on it. The suffrage party was now offered all it claimed; but it was too much committed to its new principle of mass-rule to recede, and the "Landholders' Constitution" was voted down, 8,689 to 8,013. On 13 April the suffragists held an election under the People's Constitution, at which only their own party voted, and chose Dorr governor, with a legislature and corps of State officers. Of course all these proceedings were legally null, and the "Law and Order Party," as they called themselves, recognized them only as treasonable attempts to overturn the legal government.

At an extra session in March the legislature had made the taking of office under the Dorr government treason, and acting as moderator or clerk at their elections a serious misdemeanor; a law dubbed by the Dorr party the 'Algerine Act.' At the regular April elections Samuel W. King was chosen governor; and another extra session empowered him to proclaim martial law, and call on the federal government for the help against domestic insurrection guaranteed by the Constitution. President Tyler replied that help should be furnished when violence had actually supervened, but the government could not interfere on a mere apprehension. On 3 May Dorr and his party marched into Providence, and after debating a forcible occupation of the state-house, began legislative sessions in a disused iron foundry. They sat two days, formally repealed the "Algerine Act," demanded of Gov. King the custody of the State property, notified the federal government of their formation of the legitimate State government, etc., and adjourned to 5 July, but never met again. The regular legislature met at Newport 4 May, and the governor again appealed to the President, receiving the same answer; but the military commanders of the vicinity were ordered to keep in touch with the State authorities. Dorr went to New York and elsewhere for recruits and funds, came back on the 16th, and on the night of the 17th-18th undertook to capture the Providence arsenal, but his own men disabled his cannon and his force melted away — his chief adherents by this time being sick of the farce, when the other party were ready to grant all their demands. Dorr escaped into Connecticut (where the governor refused to give him up on requisition), and prowled around the border for several weeks, getting men and stores together — the former mainly young fellows on a "lark"; finally late in June he crossed the border, and the President decided that the time had come to order United States troops to interfere. On the 26th a crushing force marched against Dorr at Chepachet, R. I., and his men on that and the next day dispersed without waiting the event. Dorr remained in hiding for some weeks, and a reward was offered for him; in October he returned and gave himself up for trial, was convicted of high treason in March 1844, and sentenced to life imprisonment. He was pardoned in 1847, and restored to civil life in 1852. He died 27 Dec. 1854. Meantime, in November 1842, a new convention had been held by the regular authorities, adopted by the people 21–3 Nov. 1842, and became operative in May 1843. The suffrage was practically made universal. The proceedings of the state government were held legal by the United States Supreme Court in *Luther v. Borden*, argued by Webster (see his Speeches), and decided by Taney. It must be said for Dorr that but for the menace of civil war the suffrage never would have been extended; after the offer of the "Landholders' Constitution," however, he and his party became inexcusable disturbers of public order, risking bloodshed for the question of the legal theory under which the rights already obtained should be held. The great repository of material on this subject is the House Report of the 28th Congress, 1st session, No. 546; the best single summary is Francis Bowen's in the 'North American Review' (1844).

Dorrit, Amy, the "Little Dorrit" of the novel of the same name, by Charles Dickens.

D'Orsay, Alfred Guillaume Gabriel, äl'frā gē-yôm gäb-rē-ĕl dôr-sā, COMTE, French leader of fashion; b. Paris 4 Sept. 1801; d. there

4 Aug. 1852. In 1822 he became acquainted with Lord and Lady Blessington, and renounced his military career for the pleasure of their society. In 1827 he married Lord Blessington's only daughter by a first marriage, but a separation shortly followed, and Lord Blessington having died in 1829, D'Orsay returned to England with Lady Blessington, where they became the centre of a circle distinguished for art, rank, literature, and accomplishments.

Dorse, a small codfish found in the Baltic. Formerly supposed to be a distinct species (*Gadus callarias*), but now believed to be the young of the common codfish.

Dor'setshire, a maritime county of England; area, 632,272 acres. Portland stone is quarried in this county.

Dorsey, Anna Hanson, American poet, novelist, and dramatist: b. Georgetown, D. C., 12 Dec. 1815; d. Washington, D. C., 26 Dec. 1896. Some of her works were reprinted in foreign countries; among them being: 'May Brooke' (1856); and 'Oriental Pearl,' translated into German (1857). Her novels, 'Warp and Woof,' and 'Palms,' were published in 1887.

Dorsey, Ella Loraine, American author: b. Washington, D. C., 2 March 1855. She early devoted herself to journalism, serving for 10 years on the Washington papers and later in several other cities. She began her specialty of Catholic juvenile fiction in 1886. She has written much prose and verse for the magazines, and among her published books are: 'Midshipman Bob'; 'Jet, the War Mule'; 'The José Maria'; 'Saxby's Angels'; and the 'Two Tramps.'

Dorsey, James Owen, American ethnologist: b. Baltimore, Md., 31 Oct. 1848; d. Washington, D. C., 4 Feb. 1895. He was ordained a deacon in the Protestant Episcopal Church, and was engaged in parish work in Maryland from 1873–8. He was then appointed ethnologist to the United States Geological and Geographical Survey of the Rocky Mountains; and after spending some time at the Omaha Reservation in Nebraska, was transferred to the United States Bureau of Ethnology. His chief works are: 'On the Comparative Phonology of Four Siouian (Sioux) Languages' (1883); 'Siouian Folklore and Mythologic Notes' (1884); 'Kansas Mourning and War Customs' (1884); 'Indian Personal Names' (1886).

Dorsey, Sarah Anne, American prose-writer: b. Natchez, Miss., 16 Feb. 1829; d. New Orleans, La., 4 July 1879. She was a linguist and a student of Sanskrit. Included in her writings are: 'Lucia Dare' (1867); 'Panola, a Tale of Louisiana' (1877); 'Atalie'; and 'Agnes Graham.' She was amanuensis to Jefferson Davis in the preparation of his 'Rise and Fall of the Confederate Government.'

Dorsey, Stephen Wallace, American politician: b. Benson, Vt., 28 Feb. 1842. He served in the Federal army during the Civil War, and subsequently removing to Arkansas was active in politics. He was a member of the Republican State and county committees; was elected to the United States Senate in 1873; and was secretary of the Republican National Committee for the campaign of 1880. At the time of the "star route" exposures he was accused of having influenced legislation in the Senate, was indicted before the grand jury in Washington; but was acquitted on his second trial. After 1880 he withdrew from politics.

Dorste'nia (named after Dr. Dorsten, a German botanist), a genus of plants of the natural order *artocapaceæ*, natives of tropical America. The genus is remarkable for the receptacle in which the numerous small flowers are sunken, the female flowers being the most depressed. The rootstocks of various species are used in the preparation of a medicine, once in much repute against low fevers, and as a mild stimulant and diaphoretic, also as efficacious against snake bites, whence the Spanish name, *contrayerva*.

Dort, dôrt, or **Dordrecht**, dôr'drĕnt, Holland, city in the province of South Holland; 10 miles southeast of Rotterdam. An inundation in 1421, in which upward of 70 villages were destroyed and 100,000 people drowned, separated the site on which Dort stands from the mainland. It was founded in 1013. Here, in 1572, the states of Holland, after the revolt from Spain, held their first assembly; and sat from 13 Nov. 1618 to 19 May 1619, the conclave of Protestant divines known as the Synod of Dort, which condemned the doctrines of Arminius as heretical, and affirmed those of Calvin. Dort is the birthplace of the brothers De Witt of Cuyp, and Ary Scheffer; to the last a statue was erected in the market-place in 1862. Pop. (1900) 38,804.

Dort, Synod of, an assembly of Protestant divines convoked at Dort (Dordrecht) in 1618–19. Besides the Dutch and Walloon divines, it included representatives from England, Scotland, Switzerland, and part of Germany. It was chiefly occupied in considering the doctrines of Arminius (see ARMINIANISM). It originated the project of translating the Bible into Dutch, which was executed after 19 years' labor. The translation is known as the 'Dort Bible.'

Dortmund, dôrt'moont, Germany, city in the province of Westphalia, on the Ems, 47 miles north-northeast of Cologne. In 1899 it was connected by canal with the canalized Ems (giving a waterway to Emden on the North Sea), and extensive harbor accommodation has been provided. It owes its recent great and increasing prosperity to its becoming the centre of several important railway systems, to the opening of extensive coal mines in the vicinity, and to the active manufactures of iron, steel, machinery, railway plant, etc. It was once a free imperial and Hanseatic town, and the seat of the chief tribunal of the Vehme. Pop. (1900) 142,418.

Dorus, the eponymous ancestor of the Dorians (q.v.).

Dory, or John Dory (*Zeus faber*), a fish belonging to the family *Zeniidæ*, somewhat allied to the mackerel, and celebrated for the delicacy of its flesh. It has the spinous portions of the dorsal and anal fins separated by a deep emargination from the soft-rayed portion, and has also the base of all the vertical fins, and the carina of the belly anterior to the anal fin, furnished with spines or serratures; color, yellowish-green, with a blackish spot on each side; dorsal and anal fins with furcate spines, and a long filament produced from behind each dorsal spinous

ray. The dory has exceedingly protractile jaws, which enable it to capture small fish, etc., when concealed in the ooze or weeds, after slowly moving upon them in a stealthy, catlike manner. It is found on the coast of England, and on the Atlantic shores of Europe, and in the Mediterranean. A related species (*Zenopsis ocellatus*) has been once taken on our coasts at Provincetown, Mass.

Also a North Atlantic species of rock-fish (q.v.).

Dos Passos, John R., American lawyer: b. Philadelphia 1854. He is of Portuguese descent. He studied law; served in the Federal army during the Civil War, and after practising law in Philadelphia for some time went to New York in 1867, where he was very successful in the criminal branch of practice. Later he became an authority upon banking, corporate and financial law. He has written considerably. Among his published works are: 'A Treatise on the Law of Stock Brokers and Stock Exchanges' (1882); 'The Interstate Commerce Act' (1887); 'Commercial Trusts'; 'The Anglo-Saxon Century' (1903).

Dôseh, dō'sĕ, an Arabic word meaning "treating," denotes a remarkable ceremony, which, until its suppression in 1884, used to take place in Cairo annually on the feast of the prophet's birth (Moolid), in the third month of the Mohammedan year. A party of dervishes of the Sa'di order, to the number of a hundred or more, lay down on their faces, side by side, with their arms doubled under their foreheads. A dozen more ran along upon their comrades' prostrate backs, beating drums, and shouting "Allah." Then the sheikh, mounted, rode along upon the line of bodies, from whom audible prayers could be heard proceeding. It was in consequence of evidences of considerable injury inflicted by the iron-shod hoofs that the khedive Tewfik suppressed this singular religious rite. See E. W. Lane, 'Modern Egyptians,' xxiv.; Butler, 'Court Life in Egypt.'

Dosith'eans (from their founder, Dositheus), a sect founded by Dositheus, whose life and labors were in Samaria. The popular belief is that he was the first Christian "heretic." Mosheim, on the contrary, thought that he was not a Christian at all, but a false Messiah, who lived at or about the time of our Lord. He is said to have been very rigid in his Sabbatarianism. His other opinions were partly Samaritan, partly Sadducean.

Dosith'eus, Jewish heresiarch of the 1st century A.D. He insisted on a painfully rigorous observance of the Sabbath, and died of excessive fasting. There was also a grammarian of this name in the 4th century, who wrote a Latin grammar for Greek boys.

Dosso Dossi, dŏs'sō dŏs'sē (properly Giovanni di Nicolo Lutero), Italian painter: b. near Mantua 1479; d. Ferrara 1542. His manner approaches to that of Titian, with whom he painted some apartments in the ducal castle. His paintings there represent bacchanalians, fauns, satyrs, and nymphs. In other paintings he imitated Raphael. Among eight of Dossi's pictures in Dresden, the 'Dispute of the Four Doctors of the Church' is distinguished as a masterpiece by accurate delineation and peculiar power of coloring, and is entirely in the style of Titian. His brother, Giovanni Battista (d. 1546) was a less celebrated painter.

Dost, Mohammed Khan, Afghan usurper: b. about 1790; d. 1863. He obtained possession of the throne of Afghanistan after the flight of Mahmud Shah in 1818; ruled with great ability, and although driven from his throne by a British army, was ultimately restored, and later became a steady supporter of British power in the East.

Dostoyevsky, Feodor Mikhailovitch, fā'ō-dōr mī-kāl'ō-vĭch dŏs-tō-yĕf'skĭ, Russian novelist: b. Moscow 11 Nov. 1821; d. St. Petersburg 9 Feb. 1881. After serving as an officer of engineers he devoted himself to literature, but becoming connected with communistic schemes was banished to the mines of Siberia, from which he returned in 1856 to resume his literary activity. His first novel, 'Poor People,' came out in 1846, and an English translation of it appeared in 1894. Among other of his works that have appeared in English are 'Crime and Punishment' (1868), a very powerful work, characterized by masterly psychological analysis and thrilling realism in description; 'Injury and Insult'; 'The Friend of the Family'; 'The Gambler'; 'The Idiot'; 'Prison Life in Siberia.' A complete edition of his works was published (1882–3).

Dotheboys Hall, the school which figures in Dickens' novel, 'Nicholas Nickleby.' It was kept by Squeers (q.v.). The name is a rendering of Do-the-Boys Hall. The effect of the exposure by Dickens of the conditions prevailing in some of the English boys' schools was a complete reformation in their methods and management.

Doto, one of the Nereids.

Dot'terel (*Charadrius-* or *Eudromias-morinellus*), a species of plover (q.v.) which breeds in the north of Europe and returns to the south for the winter. It is found all over Europe and northern Asia. The dotterel has always been highly esteemed for the table, but its extermination in Great Britain is more likely to result from the assiduity of the egg collector than of the sportsman, a consummation likely to be hastened from its habit of laying but three eggs, instead of four like most plovers. It likewise differs from all other species of plover in having the sternum fenestrated instead of notched posteriorly, and in the larger size and brighter colors of the female.

Dou, Gerard. See Dow, Gerard.

Douai. See Douay.

Douarnenez, doo-ār-nĕ-nĕs or -nĕz, France, a port in the department of Finistère, on the Bay of Douarnenez, eight miles northwest of Quimper by rail. It is important for the sardine fishery. Pop. 12,900.

Douay, doo-ā, or **Douai**, France, city in the department of Nord, on the Scarpe River, 18 miles south of Lille. It is one of the oldest towns in France. Its manufactures and trade are quite important. It is noted for the schools which were established here in the 16th and 17th centuries. English, Scottish, and Irish colleges, and novitiates of English Franciscans and Benedictines were all affiliated with the Douay University. Printing-presses and libraries furnished an opportunity for publishing

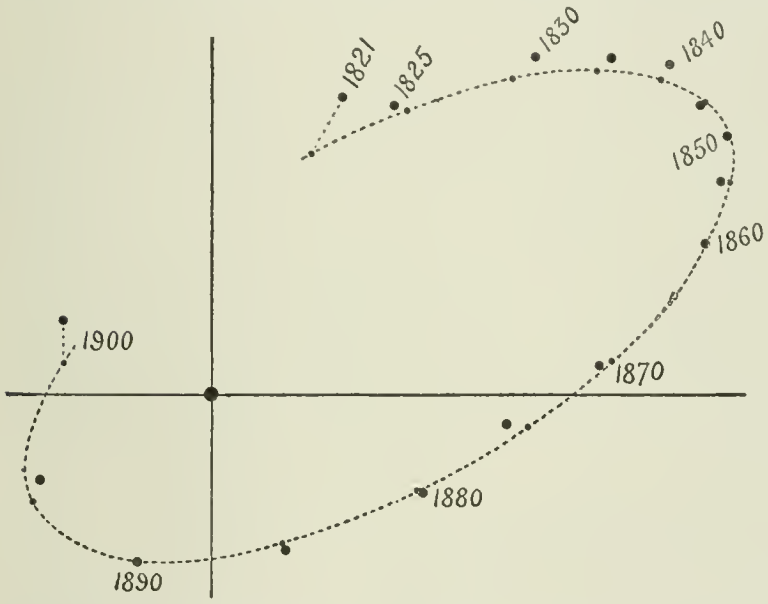
books for English Catholics. The university property was confiscated in 1793, in the revolutionary period; students and teachers fled to England, and to this migration the Roman Catholic college at Ushaw, near Durham, owes its origin. The English Benedictines still have an establishment at Douay. The library now in the town contains about 60,000 volumes and many valuable manuscripts. Pop. 32,146. See DOUAY BIBLE.

Douay Bible, the name commonly given to the version of the Vulgate text of the Scriptures made at Rheims in France for the use of English-speaking Catholics. The translators and editors of this version were Dr. William (afterward Cardinal) Allen, Dr. Gregory Martin, Dr. Richard Bristow, and John Reynolds, all of them alumni of Oxford University. The work of translating was done mostly by Dr. Gregory Martin, "a scholar of distinguished attainments both in Greek and Hebrew," says the eminent biblical critic, Dr. Westcott. The New Testament was published at Rheims in 1582 and the Old at Douay in 1609–10, both in quarto. The text has since that time undergone numerous revisions, chiefly for correction of its literary form which was faulty because of the employment of words of Latin origin and unintelligible for readers unacquainted with Latin, instead of the homely English equivalents, for example, "comessations" (revellings), ebriety, impudicity, agnition, coinquination, contristate, donary, exinanite, suasible: all mere Latin words with English terminations. This very serious fault was in revision after revision corrected with greatest thoroughness by Dr. Challoner (q.v.), whose first edition of the revised New Testament was published in 1749 and that of the Old Testament in the following year. Challoner's final revision has itself undergone revision several times since, but only for correction of minor errors and oversights. Despite its very serious defects the original Rhemish translation has elicited from a most competent judge, Dr. Westcott, 'History of the English Bible,' the praise of great fidelity to the text of the Vulgate. "The Rhemists," he says, "in their scrupulous and even servile adherence to the text of the Vulgate . . . frequently reproduced with force the original order of the Greek, which is preserved in the Latin; and even while many unpleasant roughnesses occur there can be little doubt that this version gained on the whole by the faithfulness with which they endeavored to keep the original form of the sacred writings. . . . The same spirit of anxious fidelity to the letter of their text often led the Rhemists to keep the phrase of the original when others had abandoned it. . . . When the Latin was capable of guiding them the Rhemists seem to have followed out their principles honestly; but whenever it was inadequate or ambiguous, they had the niceties of Greek at their command."

Double Bass or Base, sometimes called contrabass, is the largest and deepest voiced of the viol family. Though seldom used in solo work it is counted one of the foundations of the modern orchestra. Originally it had only three strings, but used to-day with four, from the pitch of the third E below the violin clef. The strings are tuned a fourth apart. It probably derives its name from the fact that it sometimes doubles the bass given to the 'cello or similar instrument in a score. It first appeared in the 16th century and has been attributed to the inventive genius of Gasparo da Salo.

Double Bassoon, also known as contrafagotto, stands in the same relation to the oboe family as the double-bass (q.v.) does to the stringed instruments, being the largest and deepest toned. It has a compass of more than three octaves upward from the third C (and even B♭) below middle C; an octave lower than the ordinary bassoon. It has a conical tube over 16 feet in length, but bent up so compactly that it causes no inconvenience to the player. Many great masters of orchestration have written liberally for it, especially Haydn, Beethoven, Spohr, and Mendelssohn.

Double Consciousness, a peculiar mental condition, illustrated by the celebrated story of Dr. Jekyl and Mr. Hyde, which describes a rare type of phenomenon occasionally met with in certain nervous affections. By double consciousness is meant, that at certain times, in the waking consciousness of the individual, certain dominant ideas control and impart to the individual a definite personality, known and recognized as such by his friends and associates, and that, at other times, also in a distinctly conscious state, an entirely different series of ideas may govern the person, making him think, feel, and act in a manner entirely different from that of his former personality. It would seem, from many recent studies concerning this phenomenon, that it is practically always a symptom of a diseased mental state and that one of the personalities, so-called, is distinctly pathological and does not pertain to the ordinary conscious states, but is a symptom of a hysterical or epileptic attack. Hypnotic double consciousness is difficult to write about, inasmuch as a large proportion of the observations made by seemingly reputable observers are plainly fictional; but there remains, over and above such untrustworthy accounts, a certain residue of observations which would tend to show that a true double consciousness might exist in the hypnotic phenomenon. Of course it is understood that in normal life, different phases of feeling come and go, and that all normal people do not feel the same at all times, but there is rarely in normal life the marked distinction between two phases of mental activity, such as is described as characterizing the phenomenon of double consciousness. In certain forms of psychical epilepsy, there is a phenomenon of great interest, the so-called automatic epileptic condition, during which the patient may be absolutely different from his former self. This state in epilepsy may persist for a few moments, a few hours, a few days or even extend for weeks. While in this condition the patient may act in a manner totally foreign to his previous self. It is probably true that the nucleus of the condition known as double consciousness must be found in the study of these automatic states that occur in epilepsy. Trance conditions, cataleptic phenomena, somnambulistic performances, etc., are certainly allied states, a complete judgment on which, however, must be reserved for future study. See Gower, 'Epilepsy'; Löwenfeld, 'Der Hypnotismus'; 'Annales des Sciences Psychiques.'



Double Dragon, Order of the, a military order of China, established to honor foreigners who had served China in a military capacity. In 1882 it was made to include other foreigners who had rendered service to the nation.

Double Eagle, a United States coin of the value of $20, the eagle being $10. The name is a book-word, the popular term being "twenty-dollar gold piece." The piece was authorized by Congress in March 1849, and the first ones were struck in 1850. The name refers to the figure of the eagle upon it. It was one of the coins authorized by the Act of 1873.

Double Flowers are flowers which, usually through cultivation, have their stamens and pistils developed into petals, by which the beauty of the flower may be enhanced, though its reproductive powers are sacrificed. All intermediate stages between stamens and petals can be seen in double-flowered roses and carnations. It is frequently observed that a multiplication of the leaf accompanies the conversion of stamens into petals; so that a single stamen may be represented by two or more petal-like leaves. Double flowers remain fresh two, three, even eight days longer than similar normal single flowers.

Double Standard, in economics the phrase double standard is used to signify a double standard of monetary value fixed by legislative enactment. It implies the existence of what is known as the gold standard on the one hand, and the silver standard on the other. Wherever the double standard in its integrity is in use a creditor is bound to accept payment of any sum in coins of either of the metals, gold or silver, which the debtor may choose to tender. See BIMETALLISM.

Double Stars are stars which, while they may appear single to the eye, are known, by telescopic observation, to consist of two constituents that are near enough together to justify the assumption of a physical connection. About 10,000 such stars are known. The first systematic study of these objects was made by Sir William Herschel, who, between the years 1779 and 1784, made extensive catalogues of them, because he thought it likely that they were only optically double, one component being really much more remote than the other, and the apparent duplicity being due to the fact that the two lie almost in the same straight line with us. If that were the case, the earth's orbital motion about the sun might be great enough to make an appreciable variation in the distance or direction of one star from the other, if the system were viewed at different times in the year. After recording the distances between many of these stars, as well as the direction of the line joining the two components, he went over them again to see if any changes could be noted; and in so doing (as his son, Sir John Herschel has recorded) "his attention was altogether diverted from the original object of the inquiry by phenomena of a very unexpected character, which at once engrossed his whole attention." Instead of finding an annual and alternate increase and decrease of the distance, and a corresponding periodic variation in their direction, he saw that in many cases there was a continuous change in both, advancing steadily in one direction. If this were due to the fact that the solar system and the two components of the double star were moving independently through space, we should expect the motion of either of the components, relatively to the other one, to be sensibly rectilinear. After the lapse of 25 years Herschel became satisfied that this is not always the case, for in some instances he found good evidence of actual orbital motion, and in 1802 he announced that "there exist sidereal systems, composed of two stars revolving about each other in regular orbits," in the same manner that the earth revolves about the sun, or the moon about the earth. About the year 1819 William Struve took up the systematic study of these stellar systems, and made a long series of most excellent measures of them covering a period of many years. Subsequently the work was taken up by other skilled observers, and we now have a vast mass of data of this sort, from which fairly good orbits of some of the systems have been obtained. The most comprehensive book on the subject is Crossley, Gledhill and Wilson's 'Handbook of Double Stars,' which is a treasury of numerical data and references, and also contains methods for computing the orbits of double stars, as well as advice concerning the making of observations. The star known to astronomers as "70 Ophiuchi" may be cited as

an example of a binary whose orbit has been determined with some degree of approximation. In reality, both of the components of a double star are in motion, each revolving about the common centre of gravity of the two; but it is known that in a system composed of two bodies revolving about each other no error is committed, so far as the relative motion of the two is concerned, by regarding one of them as fixed, and assuming that the other revolves about it. It is customary, therefore, to regard the brighter component of such a star as fixed. In the case of 70 Ophiuchi one star is of about the fourth magnitude, while the other is of about the sixth. In the diagram the large black spot at the intersection of the two straight lines represents the larger star, the straight lines themselves representing, respectively, a meridian and a declination-circle passing through it. The dotted ellipse represents the apparent orbit of the component star, as computed by Risteen from all the available data up to the year 1895. The large dots that appear irregularly along the ellipse, being sometimes within it and sometimes without, represent the observed positions of the companion star, for every five years; and the corresponding smaller dots that lie exactly upon the ellipse represent the corresponding positions of the component, as calculated from Risteen's orbit. (The orbit itself is based upon observations taken each year; but the observations intermediate to those shown have been omitted from the diagram in the interest of clearness.) According to the computation here cited, the period of revolution of 70 Ophiuchi is 88.42 years. In addition to the stars that are visibly double when viewed through the telescope, numerous stars are now known which have been proved to be double by means of spectroscopic observations. (See DOPPLER'S PRINCIPLE.) The periods of revolution of some of these are exceedingly short. Thus, one of the components of the telescopically double star Kappa Pegasi is itself a spectroscopic binary with a period of only six days.

Doubleday, Abner, American military officer: b. Ballston Spa, N. Y., 26 June 1819; d. Mendham, N. J., 26 Jan. 1893. He was graduated at the United States Military Academy in 1842, rising to the rank of colonel in 1870 (brevet lieutenant-colonel in 1865). He was second in command at Fort Sumter in 1861, firing the first gun in its defense, and he greatly distinguished himself at Gettysburg. He published: 'Reminiscences of Forts Sumter and Moultrie in 1860–1' (1876); 'Chancellorsville and Gettysburg' (1882).

Doubleday, Neltje Blanchan, American author: b. Chicago 23 Oct. 1865. She was married to F. N. Doubleday in 1886. She has published: 'The Piegan Indians' (1894); 'Bird Neighbors' (1897); 'Birds that Hunt and are Hunted' (1898); 'Nature's Garden: Our Wild Flowers and Their Insect Visitors' (1900).

Doubleday, Russel, American author: b. Brooklyn 26 May 1872. He was educated in private schools, and served in the United States navy during the Spanish-American war 1898. He has written: 'A Gunner Aboard the Yankee'; 'Cattle Ranch to College.'

Doublet, a close-fitting garment, covering the body from the neck to a little below the waist. It received its name from being originally lined or wadded for protection. At first it had short shirts, but these diminished as the body of the garment became fuller and more elaborate under the reign of Queen Elizabeth. During the period of Charles I. and after Charles II. it lost all pretense and dwindled into a sleeveless jacket, the forerunner of our modern waistcoat. Originally was introduced from France into England in the 14th century.

In lapidary work, a counterfeit stone composed of two pieces of crystal, with a color between them, so that they have the same appearance as if the whole substance of the crystal were colored. Again accomplished another way by taking a thin layer of a precious gem and fastening it on the line of the girdle to a piece of glass colored to match. Some invisible cement is employed for the purpose, such as gum mastic.

Doubling the Cube, a celebrated problem among the ancient Greek geometers. According to legend the problem originated in an oracle of Apollo delivered to the people of Delos, and hence it has been called the Delian problem. The altar of Apollo at Delos was a cube, and once when they had offended him he ordered that the size of it should be doubled. This was easily done, but had no effect in mitigating the pestilence, which was the usual consequence of Apollo's wrath. On applying to him again the reply was that they must not change the shape of the altar. Hence arose the problem to find the exact size of the side of a cube the contents of which should be twice that of another given cube. The problem, however, was not invented by Apollo, he had only cunningly taken advantage of a problem which had already occupied Hippocrates of Chios and other Greek geometers. This problem the Greek geometers failed to solve, although their efforts to do so proved useful in advancing the study of geometry. It is indeed incapable of arithmetical solution, as will be made clear by merely examining the cubes of the first few numbers consecutively.

The cubes of the numbers from 1 to 9 are:

1	2	3	4	5	6	7	8	9
1	8	27	64	125	216	343	512	729

Here it is evident that taking any given arithmetical unit, it is impossible to find a number depending on it of which the cube will be double that of the cube of any other number depending on the same unit. If, for example, the side of Apollo's altar measured 3 feet, the cubic content of the doubled altar would have to be 54 feet; but it is clear that no whole number will give 54 as its cubic, and as no fraction multiplied by itself will give a whole number, the exact dimensions of the side of this doubled altar cannot be given either in whole feet or in any finite fraction of a foot. This does not prove, however, that a cube of this size cannot exist, but only that between its side and that of a cube whose side is three feet no definite arithmetical ratio can be fixed.

Doubloon, dŭb-loon', a gold coin of Spain, equal in value to two pistoles. It was worth 1730 to 1772 about $8.24, from 1772 to 1786, $8.08, and from 1786 to 1848, $7.87. Although the coinage of the doubloon has ceased in Spain, coins still current are valued at $5.02.

Doubs, doo, France, (1) a department which is traversed by four chains of the Jura. Pop.

305,193. (2) Doubs, a river 250 miles in length, rises in this department.

Doubting Castle, the castle in 'Pilgrim's Progress,' where Christian and his companion Hopeful are imprisoned for a time by Giant Despair.

Doubting Insanity. See INSANITY.

Douc, dook, a species of small monkey (*Semnopithecus nemæus*), native to Cochin-China. It is curiously marked with red, white, and black.

Doucet, Charles Camille, shärl kä mēl doo-sā, French dramatist: b. Paris 16 May 1812; d. there 1 April 1895. He became in 1853 a government official in the theatrical department; was elected to the Academy in 1876, and soon after made its standing secretary. The best known of his many very successful comedies are: 'A Young Man' (1841); 'Lawyer in His Own Cause' (1842); 'Forbidden Fruit' (1857); 'Consideration.' His lyric pieces for the stage, 'Velasquez' (1847), and 'Antonio's Barque' (1849), were crowned by the Academy.

Doucet, Henri Lucien, ŏn-rē lü-sē-ŏn, French painter: b. Paris 23 Aug. 1856. He was a pupil of Lefebvre and Boulanger; and won the Prix de Rome in 1880. Among his paintings are: 'Adam and Eve'; 'Atala'; 'Après le Bal'; 'Hagar'; and a number of portraits, including one of Mme. Galli Marie of the Opéra Comique.

Doudney, Sarah, English novelist: b. Portsmouth 15 Jan. 1843. She began writing when quite young and has published: 'A Woman's Glory' (1885); 'The Missing Rubies' (1886); 'When We Two Parted' (1887); 'Strangers Yet'; 'Stepping Stones'; 'The Strength of Her Youth'; 'Thy Heart's Desire'; 'Where Two Ways Meet'; 'Under False Colors'; 'Nothing but Leaves'; 'Miss Willowburn's Offer'; 'Where the Dew Falls in London' (1890); 'Through Pain to Peace' (1892); 'A Romance of Lincoln's Inn' (1894); 'Katherine's Keys' (1895); 'Pilgrims of the Night' (1896); 'A Cluster of Roses'; 'Lady Dye's Reparation' (1899); 'Silent Strings' (1900); 'Godiva Durleigh'; 'Child of the Precinct.'

Dougall, Lily, Canadian novelist: b. Montreal, Canada, 16 April 1858. She has published: 'Beggars All' (1891); 'What Necessity Knows' (1893); 'The Mermaid' (1895); 'The Madonna of a Day' (1896); 'A Dozen Ways of Love' (1897); 'The Mormon Prophet' (1898).

Dough'bird, a name given to several species of curlew (q.v.), but more especially to the Eskimo curlew (*Numenius borealis*).

Doughface, a nickname applied to northern politicians who were inclined to yield to the southern States in the antebellum agitation over States' rights and slavery. The term is traced back to 1820, when it was applied to the Northerners who supported the Missouri Compromise (q.v.).

Doughty, Thomas, American landscape painter: b. Philadelphia 19 July 1793; d. New York 24 July 1856. He was apprenticed in his youth to a leather manufacturer, and afterward carried on the business on his own account. A growing taste for art, however, induced him to become a painter. He practised his profession for many years in the United States, and also in London and Paris.

Douglas, Scottish noble family. Their origin is unknown. They were already territorial magnates at the time when Bruce and Baliol were competitors for the crown, and like most of the Scottish nobility did homage and took oaths of allegiance to Edward I. They had estates both in England and Scotland, but chiefly in Scotland. One of them, William Douglas, joined Wallace. As their estates lay on the borders they early became guardians of the kingdom against the encroachments of the English, particularly of the Percies, who occupied a similar position on the English border, and acquired in this way power, habits, and experience which frequently made them formidable to the crown. The most important members of this family in chronological succession are:

JAMES, son of the William Douglas who had been a companion of Wallace, and is commonly known as the Good Sir James, early joined Bruce, and was one of his chief supporters throughout his career, and one of the most distinguished leaders at the battle of Bannockburn. He fell in battle with the Moors while on his way to the Holy Land with the heart of his master, in 1331.

ARCHIBALD, youngest brother of Sir James, succeeded to the regency of Scotland in the infancy of David. He was defeated and killed at Halidon Hill by Edward III. in 1333.

WILLIAM, son of the preceding, was created first earl in 1357. He recovered Douglasdale from the English, and was frequently engaged in wars with them. He fought at the battle of Poitiers. He died in 1384.

JAMES, the second earl, who, like his ancestors, was constantly engaged in border warfare, was killed at the battle of Otterburn in 1388. After his death the earldom passed to an illegitimate son of the Good Sir James, Archibald the Grim, Lord of Galloway.

ARCHIBALD, son of Archibald the Grim and fourth earl, was the Douglas who was defeated and taken prisoner by Percy (Hotspur) at Homildon, 14 Sept. 1402. He was also taken prisoner at Shrewsbury, 23 July 1403, and did not recover his liberty till 1407. He was killed at the battle of Verneuil, in Normandy, in 1427. Charles VII. created him Duke of Touraine, which title descended to his successors.

WILLIAM, sixth earl, b. 1422, together with his only brother, David, was assassinated by Crichton and Livingstone at a banquet to which he had been invited in the name of the king, in Edinburgh Castle, 24 Nov. 1440. Jealousy of the great power which the Douglases had acquired from their possessions in Scotland and France was the cause of this deed.

WILLIAM, the eighth earl, a descendant of the third earl, restored the power of the Douglases by a marriage with his cousin, heiress of another branch of the family; was appointed lord-lieutenant of the kingdom, and defeated the English at Sark. Latterly having entered into a treasonous league, he was invited by James II. to Stirling and there murdered by the king's own hand, 22 Feb. 1452.

JAMES, the ninth and last earl, brother of the preceding, took up arms with his allies to avenge his death, but was finally driven to England,

where he continued an exile for nearly 30 years. Having entered Scotland on a raid in 1484 he was taken prisoner and confined in the abbey of Lindores, where he died in 1488. His estates, which had been forfeited in 1455, were bestowed on the fourth Earl of Angus, the "Red Douglas," the representative of a younger branch of the Douglas family, which continued to flourish long after. The fifth Earl of Angus, Archibald Douglas, was the celebrated "Bell-the-Cat," one of whose sons was Gawin Douglas, the poet. He died in a monastery in 1514. Archibald, the sixth earl, married Queen Margaret, widow of James IV., attained the dignity of regent of the kingdom, and after various vicissitudes of fortune, having at one time been attainted and forced to flee from the kingdom, died about 1500. He left no son, and the title of Earl of Angus passed to his nephew, David. James Douglas, brother of David, married the heiress of the Earl of Morton, which title he received on the death of his father-in-law. His nephew, Archibald, eighth Earl of Angus and Earl of Morton, died childless, and the earldom of Angus then passed to Sir William Douglas of Glenbervie, his cousin, whose son William was raised to the rank of Marquis of Douglas. Archibald, the great-grandson of William, was raised in 1703 to the dignity of Duke of Douglas, but died unmarried in 1761, when the ducal title became extinct, and the marquisate passed to the Duke of Hamilton, the descendant of a younger son of the first marquis. The line of Angus or the Red Douglas is now represented by the houses of Hamilton and Home, who both claim the title of Earl of Angus.

Douglas, Alice May, American writer for young people: b. Bath, Maine, 28 June 1865. Her writings include in verse: 'Phlox'; 'May Flowers'; 'Gems Without Polish'; in prose: 'Jewel Gatherers'; 'The Peacemaker'; and 'Self-Exiled from Russia,' etc.

Douglas, Amanda Minnie, American author: b. in New York 14 July 1837. She has written about 30 novels besides doing other literary work. Among her novels are: 'In Trust'; 'Claudia'; 'Stephen Dane'; 'From Hand to Mouth'; 'Out of the Wreck'; 'A Woman's Inheritance'; 'Osborne of Arrochar' (1883); 'Her Place in the World' (1894). She has also written several juvenile tales.

Douglas, David, Scottish botanist: b. Scone, Perthshire, 1798; d. Hawaii 12 July 1834. In the botanical garden at Glasgow, he attracted the notice of Sir William Hooker, the professor of botany, who recommended him as a botanical collector to the Horticultural Society of London. He was accordingly, in 1823, sent by the society to the United States, where he procured many fine plants, and in particular increased the society's collection of fruit-trees. In 1824 he was sent on a second mission to explore the vegetation of the country adjoining the Columbia River, and southward toward California. In making the voyage he never lost sight of his object, and was able, during the short time the vessel touched at Rio Janeiro, to collect many rare orchidaceous plants and bulbs. He arrived at Fort Vancouver in 1825, 'and sent home, from time to time, many beautiful plants, with seeds and dried specimens. A species of pine of gigantic size, one of several which he discovered, bears his name, *Pinus Douglasii*.

Douglas, Gawin, Scottish poet: b. Brechin about 1474; d. London 1522. He was the son of Archibald, earl of Angus ("Bell-the-Cat"). Having taken orders in the church, he received the living of Prestonkirk, near Dunbar, and was also made provost of St. Giles, Edinburgh. In 1510 he was installed Bishop of Dunkeld, but had an uneasy tenure of office; and having gone to England, was deprived of his bishopric. Gawin Douglas' great work is a translation of the Æneid of Virgil (with the supplementary book of Maphæus) in heroic verse. It is executed with great spirit, and considering the age, with extraordinary elegance of diction. It was written about 1512, and is said to have been completed in 18 months. To each book is prefixed a highly poetical prologue. It was first published in 1553. Douglas also wrote 'The Palace of Honor' and 'King Hart,' both allegorical poems. A complete edition of his poems was published 1874.

Douglas, Henry Kyd, American author and jurist: b. Shepherdstown, W. Va., 29 Sept. 1840; d. Hagerstown, Md., 18 Dec. 1903. He was graduated at Franklin and Marshall College (1859), at the time when James Buchanan, afterward President of the United States, was a member of the faculty. He enlisted at Harper's Ferry in the Confederate Army as a private in Company B of the noted "Stonewall" Jackson Brigade. He took part in the battle of Bull Run, and for his bravery was promoted until he rose to be a captain. In March 1862 he made a ride of 103 miles in order that Gen. Ewell might at once join Jackson. This ride became celebrated in history. Horses were changed five times, and the ride was made through rain and mud. On his return he was promoted to inspector-general by Stonewall Jackson, with whom he served in every battle. At Gettysburg he was seriously wounded and was in prison nine months. His brigade was the last to surrender. Douglas was wounded nine times.

Douglas, John, English prelate: b. Pittenweem, Fifeshire, Scotland, 14 July 1721; d. Salisbury, England, 18 May 1807. He was educated at Oxford and in 1762 he was made Canon of Windsor, which benefice he exchanged for a residentiary canonry of St. Paul's. In 1751 he wrote 'Milton Vindicated from the Charge of Plagiarism.' In 1777 he prepared for the press the journal of Captain Cook's second voyage, to which he prefixed a well-written introduction, and added notes. In 1778 he was elected a Fellow of the Royal and Antiquarian Societies; and in 1781 he edited the account of Capt. Cook's third voyage. In 1787 he was raised to the see of Carlisle, and in 1792 was made Bishop of Salisbury.

Douglas, Robert Kennaway, English librarian and educator: b. Otry Sainte Mary, Devon, 23 Oct. 1838. In 1873 became professor of Chinese at King's College, London. Among his publications are: 'Life of Li Hung Chang' (1895); 'China' (1899).

Douglas, Stephen Arnold, American politician: b. Brandon, Vt., 23 April 1813; d. Chicago, 11 June 1861. His father, a physician, died three months after his birth, and his mother was left with scanty means of support. At the age of 15 he apprenticed himself to a cabinet-maker and worked for two years at the latter's trade. Then, after a short term of study at the

Brandon Academy, he accompanied his mother, who had married again, to a new home, near Canandaigua, N. Y., where he finished his schooling at an excellent academy, and where he began the study of law. He was interested deeply in political questions, even in these years, attaching himself with ardor to the new party of Democracy which Gen. Jackson was then molding into form. In 1833 he left Canandaigua to seek a career in the West, and, after several months of ill-health and hardship, found employment for the winter in school-teaching at Winchester, Ill. In the spring of 1834 he was admitted to the Illinois bar and settled himself at Jacksonville, in that State. From that time his rapid rise to prominence was extraordinary, even among careers of ambition in the young West. Physically delicate and short in stature, his small body was so strikingly in contrast with the power massed in a big brain and exercised by an indomitable will that admiring Jacksonville promptly gave him the name of the "Little Giant," which clung to him through life. Almost at once he became the acknowledged leader of his party in the town. A winning personality, an elastic temper, a fearless and ardent spirit, unbounded self-confidence and surpassing energy of intellect and will, were qualities that carried him always to the place of command. Within a year from his settlement at Jacksonville he was prosecuting attorney for his district; within two years he was seated in the legislature of the State; and from his service of a session in that body he passed into the office of United States Register of Public Lands, at Springfield, to which he was appointed by President Van Buren in 1837. His residence was at Springfield for the next 10 years, and there he came to acquaintance with Abraham Lincoln, his great political antagonist of a later time, whose rise to eminence was much slower than his own. In 1838 the bold young Jacksonian very nearly won an election to Congress in the strongly Whig district to which Springfield belonged. In 1841 he was appointed to a judgeship in the supreme court of the State, but resigned his seat on the bench two years later, to present himself again as a candidate for Congress, and with success. At that time (1843) he had just passed his thirtieth year. Most newcomers in Congress, even the ablest, need time to make a position of influence for themselves; but Douglas was prominent among the Democratic representatives of the Northwest from the first. The vigorous activity of his mind and the remarkable quickness of its working, made him formidable in debate; while the unhesitating resoluteness with which he threw himself into whatever he undertook carried him always to the front of the fighting line. At the beginning of his second term in the House of Representatives he was made chairman of its Committee on Territories; and when, at the end of that term, he was elected to the Senate (1845), he received the chairmanship of the same committee in that body. This gave him the direction of subjects in legislation which events were making more important and more exciting than any others in the politics of the time. Texas had just been annexed; the country was on the eve of a war of conquest with Mexico, and Great Britain was negotiating a fair settlement of the Oregon dispute. Should an expansion of national territory mean expansion of slavery, and, if so, to what extent? were the questions now rising in angry debate. They were brought into Congress by the famous resolution called the "Wilmot proviso," which declared that no slaves should be held in any territory acquired as the result of the Mexican War. Extremists on the pro-slavery side set up the opposing doctrine that slave-holding was a constitutional right in any territory, since slaves were a species of property recognized by the Constitution of the United States. A second ground of opposition to the Wilmot proviso was discovered, apparently first by Gen. Cass, who contended that the inhabitants of each territory should admit or exclude slavery as they pleased, by their own votes. This doctrine of "popular sovereignty," or "squatter sovereignty," as it was branded scornfully by Calhoun, commended itself to Douglas' mind. His attitude toward slavery was that of indifference to the right or wrong of the system, which he regarded confessedly as a problem in politics, and no more. Practically, the "squatter sovereignty" doctrine triumphed in the compromise measures of 1850, which admitted California to the Union under the free-state constitution that her people had framed, and organized New Mexico and Utah as territories with no restriction concerning slavery. Excepting Henry Clay, no one did more than Douglas in the framing of those measures and carrying them through. He was now so conspicuous among the chiefs of the Democratic party that he could aspire to its nomination for President in 1852. From the North he received strong support; but the less known and more pliant Franklin Pierce was preferred at the South. Douglas, not yet forty years of age, could afford to wait. At some time within the next two years he conceived his project for a more complete and final settlement of the slavery question than the compromise of 1850 had brought about. This, in his view, could be accomplished by a frank and full adoption of the principle of "popular sovereignty," applied to the whole national domain. Accordingly, in 1854, he startled the country by reporting from his committee what was known in its final form as the Kansas-Nebraska Bill, repealing the Missouri Compromise of 1820 (which excluded slavery from the territory of the Louisiana Purchase, north of 36° 30′) and leaving "the inhabitants thereof perfectly free to form and regulate their domestic institutions in their own way." At the North the bill raised a storm which even the bold spirit of Douglas must have watched with alarm. His own party was torn by it; that of the Whigs had already gone to pieces, and two new parties, "Know Nothing" or American, and Republican, now emerged from what seemed to be a general wreck of all in politics that belonged to the past. But Douglas, with no sign of faltering, fought a wonderful battle for his bill and carried it through. Then came the test in practice of his policy, applied in a struggle between anti-slavery and pro-slavery forces to control the settlement and the constitution-making of Kansas. The test was not favorable to the prestige of Douglas. He had heated instead of cooling the agitation of the slavery question, and made it more dangerous than before. As a candidate for the presidency he was hardly so strong in 1856 as in 1852; but after Buchanan, then elected, had driven Douglas to revolt, by countenancing the

fraud of the Lecompton Constitution, making a farce of "popular sovereignty" in Kansas, the manly course of the Illinois Senator gave him more of popularity in the free States than he lost in the South. The hostility of the administration, combining with the opposition of the new Republican party, already powerful in the Northwest, could not defeat his re-election to the Senate in 1858. Over any antagonist but Lincoln he would probably have won a great triumph; as it was, he came wounded from his debates with that extraordinary man. He had been forced to declarations that offended his party in one section of the country more than they satisfied it in the other, and made him the occasion of a hopeless breach between the two. Nominated, for President, at last, in 1860, by one wing of a divided party, he fought his last political battle, with all of his old obstinate valor, and went down in defeat. He was at the end of the small gift of bodily strength that he received at his birth; he had worn it out. He survived the election of Lincoln only long enough to stretch a loyal and supporting hand to his successful rival, in the crisis of rebellion that ensued. His last words to his followers were: "There can be no neutrals in this war."

J. N. LARNED,
Author of the History for Ready Reference.

Douglas, Sir William Fettes, Scottish painter: b. Edinburgh 29 March 1822; d. 20 July 1891. As a painter he was mainly self-taught. On first devoting himself to art he practised chiefly as a landscape painter, but he soon turned to figure subjects, producing 'Hudibras and Ralph visiting the Astrologer' (1856); 'Lovel and the Antiquary' (1857); 'The Summons to the Secret Tribunal' (1860); and 'The Magic Mirror' (1872); works distinguished by excellent coloring, and by especially firm, careful, and refined handling. His later years were entirely devoted to landscape water-colors. He is represented in the National Gallery of Scotland by 'The Messenger of Evil Tidings'; 'The Spell'; and 'The Bibliophilist.'

Douglas, England, capital of the Isle of Man, and a popular summer resort. Pop. 20,305.

Douglas Fir. See FIR.

Douglass, Andrew Ellicott, American archæologist: b. West Point, N. Y., 18 Nov. 1819; d. New York 30 Sept. 1901. He was graduated at Kenyon College in 1838, and after a business career of many years with the Hazard Powder Company, of which he became the president in 1867, he retired in 1876, and spent 10 winters on the coast of Florida, excavating Indian mounds, and collecting specimens of archæological interest to the number of 22,000, which may be seen in the American Museum of Natural History, New York. He is a member of many scientific societies, including the Société d'Anthropologie of Paris.

Douglass, David Bates, American civil and military engineer: b. Pompton, N. J., 21 March 1700; d. Geneva, N. Y., 9 Oct. 1849. He was graduated from Yale in 1813 and served in the engineer corps of 1813–31. He was one of the engineers of the Croton Aqueduct (1833–35), president of Kenyon College (1840–44), and professor of mathematics in Hobart College the last year of his life.

Douglass, Frederick, American lecturer and journalist, the son of a negro slave: b. Tuckahoe, Md., Feb. 1817; d. Washington, D. C., 20 Feb. 1895. Although his father was a white man, he was, according to the law, reared as a slave. In 1832 he was purchased by a Baltimore shipbuilder, but made his escape in 1838. As he had taught himself to read and write, and showed talent as an orator, he was employed by the Anti-Slavery Society as one of their lecturers. In 1845 he published his 'Autobiography,' and afterward made a successful lecturing tour in England. In 1870 he started a journal entitled 'The New National Era'; in 1871 he was appointed secretary of the commission to Santo Domingo; in 1872, presidential elector; in 1877, marshal for the District of Columbia, then commissioner of deeds for that district, and in 1889, United States minister to Haiti.

Doukhobors, doo'hō-bōrz (Russian *dukhobortsy*, "spirit wrestlers," from their vanquishing the doctrine of the Holy Spirit), a sect which started in Kharkov, Russia, about 1740, and spread rapidly in the Dnieper provinces. The founder's name is not preserved: he was a Prussian sub-officer who settled in Russia when his term expired. He and his successors, Kolesnikoff, Kapustin, etc., taught the familiar doctrine of the "inner light," with logical but socially inconvenient extensions: that as God in the soul is the one guide to action, the Bible is not inspired (though they accept the Ten Commandments), and it is not only superfluous but sinful to read and write, printing being a snare of the Devil; that God manifests himself in the fullest power in the human soul, and as they had that power, they were embodiments of God, and to be worshipped and obeyed as such; that Christ was only a sinless man, and the sinless leaders were his equals and successors. Every one's action being dictated by God, it cannot be wrong, and civil rulers are needless and their rule a usurpation; all being equal before God, churches are needless and they do not enter them; marriages need neither ceremonies nor permission, being of inclination only. It is easy to see that these tenets brought them in conflict with the authorities, who tried to restrict them to theory instead of practice, and imprisoned numbers for contumacy; but in 1801 a commissioner's report to Alexander I. that they were well-behaved citizens induced him to order them left alone. It worked so ill, from insubordination and social evils, that in 1819 the same Czar again authorized the sharpest punishments. At length, on their petition for a grant of waste lands where they could live their chosen life undisturbing and undisturbed, they were settled on the fertile banks of the Molochnaya, on the north shore of the Sea of Azov. Thus left alone, the leaders and their satellites embarked on a carnival of lust, avarice, and despotism; no woman nor piece of property was safe from them, nor any man's life who protested (a minutely exact parallel to an American case in similar conditions), and bands of maranders went about stealing whatever their employers liked. The report of an imperial commission was so shocking that in 1833–7 they were deported to the then wilderness of Transcaucasia; a high bleak plateau unfit for agriculture, where they became almost wholly cattle-raisers and -eaters, and increased to some

15,000. The government gradually put down the civil despotism of the leaders, and enforced decency of life; but it was not done without much petty tyranny, and doubtless corruption and abuse, of which they complained. Then came Pobiedonostseff's policy of unifying the elements of the empire, and enforcing conformity to the Greek Church; and in 1887 a bitter faction fight between two pretenders to the Doukhobor leadership rent the community. One section decided to emigrate to be rid of it all; and finally obtaining permission and negotiating successfully with other governments, a few went to Cyprus, while in 1899 a band of 2,000, under a son of Count Tolstoi, settled on lands granted them in Manitoba. The next year 5,000 more were located there and in the Northwest Territories. They would not take lands in severalty, but only in communities; but they were prospering and learning English, filling the schools with their children, and appearing to slough off their unassimilable characteristics. Suddenly they adopted the tenet that all use of animals or their products for human service is sinful, and refused to eat milk, butter, or eggs, wear woolen or leather garments, or use draft animals. Then one settlement refused to pay school taxes, till the government seized and sold their cattle. In the summer of 1902 they all at once turned their stock loose on the prairies and began hauling their own loads to market, sometimes 50 miles off, and themselves drawing the plows; the government rounded up the stock, sold it, and placed the proceeds to the credit of the communities. While crippled in power to work for lack of animals, the rumor spread that Jesus was shortly to appear at Winnipeg, 300 miles east, to lead them to a new kingdom; they deserted the villages, and on the night of 27 Oct., 1,500 to 2,000 set off across country. After dreadful sufferings from cold and hunger, and joined by thousands more, men, women, and children, they came near Yorkton 10 days after, and lay out in the fields with the thermometer at 22°. The police singled out the women and children and the sick, and locked them into comfortable quarters; several hundred of the men went on alone, the women clamoring to accompany them and some going insane. When about 100 miles from Winnipeg, the mounted police forced them into freight cars and took them back to their villages. These antic seizures make it probable that the persecutions of the Russian government were not wholly without excuse or humane intent.

Doulton, Sir Henry, English potter: b. Lambeth 21 July 1820; d. 19 Nov. 1897. At 15 he entered his father's establishment there, where he devoted himself to the most technical branch of the industry, and worked for many years at the potter's wheel. In 1846 he commenced the manufacture of stoneware pipes for sewage and drainage, for which a special factory was erected near Lambeth Palace, and thus initiated the substitution of impervious pipes for the old flat-bottomed brick drains. Sir Henry Doulton, however, is chiefly noteworthy as having been mainly instrumental in bringing about the revival in art pottery which has since spread into every civilized country; and his firm's works in art stoneware, silicon, impasto, terra-cotta, faience, and Doulton wares, have since 1870 gained the highest awards of judges at every exhibition of note throughout the world. He was created a Chevalier of the Legion of Honor (1878); was awarded the Albert medal in 1885; and in 1887 was knighted on the occasion of the queen's jubilee. See Pottery.

Doune, Scotland, village of Perthshire, on the Teith, nine miles from Stirling. Doune Castle, now a ruin, is described in Scott's 'Waverley'. Pop. 1,200. At Deanston, a mile west, are large cotton-mills, long managed by James Smith, a noted inventor and philanthropist.

Douro, dō'roo, or **Duero,** doo-a'rō (ancient Durius), one of the largest rivers of the Spanish Peninsula, which, flowing west, traverses about one half of Spain and the whole of Portugal, and, after a course of 500 miles, flows into the Atlantic three miles below Oporto. It is not of much navigable importance, but small vessels ascend about 70 miles from its mouth. In the Middle Ages it was celebrated for the gold that was found in its bed.

Douroucouli, doo-roo-koo'lē, a small Brazilian monkey, of nocturnal habits, which sleeps by day, and preys fiercely by night upon insects and small birds. It is of the genus *Nyctipithecus*, of which various species are known, all South American. They are about nine inches long, with tails somewhat longer than their bodies; and have soft grayish fur; their voices are discordant and disagreeable. They are known also as "owl-monkeys," and "night-monkeys."

Dousa, Janus (Latinized from Jan Van der Does), Dutch statesman, philologist, historian, and poet: b. Noordwyk, Holland, 6 Dec. 1545; d. there October 1604. In 1572 he went as ambassador to England to obtain the support of Queen Elizabeth for the cause of the Dutch. As chief commander, during the siege of Leyden by the Spaniards, he conducted himself with prudence and courage in the midst of the horrors of famine, plague, and civil dissensions. He kept up an intercourse with the expected deliverers by means of trained pigeons; and to these faithful messengers he has expressed his gratitude in some of his poems. The stadtholder, William I., compensated the city for its sufferings by the establishment of the university, of which Dousa was the first curator. His best-known work is 'Bataviæ Hollandiæque Annales' (1599).

Douw, Gerard. See Dow, Gerard.

Douzette, dow'zĕt, **Louis,** German painter: b. Triebsees, Pomerania, 25 Sept. 1834. He received a gold medal at Berlin in 1886. He is a landscape painter almost exclusively, and is particularly noted for his moonlight effects. His 'Moonlight on the Fjord' is in the Dresden gallery.

Dovalle, Charles, shärl dō-väl, French poet: b. Montreuil-Bellay 23 June 1807; d. 30 Nov. 1829. He was a poor provincial who came to Paris unknown, studied law, and burst on the literary world with 'The Oratory in the Garden,' and other delightful poems of a like nature, besides an 'Ode on Liberty.' His promising career was closed at 22 in a duel, the challenger being enraged at a literary criticism.

Dove, Heinrich Wilhelm, hīn'rĭh vil'hĕlm dō'vĕ, German physicist and meteorologist: b. Liegnitz 6 Oct. 1803; d. Berlin 4 April 1379.

He was educated at Breslau and Berlin, and in 1845 he was appointed professor of natural philosophy at the university of the latter city, a post which he held till his death. Among his works are 'Meteorological Researches' (1837); 'Distribution of Heat on the Surface of the Globe' (1852); 'Law of Storms' (1857); 'Optical Studies' (1859), and many papers in various journals.

Dove, Patrick Edward, Scottish economist, b. Lasswade 1812; d. Cape Town, Cape Colony, 1870. He was graduated at Aberdeen and studied at Heidelberg, achieving fame with 'The Theory of Human Progression' (1850), from which Henry George was accused of stealing the "single tax" idea. Dove wrote also: 'Science of Politics.'

Dove, a river in England, a tributary of the Trent, has its rise in the hills of the Peak of Derbyshire. It was the favorite fishing stream of Izaak Walton, who lived near with his friend, Charles Cotton; and it is still beloved of anglers.

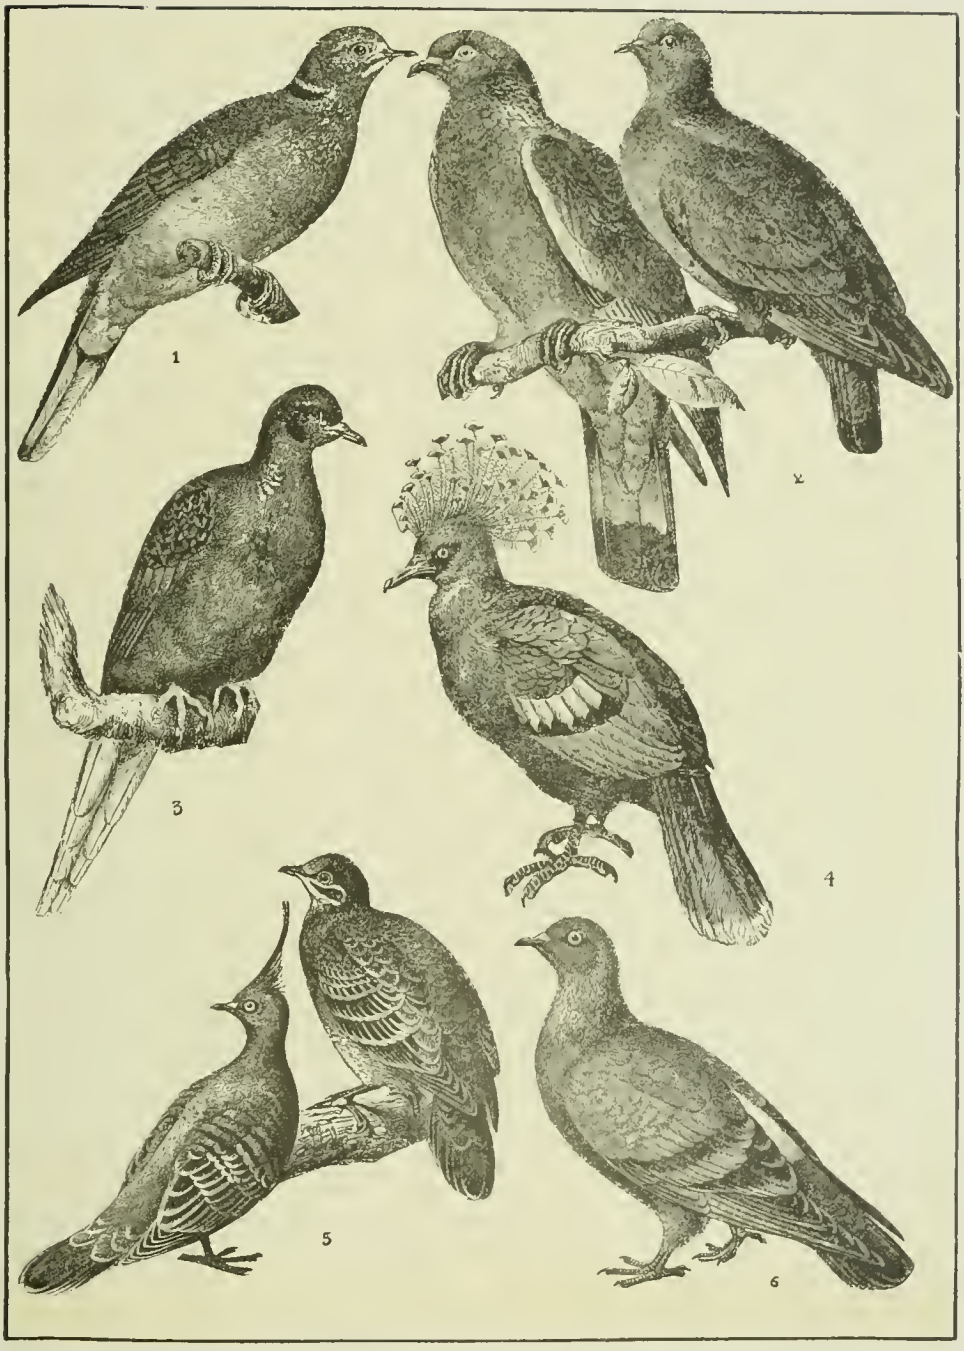
Dove, originally applied in England to several native and domesticated species of the genus *Columba;* the name dove is now used generally for the smaller species of the pigeon family (*Columbidæ,* q.v.), but in many cases interchangeably with pigeon. The name applies to about 10 native North American species, of which the most important are the mourning dove (*Zenaidura macroura*); the white-winged dove (*Melopelia leucoptera*); the ground dove (*Columbigallina passerina*), and several species of ground dove, of which only the first extends its range northward, the others being more especially derived from the West Indian and Mexican fauna, which includes many additional species. The mourning dove, so-called on account of its plaintive call, and unadorned plumage, ranges and breeds throughout temperate North America. The nest is a loose structure of twigs in which two eggs are deposited. In the late summer and autumn, when congregated in small flocks, doves are sometimes destructive to crops, and are much sought by gunners in localities where the game laws permit.

Several species of European and other exotic doves are well-known in this country in the domesticated state. The ring dove (*Columba palumbus*) occurs throughout Europe, collecting in large flocks during the winter and depredating fields of turnips and other crops. The rock dove, or rock pigeon (*C. livia*), is considered by Darwin ('Animals and Plants Under Domestication') to have been the original stock of our domesticated pigeons, which, as a result of careful selection, have diverged into many races, arranged by Darwin in four principal groups: (1) Pouters; (2) Carriers, Runts, and Barbs; (3) Fantails, Tumblers, Turbits, etc.; and (4) Trumpeters—which lead through some little modified varieties to the original stock still existing on the coasts of Europe and North Africa.

The turtle dove (*Turtur communis*), of Europe has been universally adopted in Christian countries as the emblem of gentleness and love, and figures much in poetry. The dove was the bird of Venus. Babylon was the city of the dove; it was a dove that whispered into the ear of Mohammed, and was his oracle. The dove was a sacred bird to the Israelites, and Jerusalem was the city of the dove. In Christian times it was the attribute of the Virgin Mary; was a symbol of the Holy Ghost, and carved on the tombs of martyrs as a figure of the resurrection.

Dove, The, one of two vessels which in 1633 sailed from Cowes, England, for Maryland with a company of colonists under Leonard Calvert. The other vessel was named The Ark. After a four months' voyage they landed on St. Clement's Island in the Potomac River.

Dove-plant, or **Holy Ghost Plant,** an orchid of Central America, much reverenced by the pious natives because of its resemblance to a dove with outstretched wings, the symbol of the Holy Ghost; called also Holy-Spirit flower.



Dove-tick, a bird parasite (*Argas reflexus*), the blind tick which infests doves and other birds. Some of the species are said to cause death by their sting. See Tick.

Dovekie, dŭv'kĭ, the little auk (*Alle alle*), one of the smallest of the family *Alcidæ,* a bird of high northern latitudes, living and breeding gregariously, on rocky sea-coasts of the North Atlantic and Arctic oceans. A single egg is laid by this bird on the bare rock. In winter, it is found along the coast of New England and the Middle States, and is occasionally blown by storms as far inland as Michigan. The dovekie, or sea dove, as it is also sometimes designated, is from eight to nine inches long; of a glossy blue-black above, with the under parts, and two patches on each wing, white. The adults have a small crest on the base of the beak.

The name is also sometimes applied by fishermen to one or more species of guillemot.

Do'ver, Del., city, capital of the State and county-seat of Kent County; on Jones creek, and the Philadelphia, W. & B. R.R., 75 miles south of Philadelphia. It is the seat of Wilmington Conference Academy and has a handsome monument erected to the memory of Cæsar Rodney, one of the signers of the Declaration of Independence. It is the centre of a great fruit-growing region. It is on high ground; is laid out with wide, straight streets that cross each other at right angles; and is built up chiefly with brick. Among its noteworthy buildings are a handsome State house, large courthouse, and new United States government building. Connected with the State house is a State library with upward of 50,000 volumes. There are several churches, a national and a State bank, fruit evaporating and packing establishments, steam flour-mill, foundry, machine shop, and sash, fruit crate, glass, and carriage factories. The city has valuable gas and water works, weekly newspapers, and good schools. Pop. 3,329.

Dover, England, a Cinque port and parliamentary and municipal borough in the east of Kent, England, 66 miles east-southeast of London. It is the headquarters of the Southeastern District of the British Army, and the nearest point of the English coast to France. The fortifications comprise Dover Castle, which occupies a commanding position on the chalk cliffs, 375 feet above the level of the sea, and still includes some of the old Saxon and Norman work; Fort Burgoyne on the north side of the town; Archcliffe Fort to the west, and the

1. Domestic Turtle-dove (Turtur risorious).
2. European Wood-pigeon (Columba palumbus) at the left; and Stock-dove (C. ænas) at the right.
3. American Wild or Passenger Pigeon (Ectopistes migratorius).
4. Papuan Crowned Pigeon (Goura albertisi)
5. Crested and Common Australian Bronze winged Doves.
6. Blue Rock-dove (Columbia livia).

batteries on the Western Heights, where large barracks are situated. Pop. 35,000.

Dover, N. H., city, county-seat of Strafford County; on Cocheco River, and the Boston & M. R.R.; 168 miles north-northeast of Boston. It is situated on hilly ground, is regularly laid out, and has many handsome buildings and residences. The Falls of Cocheco, within the city limits, are the source of abundant water power. Dover's industries include several large cotton- and woolen-mills; an extensive print works, with a capacity of over 30,000,000 yards annually; manufactories of boots and shoes, oil cloth, hats and caps, sandpaper and glue; and several tanneries, brass- and iron-foundries, and machine shops. There are several churches; about 40 public schools, high school, St. Joseph's Hill School, Franklin Academy; a national bank; several savings banks; daily and weekly newspapers; electric lights, and street railways. It is the oldest city in the State; was settled in 1623; nearly destroyed by the Indians in 1689; and was chartered as a city in 1855. Pop. (1900) 13,207.

Dover, N. J., city in Morris County, on the Rockaway River, the Lackawanna, and the New Jersey C. R.R.'s, and the Morris and Essex Canal; 28 miles west of Newark. It has extensive iron interests, railroad shops, machine shops, furnace and stove factories, and silk and hosiery mills. Five miles distant is a government powder magazine. Nearby are Lake Hopatcong, Mt. Arlington, Budd's Lake, and Schooley's Mountain, all noted summer resorts. The city has a high school, several churches, business college, daily and weekly newspapers, electric lights, and a national bank. Pop. 6,000.

Dover, Tenn., town, county-seat of Stewart County; on the Cumberland River, near Fort Donelson (q.v.). It is an insignificant village of less than 500 inhabitants, but is noteworthy as containing a national cemetery, where 672 soldiers of the Civil War are buried.

Dover, Strait of, the narrow channel which connects the North Sea with the English Channel, and separates England and France. At the narrowest part it is only 21 miles wide. The depth of the channel at a medium in the highest spring tides is about 180 feet. On both the French and English sides the chalky cliffs show a correspondency of strata which leaves no room for doubt that they were once united. Various projects for connecting Dover and Calais more closely have been advanced, as by bridge or tunnel or by trains on submerged rails. When making examinations for the tunnel scheme, coal was discovered in the bed of the Strait.

Dover's Powder was first prescribed by Thomas Dover, M.D. (1660–1742). The powder is prepared by mixing powdered ipecacuanha root, 1 part; powdered opium, 1 part; and sulphate of potash, 8 parts. The whole is thoroughly mixed, and the ordinary dose is from 5 to 10 grains. Occasionally, saltpetre is added. It is a most valuable medicine, and acts as a sudorific, increasing the proportion of sweat or sensible perspiration. As a "home remedy" for warding off a cold it is considered invaluable. Three or four grains will often relieve an attack of heartburn.

Dovetail, a term used in carpentry; the fastening of boards together by letting one piece into another, in the form of the tail of a dove. The dovetail is the strongest of jointings, because the tenon, or piece of wood which is put into the other, goes widening to the end, so that it cannot be drawn out again. Dovetails are either exposed or concealed; the latter being of two kinds, lapped and mitred. There is also a dovetail hinge, dovetail saw, dovetail file and in Roman architecture an ornamented molding in the form of a dove's tail.

Doveton, Frederick Bazett, English author: b. Exeter 1841. He has published 'Snatches of Song' (1880); 'Sketches in Prose and Verse' (1886); 'Maggie on Mythica: a Fairy Tale' (1890); 'Songs Grave and Gay' (1893); 'A Fisherman's Fancies' (1895); 'Mirth and Music' (1901).

Dovizio, Bernardo, bĕr-när'dō dō-vē'tsē-ō. See BIBBIENA.

Dovre-fjeld, dŏv-rĕ-fyĕl', or **Doerines,** an assemblage of mountain masses, Norway, forming the central part of the Scandinavian system, and extending east-northeast from lat. 62° N., where the Langfield terminates, to lat. 63°, where the Koelen begins. It is generally composed of gneiss and mica-schist, and its highest summit is Snehaetten, 7,620 feet.

Dow, or Douw, Gerard, Dutch painter: b. Leyden 7 April 1613; d. there Feb. 1675. He studied under Rembrandt, and was distinguished for the excellence of his coloring and *chiaroscuro.* He surpassed his master in diligence, and nothing can be more finished than his small pieces, which are so delicate that a magnifying-glass is necessary to see distinctly the work in them. His softest figures are full of life, and he never neglected, in his representations, the almost invisible minutiæ of nature. He is regarded as the inventor of the ingenious mode of painting large pictures on a reduced scale, by covering the original with a frame, including a space divided into small quadrangular parts by means of threads, and then transferring the parts into an equal number of similar divisions, drawn on the canvas. He made use of the convex mirror to represent objects on a reduced scale. His works are still among the dearest of the Dutch school. His picture of 'The Fish Merchant' when sold in 1883 brought about $10,000.

Dow, Lorenzo, American preacher: b. Coventry, Conn., 16 Oct. 1777; d. Georgetown, D. C., 2 Feb. 1834. Adopting the doctrines of the Methodists, 1796, he finally received a regular license to preach, and, in spite of contumely and rebuffs, and ceaseless hardships and dangers of all kinds, persevered for nearly 40 years, with an enthusiasm which never relaxed, and often with astonishing effect. In the course of his ministry he traveled over many parts of the United States and Canada, and in 1799 and again in 1805 visited England and Ireland, where his peculiar eloquence attracted much attention and on several occasions subjected him to persecution. Dow's eccentricity of manner and dress for a long time excited a prejudice against him, and in many parts of the country he was familiarly known as "crazy Dow." But to the class whom he most frequently addressed, his simple fervor, though coupled with illiterate phrase-

ology, supplied the place of eloquence, and he seldom failed of having attentive hearers. His journal, containing the history of his life to his 40th year, together with some of his miscellaneous writings, was published in 1856.

Dow, Neal, American temperance reformer: b. Portland, Me., 20 March 1804; d. 2 Oct. 1897. He was the author of the bill which prohibited the manufacture and sale of intoxicating liquors in the State of Maine, widely known as the "Maine Law." During the Civil War he was colonel of a Maine regiment and a brigadier-general of volunteers. In 1880 he was the Prohibitionist candidate for the Presidency.

Dowd, Charles Ferdinand, American educator: b. Madison, Conn., 25 April 1825; d. Saratoga, N. Y., 12 Nov. 1904. He was graduated at Yale in 1853, and for many years was principal of Temple Grove Seminary at Saratoga. He originated the idea of longitude standards for railroad time, and advocated the 24-hour time notation.

Dow'den, Edward, English literary critic and historian: b. Cork, Ireland, 3 May, 1843. He was educated at Queen's College, Cork, and Trinity College, Dublin, and 1867 was elected to the professorship of English Literature in the latter institution, a post he still holds. Besides many valuable articles in periodicals he has published many works on literary subjects, of which the most important are 'Shakspere: His Mind and Art' (1875); 'Poems' (1876); 'Shakspere Primer' (1877); 'Studies in Literature' (1878); 'Southey' (1880); 'Life of Shelley' (1886), the chief authority on the poet's life, being founded on papers in the possession of the Shelley family; 'Transcripts and Studies' (1888); 'Introduction to Shakspere' (1893); 'New Studies in Literature' (1895); 'The French Revolution and English Literature' (1897); 'History of French Literature' (1897); 'Puritan and Anglican' (1900). He has also edited editions of Shelley, Wordsworth, etc. In 1896 he lectured in the United States.

Dowden, John, Scottish prelate: b. Cork, Ireland, 29 June 1840. He is a brother of E. Dowden (q.v.) He was educated at Queen's College, Cork, and Trinity College, Dublin, and taking orders in the Scottish Episcopal Church became Bishop of Edinburgh in 1886. He has published 'The Annotated Scottish Communion Office'; 'The Celtic Church in Scotland'; 'History of the Theological Literature of the Church of England'; 'The Workmanship of the Prayer Book.'

Dower, the estate for life which a widow acquires in a certain portion of her husband's real property after his death. Dower, by the common law of the United States, entitles the widow to a third part of all the lands and tenements of which the husband was seized in fee simple, at any time during the coverture; but the rule varies widely on many particulars in the different States. Tenancy in dower is where a widow takes a third of such lands and tenements of which her husband dies possessed, and in which her title to dower has not been previously barred. Some have ascribed dower to the Normans, but it was first introduced into the feudal system by the German Emperor Frederick II., who was contemporary with Henry III. of England. The person endowed must be the actual wife of the party at the time of his decease. If she be divorced *a vinculo* she shall not be endowed; but a judicial separation does not destroy the dower.

Dowie, John Alexander, American leader of a religious sect: b. Edinburgh, Scotland, 1847. He studied for the ministry, and held two pastorates in Sidney, Australia, but subsequently became an evangelist preacher. While in Australia he organized the International Divine Healing Association of which he became president. In behalf of this association he traveled in England and America, and finally settled in Chicago in 1890. Here he built his wooden "tabernacle" in Woodlawn, which was opened in 1893, and attracted large crowds by his preaching and faith cures. He later organized the Christian Catholic Church in Zion, which grew rapidly, adding many auxiliary lines of work, such as a college for Zion preachers, a training school for deaconesses, and a number of charitable institutions. Dowie had already established a publishing house, which became a part of the organization, and had full control of a bank, known as the Zion bank. He finally organized a land association, and purchased a large tract of land on the shores of Lake Michigan, where he and his devotees are building Zion City, the centre of all the numerous activities of the Christian Catholic Church; here he has also established a lace industry. In this city he is practically dictator, forbids smoking, drinking, card playing, etc., and oversees all branches of the work. He also preaches frequently, and gives special attention to the healing of the sick. In 1901 he made the claim of being "Elijah the Restorer." In 1903 he built the new tabernacle at Zion City, near Chicago, Ill., which he claims is the largest building in the United States devoted exclusively to the worship of God.

Consult Buckley, 'Dowie Analyzed and Classified' ('Century Magazine,' Vol. LXIV., pages 928–32); Napes, 'John Alexander Dowie and his Zions'; ('Independent,' Vol. LIII. p. 1786–91); Swain, 'John Alexander Dowie' ('Century Magazine,' Vol. LXIV. p. 933–44).

Dowitcher, dow'ich-ėr, a sporting name for birds of the genus *Macrorhampus*, which are related to the snipes, and are much hunted along the beaches of this country, during the season. Two species, breeding far north, winter in South America and Mexico. The birds are from 10 to 12 inches long, with a bill nearly one fourth the length of the body. The upper parts are dark, while the under feathers are reddish.

Dow'las, a kind of coarse linen, very commonly worn by the lower classes in the 16th century; also a strong calico made in imitation of the linen fabric. The name is said to be derived from Doullens, a town in the department of Somme, France. Before the introduction of machine-woven cotton cloth, dowlas was manufactured largely in Yorkshire, England, and in the south of Scotland.

Dowler, Bennett, American physician: b. Moundsville, Va., 16 April 1797; d. New Orleans 1879. He graduated from the University of Maryland, and settling in New Orleans founded the New Orleans Academy of Sciences, and was for a number of years editor of the

'Medical and Surgical Journal.' He made a number of experiments with the human body immediately after death, resulting in important discoveries in regard to capillary circulation, contractibility, etc., and also investigated the subject of animal heat. He wrote 'Tableau of the Yellow Fever of 1853' (1854).

Dowletabad, dow-lē-ta-bäd', or **Daulatabad,** India, one of the most remarkable fortresses of India, in the Nizam's Dominions (Haidarabad), 10 miles northwest of Aurangabad. The strong part of it consists of an isolated rock or mass of granite, 500 or 600 feet high, and forming, for about 150 feet, a mural precipice. The only access to the small platform on the summit, is through a low excavation in the heart of the rock. There is a ditch and other works round the base of the rock.

Down, county of Ireland, in the province of Ulster; area 610,730 acres. It possesses good agricultural land, and is rich in minerals. Pop. 289,335.

Downes, William Howe, American journalist art critic: b. Danbury, Conn., 1 March 1854. He has been a staff writer on the Boston *Transcript* for many years. He has published 'Spanish Ways and By-ways'; 'The Tin Army of the Potomac'; 'Arcadian Days'; 'Twelve Great Artists'; and written many papers on art matters for various magazines.

Downfall, The ("La Débâcle"), a novel of the Franco-Prussian war, by Émile Zola, published in 1892. The siege of Sedan forms the dramatic centre of the story, which is concerned chiefly with the friendship of Macquart and Levasseur, and the love of Macquart and Levasseur's sister Henriette.

Downing, Andrew Jackson, American landscape gardener: b. Newburg, N. Y., 20 Oct. 1815; d. near Yonkers, N. Y., 28 July 1852. His 'Landscape Gardening and Rural Architecture' (1841); 'Cottage Residences' (1842); 'Fruits and Fruit Trees of America' (1845); were long considered authorities on the subjects of which they treat.

Downing, Charles, American horticulturist: b. Newburg, N. Y., 9 July 1802; d. there 18 Jan. 1885. In 1837 he established a nursery near the city of Newburg, and remained in the business for 30 years. His experiments resulted in the improvement of many varieties of fruit, and he was regarded as an authority on horticulture and fruit growing. In the later years of his life he contributed articles to various periodicals, and revised and greatly enlarged 'Fruits and Fruit Trees of America,' written by his brother, A. J. Downing (q.v.).

Downing, Fanny Murdaugh, American author: b. Portsmouth, Va., about 1835; d. 1894. She was the author of the novels 'Nameless' (1865), and 'Perfect through Suffering'; and the poems 'The Legend of Catawba' and 'Dixie' (1867).

Downing, R. F., American customs broker and shipper: b. New York 5 May 1849; d. Brooklyn, N. Y., 30 April 1903. He founded the brokerage and shipping firm of R. F. Downing & Co. and with each alteration in the tariff law published the work known as 'Downing's Customs Tariff.'

Downing College, one of the colleges of the University of Cambridge, chartered in 1800 and opened in 1821. Its founder was Sir George Downing, a Cambridgeshire gentleman, grandson of the politician after whom Downing Street in London was named. The objects of the founder were but partially realized, as his legacy was wasted in costly litigation, and in 1903 less than one half of the contemplated quadrangle was completed and there were but few fellows and students.

Downing Street, a short street in Whitehall (named after Sir George Downing, secretary to the treasury in 1667), London, England, where are the colonial and foreign offices, with the official residence since 1735 of the first lord of the treasury. Here cabinet councils are held, hence the term is sometimes employed for the government in office.

Downs, hilly tracts of grassy land suited for pasture; especially two parallel ranges of grassy hills in the south of England, the North Downs running east to west from Hants through Surrey and Kent to Dover, the South Downs in Hants and Sussex, terminating at Beachy Head.

Downs, The, a celebrated roadstead for ships, extending six miles along the southeast coast of Kent, in England, between the North and the South Foreland, where outward and homeward bound ships frequently make some stay, and men-of-war often rendezvous in time of war. It affords excellent anchorage, and is sheltered by Goodwin Sands, but is open to the south. Deal, Dover and Sandown castles are its defense. An obstinate sea-fight took place here in 1666 between the English and Dutch.

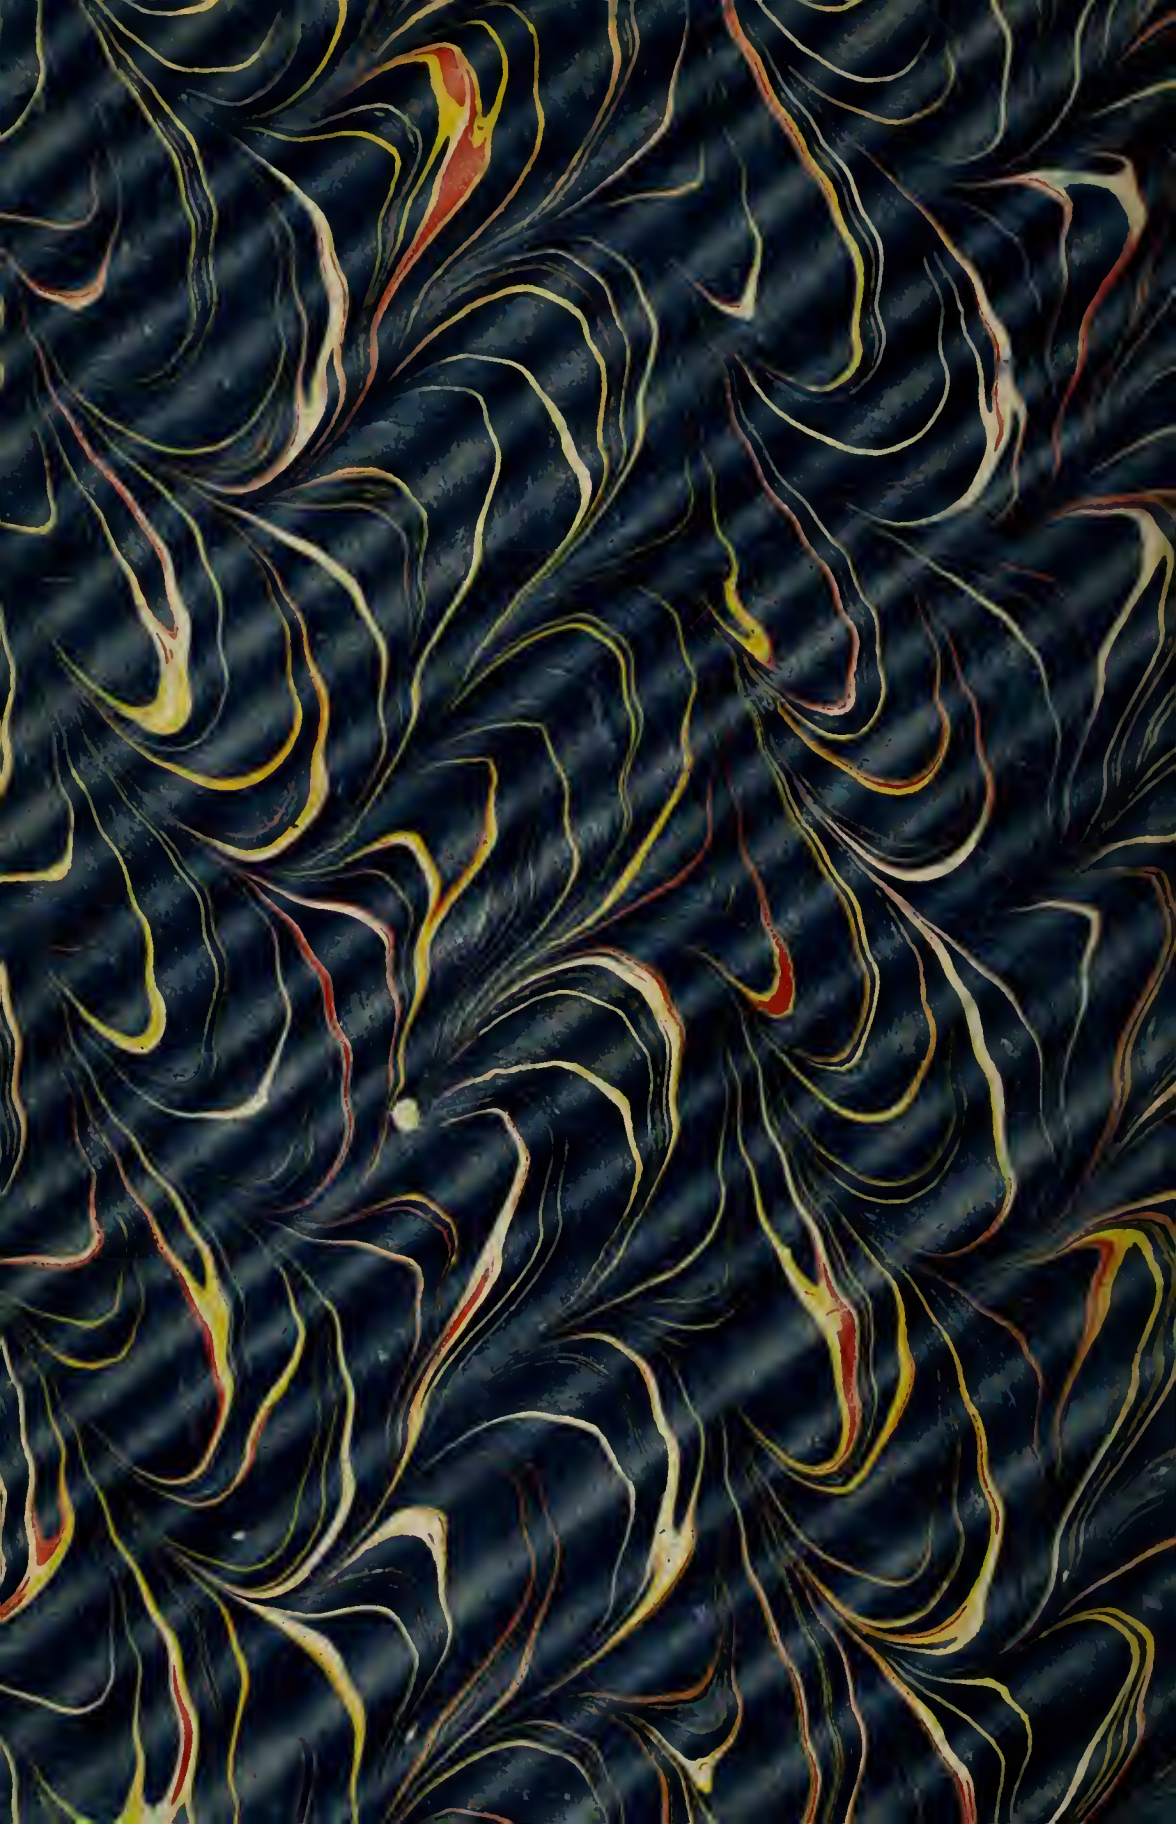
Doxology, an ascription of praise to the Almighty: in particular the Greater Doxology (*Gloria in excelsis*, Glory to God in the highest) and the Lesser Doxology (*Gloria Patri et Filio*, etc., Glory be to the Father and the Son; etc.) The Greater Doxology, as is seen, opens with the words of the evangelist St. Luke when he recounts the circumstances attending the birth of Jesus at Bethlehem; the heavenly host chanting Glory to God in the highest, and on earth peace among men of good will. This Greater Doxology has a place in the Roman Catholic liturgy and in the communion service of the Anglican Church. Its introduction into the liturgy dates only from the time of Pope Symmachus (beginning of 6th century); previously it had been customary to recite it after the Mass. The Lesser Doxology had its origin apparently in the commission given to the Apostles (Matt. xxviii. 19) to teach all nations, baptizing them "in the name of the Father, Son, and Holy Spirit." An ancient form of this Doxology is "Glory to the Father in the Son," and that was considered to be consistent with orthodoxy till the Arians favored it as expressing their view of the relation of Jesus Christ to God the Father: then the orthodox rejected it and employed the other formula exclusively. In the Roman Catholic Breviary at the end of each of the psalms of the daily office the *Gloria Patri*, etc., is always pronounced. The latter portion of this doxology, "as it was in the beginning, is now, and ever shall be. Amen," was appended as a protest against certain hereties of the 6th century who denied the Son's eternity.

Doyen, Gabriel François, gäb-rē-ĕl frän-swä dwä-yäń, French painter: b. Paris 1726; d. St. Petersburg 5 June 1806. After study with Van Loo, he obtained the Grand Prix de

Rome, and spent many years in Italy. His 'Triumph of Amphitrite' is in the Louvre, and his 'Adoration of the Magi' in the museum at Darmstadt. Other noted productions are in various churches, but most famous production, 'Miracle des Ardes,' painted in 1707, being in that of Saint Roch, Paris.

Doyle, Sir Arthur Conan, English novelist: b. Edinburgh, Scotland, 22 May 1859. He is a nephew of Richard Doyle (q.v.). He was educated at the Roman Catholic college at Stonyhurst, Lancashire, and at the University of Edinburgh. After practising as a physician at Southsea (1882–90), the success of several of his books induced him to give up the profession for that of literature. He has published 'A Study in Scarlet' (1887); 'The Captain of the Polestar' (1888); 'Micah Clarke' (1888); 'The Sign of The Four' (1889); 'The White Company' (1890); 'The Firm of Girdlestone' (1890); 'The Adventures of Sherlock Holmes' (1891); a very popular series of detective stories; 'The Refugees' (1891); 'The Great Shadow' (1892); 'Memoirs of Sherlock Holmes' (1893); 'Round the Red Lamp' (1894); 'The Stark Munro Letters' (1895); 'Exploits of Brigadier Gerard' (1896); 'Rodney Stone' (1896); 'Uncle Bernac' (1897); 'The Tragedy of the Korosko' (1898); 'Songs of Action' (1898); 'A Duet with an Occasional Chorus' (1899); 'The Green Flag and Other Stories' (1900); 'The Great Boer War' (1900); 'Cause and Conduct of the War'; 'The Hound of the Baskervilles' (1902); 'Return of Sherlock Holmes' (1904). He has also written the plays, 'A Story of Waterloo' (1894); 'Halves' (1899); etc. He was knighted in 1902.

Doyle, C. W., American physician and author: b. Landour, India, 29 Aug. 1852; d. Santa Cruz, Cal., 1903. He was educated at Calcutta University, studying medicine in London, Edinburgh, and Aberdeen. He was graduated from the latter in 1875, and practised in England till 1888, when he went to California, continuing his practice there. He has published much verse and prose in the magazines, and the volumes 'The Taming of the Jungle' (1889); 'The Shadow of Quong Lung' (1899).



Doyle, Sir Francis Hastings Charles, English poet: b. Nunappleton 1810; d. 8 June 1888. He was educated at Eton and Oxford, held the post of receiver-general and next of commissioner of customs, and in 1867 he was elected to the chair of poetry in Oxford University for the term of five years, being then elected for a second term of the same duration. He had already published 'Miscellaneous Verses' (1841); 'Two Destinies' (1844); 'The Return of the Guards and other Poems' (1866); and he subsequently published his Oxford lectures (1869 and 1877), and 'Reminiscences and Opinions 1813–85' (1886).

Doyle, John, English caricature artist: b. Dublin 1797; d. 2 Jan. 1868. After studying art in his native city he went to London in 1821, and produced a series of caricatures which became famous as the "H. B." caricatures from the initials attached to them, the identity of the artist remaining unknown. From 1829 to 1851 all the politicians of note were in this way gently and cleverly satirized, always within the limits of good taste and gentlemanly feeling. These works, which were executed by means of lithography, appeared in sets of four or five at a time, and ultimately the plates amounted to over 900 in number.

Doyle, John Andrew, English historian: b. 14 May 1844. He was educated at Eton and Balliol College, Oxford. He has published 'The American Colonies' (1869); 'A History of the United States' (1875); 'The English in America,' Vol. I.; 'Virginia, Maryland and the Carolinas' (1882), Vol. II.; 'The Puritan Colonies' (1887).

Doyle, Richard, English artist: b. London Sept. 1826; d. there 11 Dec. 1883. His father, John Doyle (q.v.), the author of the celebrated "H. B." caricatures, initiated him into the mysteries of his art, and the young draughtsman became one of the founder-illustrators of 'Punch,' the current design on the cover of which was invented by him. His sketches of the 'Manners and Customs of ye English' in that periodical, and the 'Bird's-eye Views of Society' in the early pages of the 'Cornhill Magazine,' illustrate the mode of life and manners of London men and women of his time with rare felicity and fidelity. In 1850 he severed his connection with 'Punch' on account of its frequent attacks on the Pope and Doyle's co-religionists, the Roman Catholics. From that time he contributed many illustrations to books. His water-color pictures of fairy lore are well known.
